Nashville, Tennessee 37211

CERTIFICATION STATEMENT

This 2026 Semi-Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Company - Plant Bowen Solid Waste Disposal Facility Landfill Cells 1-10 has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule (Title 40 Code of Federal Regulations [40 CFR] 257 Subpart D, specifically § 257.90[e]) and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with Stantec Consulting Services Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management 391-3-4-.10.

Executive Summary

This summary of the *2026 Semi-Annual Groundwater Monitoring and Corrective Action Report* provides the status of the groundwater monitoring and corrective action program from January through June 2026 at the Georgia Power Company (Georgia Power) Plant Bowen Landfill Cells 1–10 (the Landfill or the Site). This summary was prepared by Stantec Consulting Services Inc. (Stantec) on behalf of Georgia Power to meet the requirements listed in Part A, Section 6[1] of the United States Environmental Protection Agency (US EPA) coal combustion residuals (CCR) rule Title 40 Code of Federal Regulations (40 CFR) 257 Subpart D (CCR Rule) and the Georgia Environmental Protection Division (GA EPD) Rules of Solid Waste Management 391-3-4-.10.

The Landfill is located in Bartow County off State Highway 113, approximately seven miles west-southwest of Cartersville, Georgia, and 20 miles southeast of Rome, Georgia. The Landfill receives coal combustion by-products, coal ash, and gypsum from coal power generating processes at Plant Bowen. The landfill cells are lined in accordance with Permit No. 008-018D (CCR). Gypsum placement in disposal Cells 1 & 2 began in November 2008, whereas ash placement in disposal Cells 3 & 4 began in February 2015. Waste placement operations were initiated in Cells 9 & 10 in November 2015. Waste placement operations for Cells 5 & 6 were initiated in April 2025, and Cells 7 & 8 are currently under construction. The Site is located in the northeastern portion of the Plant Bowen property.

Plant Bowen Landfill Cells

The groundwater monitoring program for the Landfill is currently managed in accordance with CCR Permit No. 008-018D (CCR) approved on December 8, 2022. Groundwater at the Site is monitored using a groundwater monitoring system of wells installed to meet federal and state monitoring requirements. Groundwater monitoring, in accordance with the previous Georgia Solid Waste Permit No 008-018D (LI), began in 2007 prior to disposal activities and continues to date under the 2022 CCR Permit Groundwater Monitoring Plan (GWMP) with revisions being approved June 2026. Routine sampling and reporting for CCR Rule Appendix III constituents began after the background groundwater conditions were established between February 2016 and August 2017 for Cells 1 & 2, 3 & 4, and 9 & 10. Additional wells were installed in support of the expansion of Cells 5–8 in April–May of 2023 and August–October of 2025. Background groundwater sampling for the wells installed between August and October 2025 began in February-March 2026 in accordance with § 257.94.

[1] 80 FR 21468, Apr. 17, 2015, as amended at 81 FR 51807, Aug. 5, 2016; 83 FR 36452, July 30, 2018; 85 FR 53561, Aug. 28, 2020

2026 Semi-Annual Groundwater Monitoring and Corrective Action Report
Plant Bowen Landfill Cells 1–10

During the 2026 semi-annual reporting period, one groundwater sampling event was conducted in February-March 2026 for Cells 1-10. Groundwater samples collected during the event were submitted to Pace® Analytical Services, LLC. (Pace), for analysis of Appendix III parameters[2] .Per the CCR Rule, the groundwater analytical results were evaluated in accordance with certified statistical methods. Verified Appendix III constituents with statistically significant increases (SSIs) are provided in the table below and are addressed by Alternate Sources Demonstrations (ASD) submitted in April 19, 2018 and November 22, 2024.

Appendix III Constituents (SSIs)	February-March 2026
Calcium	GWC-23R
pH	GWC-44

Based on review of the Appendix III statistical results completed for the groundwater monitoring and corrective action program during the semi-annual reporting period, the Landfill will continue in detection monitoring.

1 Introduction

This *2026 Semi-Annual Groundwater Monitoring and Corrective Action Report* has been prepared by Stantec Consulting Services Inc. (Stantec) on behalf of Georgia Power Company (Georgia Power) to document groundwater monitoring activities conducted from January through June 2026 at Georgia Power's Plant Bowen Landfill Cells 1–10 (Landfill or Site). The groundwater monitoring activities were conducted to comply with the current coal combustion residuals (CCR) Permit No. 008-018D (CCR), approved by the Georgia Environmental Protection Division (GA EPD) on December 8, 2022, and in accordance with the United States Environmental Protection Agency (US EPA) Title 40 Code of Federal Regulations (40 CFR) 257 Subpart D (CCR Rule) and the GA EPD Rules of Solid Waste Management 391-3-4-.10. This report satisfies the reporting requirements of applicable GA EPD Solid Waste Management Rules (391-3-4-.10) and federal CCR Rule 40 CFR 257.90(e).

1.1 Site Description and Background

The Plant Bowen Landfill is a Georgia Power-owned property located in Bartow County off State Highway 113, approximately seven miles west-southwest of Cartersville, Georgia, and 20 miles southeast of Rome, Georgia (**Figure 1**). The Landfill is approximately 300 acres located in the northeast portion on a previously undeveloped, contiguous section of the plant property. The Landfill receives coal combustion by-products, coal ash, and gypsum from coal power generating processes at Plant Bowen. The landfill cells are lined in accordance with Solid Waste Permit No. 008-018D (CCR). Cells 3 & 4 and 9 & 10 have a leachate collection system. Gypsum placement in disposal Cells 1 & 2 began in November 2008, whereas ash placement in disposal Cells 3 & 4 began in February 2015. Waste placement operations were initiated in Cells 9 & 10 in November 2015. In 2020, GA EPD approved the placement of waste following a retrofit of Cells 9 & 10 with a leachate collection system. Cells 9 & 10 are used to store bottom ash. Landfill expansion activities at Cells 5 & 6 and 7 & 8 began with land clearing, installation of monitoring wells, and construction of Cells 5 & 6, which includes a liner and leachate collection system. Monitoring well installation for landfill Cells 5 & 6 and 7 & 8 occurred in April and May 2023 and has been followed by nine background groundwater sampling events through March 2025, fulfilling requirements per the site permit. In late April 2025, active placement of waste was initiated in Cells 5 & 6. As of August 2026, Cells 7 & 8 are still under construction.

1.2 Regional Geology and Hydrogeologic Setting

The regional geology and hydrogeology of the Plant Bowen Landfill area are summarized below. The Site lies within the Valley and Ridge physiographic province about three to four miles north of the Cartersville Fault (Georgia Power 2022). The Cartersville Fault separates the late Precambrian-aged metamorphic rocks to the east and south from the Cambrian-aged sedimentary rocks to the north-northwest and west (Croft 1963). Two main geologic layers are present at the Site: overburden (residuum clay and partially weathered rock) and carbonate bedrock (dolomite and limestone).

As described in the Composite Site Acceptability Report for CCR Landfill Permit (Georgia Power 2022), the lithologies present in the landfill area of Plant Bowen from the ground surface to depth are terrace deposits, a residuum clay overburden, dolomite, and limestone bedrock. The Knox Group (dolomite and limestone bedrock) produces a characteristic orange to red clayey residuum (overburden soil) that ranges

in thickness from 19 to 127 feet across the Site and often contains weathered chert and dolomite fragments. Silt and clay with some gravel and sand (terrace deposits) overlay the clayey residuum in some areas but are not continuous across the landfill area of Plant Bowen.

The uppermost aquifer for groundwater monitoring purposes is unconfined and, depending on the variability of weathering characteristics, the groundwater surface may occur in the overburden or carbonate bedrock. The water table commonly occurs in the overburden, but at some locations the water table is near the overburden-bedrock interface or in the upper fractured bedrock. Based on these data and field observations, it is assumed that the overburden and upper fractured bedrock are a single, interconnected water bearing zone below the unsaturated overburden. Overburden materials are heterogeneous, ranging in composition from well-graded gravelly sand to fat clay. Bedrock underlying the Site (officially mapped as Knox undifferentiated) is a carbonate bedrock (limestone and dolomite). The local karst geology features massive limestone and dolostone beds with chert, calcite, and fractures and void spaces that were observed during well installation activities. Karst features within the underlying carbonate bedrock are predominately formed along initial discontinuities including joints, fissures (slots), fractures, and bedding planes or other linear features. These karst features may be partially or completely filled with soft unconsolidated solids, empty, or filled with water. The top of the karst features is usually identified as having a thin zone of weathered carbonate bedrock. The karst features are primarily vertically oriented and generally infilled where present (Georgia Power 2022).

1.3 Groundwater Monitoring System

The existing groundwater monitoring system meets the requirements listed in § 257.91 and 391-3-4.10. A groundwater monitoring system was installed at the Landfill that consists of a sufficient number of wells installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer to represent the groundwater quality both upgradient of the unit (i.e., background conditions) and passing the waste boundary of the unit. The number, spacing, and depths of the groundwater monitoring wells were selected based on the characterization of site-specific hydrogeologic conditions.

A subset of the wells is equipped with data loggers and telemetry systems for water level measurements and data transmission for real-time monitoring of groundwater levels in the subsurface karst geology.

The locations of monitoring wells included in the groundwater monitoring system are presented in **Figure 2**. Well construction details are listed in **Table 1**.

Based on GA EPD comments, three detection wells (GWC-25, GWC-31S, and GWC-58) were installed between August and October 2025 and are described further in Section 2.

2 Groundwater Monitoring Activities

The following sections describe monitoring-related activities performed from January through June 2026. Samples were collected in February–March from each of the wells at Landfill Cells 1–10. A verification sampling event was conducted in May 2026 for beryllium at GWC-5 and mercury at GWC-48. The groundwater monitoring system is shown in **Figure 2**. **Table 2** presents a summary of the groundwater sampling events completed for the Landfill during this monitoring period.

2.1 Monitoring Well Installation and Maintenance

Monitoring wells are inspected semi-annually to determine if repairs or corrective actions are necessary to meet the requirements of the Georgia Water Well Standards Act (O.C.G.A. § 12-5-134(5)(d)(vii)). In February 2026, monitoring wells were inspected, and no corrective actions were required. Previous reporting indicated localized flooding had been observed and noted during the inspection of GWC-34 and GWC-34R. Drainage improvements in the area of GWC-34 and GWC-34R were completed in April 2026 to prevent future flooding of the well pads. The well inspection forms and the well maintenance and repair memorandum for GWC-34 and GWC-34R are included in **Appendix A**.

Groundwater wells GWC-25, GWC-31S, and GWC-58 were installed in August–October 2025. A well installation report documenting the installation of wells GWC-25, GWC-31S, and GWC-58 has been provided to GA EPD under separate cover as described in the *Groundwater Monitoring Plan* (GWMP) (Stantec 2026a), with revisions approved by GA EPD in June 2026. The February–March 2026 groundwater sampling event represents the first of eight baseline sampling event for wells GWC-25, GWC-31S, and GWC-58 following well installation.

2.2 Detection Monitoring Program

Groundwater monitoring began in 2007 prior to disposal activities, in accordance with the previous Georgia Solid Waste Permit No. 008-018D (LI), and continues to date under the current CCR Permit No. 008-018D (CCR). Groundwater monitoring and reporting activities, conducted in accordance with § 257.90 through § 257.94 of the federal CCR Rule, were initiated in 2016. Pursuant to § 257.94(b), eight baseline sampling events were conducted from February 2016 to August 2017 at Cells 1 & 2, 3 & 4, and 9 & 10, with the initial detection monitoring event occurring in September–October 2017. Pursuant to § 257.94(b), a total of eight to nine baseline sampling events were conducted from June 2023 to March 2025 at Cells 5 & 6 and 7 & 8. Onset of waste placement at Cells 5 & 6 began in April 2025, and the initial detection monitoring event occurred in August 2025. Detection monitoring for the three new wells installed in Cells 5–8 in August–October 2025 (GWC-25, GWC-31S, and GWC-58) began in February 2026 and will consist of a minimum of eight baseline sampling events in accordance with the GWMP.

Georgia Power currently monitors groundwater associated with Landfill Cells 1–10 under the detection groundwater monitoring program in accordance with § 257.94 and Solid Waste Management Rule 391-3-4-.10(6). During the reporting period, a semiannual detection monitoring event occurred in February–March 2026. Groundwater samples were collected from monitoring wells in the groundwater monitoring system (**Figure 2**) and analyzed for

- CCR Rule Appendix III constituents.

- A state-modified Appendix I list of detection constituents according to the approved *Plant Bowen CCR Landfill GWMP* with revisions approved by *GA EPD in June 2026* (Stantec 2022, Stantec 2026a). The analyte list includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc.
- Field parameters recorded during sampling, including pH, temperature, turbidity, dissolved oxygen (DO), specific conductance, and oxidation-reduction potential (ORP).

2.3 Additional Sampling and Analyses

An ephemeral spring at the Site, shown on **Figure 2**, is checked for water during each groundwater sampling event. Insufficient water volume for sampling was present in the spring during the February–March sampling event; therefore, no samples were collected.

In addition to routine Appendix I and CCR Rule Appendix III constituents, groundwater samples from the February–March 2026 semi-annual event were analyzed for alkalinity, major cations (magnesium, sodium, potassium), iron, and manganese. The chemical composition of groundwater based on major ion chemistry data will be used to evaluate groundwater quality. Results are included in laboratory reports discussed in Section 3.5.

3 Sample Methodology & Analyses

This section presents a summary of the field sampling methodology and the groundwater sampling results during the reporting period from January through June 2026.

3.1 Groundwater Elevation Measurements and Flow Direction

Prior to each sampling event, groundwater levels were recorded at each accessible monitoring well and piezometer at the Landfill. The calculated groundwater elevations for the February 2026 gauging event are presented in **Table 3**.

The groundwater elevation data from February 2026 were used to develop a potentiometric surface elevation contour map (**Figure 3**). Review of **Figure 3** shows that groundwater elevations vary between landfill cells due to topographic variations. Groundwater elevations are similar between the overburden and the upper bedrock at most onsite locations indicating hydraulic communication between the saturated overburden and upper bedrock.

The general direction of groundwater flow in the overburden of the Landfill Cells 1 & 2 and 9 & 10 area is to the northeast and to the north-northeast for bedrock. Overburden and bedrock groundwater generally flow toward the Etowah River to the north, east, and south-east of the Site with semi-radial flow from Cells 3 & 4, 5 & 6, and 7 & 8. Observed groundwater elevations are consistent with previous observations.

3.2 Groundwater Gradient and Flow Velocity

The groundwater flow velocity at the Site was calculated using a derivation of Darcy's Law. Specifically,

$$V = \frac{K * i}{n_e}$$

Where

$V =$ Groundwater flow velocity $\left(\frac{feet}{day}\right)$.

$K =$ Average horizontal hydraulic conductivity of the aquifer $\left(\frac{feet}{day}\right)$.

$i =$ Horizontal hydraulic gradient $\left(\frac{feet}{foot}\right)$.

$n_e =$ Effective porosity.

The general groundwater flow velocity that was calculated for the Site is based on hydraulic gradients estimated from February 2026 groundwater level measurement data. A summary of the calculations is provided in **Table 4**. Average hydraulic conductivity values were based on previous slug test results in addition to data from the slug tests of the three newly installed wells, conducted in October and November of 2025. An estimated effective porosity of 0.01 (based on default soil type value for silty clays to clays in US EPA 530/SW-89-031 [US EPA 1989]) for the screened horizon was used. The sitewide geometric mean for hydraulic conductivity used to calculate the horizontal groundwater flow rates at the Site (6.4×10^{-5} centimeters per second [cm/sec] = 0.18 feet per day [ft/day]) was recently updated in the

Summary of Geologic and Hydrologic Conditions Addendum report (Stantec 2026b). Results for groundwater flow velocities range from a non-detectable value (based on a hydraulic gradient during the February 2026 event that was essentially flat) to approximately 0.10 ft/day (**Table 4**).

The hydraulic gradients in this report have been calculated between an upgradient and downgradient well pair selected to provide the most accurate alignment possible relative to the interpreted groundwater flow path.

Groundwater flow in the Knox Dolomite Formation, underlying the Site, occurs in joints, fractures, bedding planes, and solution channels (Croft 1963). These pathways can facilitate relatively higher groundwater flows in the upper fractured bedrock. However, the flow rates noted in the wells screened in the upper fractured bedrock (**Table 4**) also suggest an abundance of residual clays in the zone where the top of the carbonate bedrock is weathered.

3.3 Continuous Water Level Monitoring (Hydrogeologic Monitoring)

Georgia Power continuously monitors groundwater level fluctuations in accordance with the GWMP (Stantec 2022). The hydrogeologic monitoring network provides water level data, which are evaluated for changes in subsurface hydrologic conditions. The hydrogeologic data are evaluated weekly and reported semi-annually.

3.3.1 HYDROGEOLOGIC MONITORING NETWORK

Hydrogeologic monitoring locations for Cells 1–10 were selected following analysis of the interim data and review of historical groundwater elevations and potentiometric surface maps. Across the landfill cells, there are a total of 37 wells as of June 6, 2026, that are currently equipped with transducers for monitoring water levels.

For the hydrogeologic monitoring network, Georgia Power utilized In-Situ VuLink® telemetry systems relaying data to an In Situ® database website (HydroVu®) where the telemetry data are stored and compiled. Each Level Troll 500 transducer was deployed in a monitoring well at a fixed depth. Groundwater levels were recorded multiple times daily from each well transducer, and each transducer was programmed to record fluctuations in water levels of ± 0.5 foot occurring within four-hour recording schedules. The telemetry system relays water level data via cellular network to a central data storage unit that can be accessed in real-time over the internet; whereby, the data can be checked for anomalous groundwater level fluctuations. Groundwater elevations, along with the river stage elevations and rainfall data, recorded between December 7, 2025, and June 6, 2026, are provided in a monitoring report for the landfill cell units in **Appendix B**.

During the annual reporting period, transducers from wells GWC-11R, GWC-16R, GWA-33, and GWA-39Z had minor issues with the telemetry systems and data upload. Southern Company Services (SCS) staff corrected these issues, and data logging and transmission has been reestablished. Details on transducer maintenance and repair are provided in **Appendix B**.

In addition to collecting transducer data, Etowah River level data for the reporting period were obtained from an on-site transducer at a location near the river intake pumping structure and are presented in **Table 3** and **Figure 3**. Daily total precipitation data were obtained from U.S. Geological Survey station gauge #02394670 on the Etowah River at Georgia Route 61.

3.3.2 HYDROGEOLOGIC MONITORING RESULTS

During the 2025–2026 semi-annual monitoring period from December 7, 2025, through June 6, 2026, the hydrogeologic monitoring network pressure transducers were operational and collected continuous groundwater elevation data, with the exceptions described in **Appendix B** and in Section 3.3.1. **Table 1** in the Hydrogeologic Monitoring Report (**Appendix B**) lists identified data anomalies, their causes, and maintenance efforts during the monitoring period. Observed disruptions in the transducer water levels were found to be directly attributed to (a) drawdown during sampling events, water level gauging, and well development, (b) maintenance of wells, transducers, or telemetry units, or (c) rainfall events (greater than 1.5 inches of rain). Hydrogeologic monitoring data for the 2025–2026 semi-annual monitoring period did not show water level fluctuations or sudden decreases in groundwater elevation data attributable to subsurface changes that might be indicative of land subsidence or sinkhole formation.

3.4 Groundwater Sampling

During the 2026 semi-annual reporting period, groundwater samples were collected during one detection monitoring event conducted in February–March 2026. One verification event occurred in May 2026. The May 2026 verification event included beryllium for GWC-5 and mercury for GWC-48. Sampling procedures were conducted in accordance with US EPA Region 4 Laboratory Services and Applied Science Division operating procedures (US EPA 2023, 2024). Monitoring wells were purged and sampled using low-flow sampling procedures. Dedicated pneumatic bladder pumps, non-dedicated pneumatic bladder pumps, or peristaltic pumps were used to purge and sample the wells. An AquaTroll® (In-Situ® field instrument) was used to monitor and record field water quality parameters (pH, specific conductance, DO, temperature, and ORP) and a LaMotte 2020 (or similar) was used to measure turbidity during well purging to verify stabilization prior to sampling.

Groundwater samples were collected when the following stabilization criteria were met for three consecutive readings.

- pH ± 0.1 Standard Units
- Specific conductance ± 5%
- ± 0.2 mg/L or ± 10% for DO > 0.5 mg/L (whichever is greater); for DO < 0.5 mg/L, record only, no stabilization criterion
- Turbidity measurements less than five Nephelometric Turbidity Units (NTUs) or between five and ten NTUs after three hours of purging
- Temperature – Record only, not used for stabilization criteria
- ORP – Record only, not used for stabilization criteria

Once stabilization was achieved, samples were collected into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Pace® Analytical Services, LLC. (Pace) following standard chain-of-custody protocol. Field parameter logs and equipment calibration forms are included in **Appendix C**.

3.5 Laboratory Analyses

Laboratory analyses were performed by Pace, an accredited laboratory by National Environmental Laboratory Accreditation Program (NELAP) that maintains a NELAP certification for the constituents analyzed. In addition, Pace is certified to perform analysis by the state of Georgia. Groundwater data laboratory reports and chain-of-custody records for the monitoring event are presented in **Appendix C**.

The groundwater analytical results from the 2026 semi-annual reporting period are summarized in **Table 5**. The pH field measurements recorded during the detection monitoring and verification events are also provided in **Table 5**. The ephemeral spring had insufficient water during the February–March 2026 sampling event and no sample was collected. Historical analytical data of the spring is provided in **Appendix D**. The spring lacked sufficient water and was not sampled for events not included in **Appendix D**.

3.6 Quality Assurance & Quality Control

During each sampling event, quality assurance/quality control (QA/QC) samples were collected. Equipment blanks were collected at a rate of one QA/QC sample per ten groundwater samples. Blind field duplicate samples were collected by filling additional containers at the same location during the sampling event at a rate of one QA/QC sample per ten groundwater samples. Field blanks were also collected to evaluate ambient conditions at the sampling locations at a rate of one QA/QC sample per ten groundwater samples.

QA/QC of the groundwater data were assessed by performing a data quality evaluation of the reported laboratory results. A data quality evaluation was conducted on the data using laboratory precision and accuracy and analytical method requirements (US EPA 2002). In addition to collecting QA/QC samples, the data were validated based on the pertinent methods referenced in the laboratory reports, professional and technical judgment, and applicable federal and site-specific guidance documents (US EPA 2023, 2024). The validated data meet project objectives. The data quality evaluations are included in **Appendix C**.

4 Statistical Analysis

This section presents a summary of the statistical approach applied to assess the 2026 semi-annual groundwater data for potential statistically significant increases (SSI) of permit stipulated constituents reported in downgradient compliance wells relative to the available historical dataset. The statistical analyses used at the Site for Appendix I and Appendix III constituents were conducted pursuant to 40 CFR § 257.93 in accordance with the Statistical Analysis Method Certification (certified by a registered Professional Engineer) and based on methodology presented in the GWMP (Stantec 2022). Statistical analysis techniques are consistent with the methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities*, Unified Guidance, March 2009, EPA 530/R-09-007 (US EPA 2009), hereinafter referred to as the Unified Guidance.

4.1 Statistical Methods

Statistical analyses of groundwater quality data for the 2026 semi-annual reporting period are provided in the Groundwater Stats Consulting, LLC Statistical Analysis Reports presented in **Appendix E**. **Table 6** provides a summary of the statistical methodology used at the Site for the 2026 semi-annual groundwater events. Sanitas™ groundwater statistical software was used to perform the statistical analyses. Sanitas™ is a commercially available decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by US EPA regulations and guidance as recommended in the Unified Guidance (US EPA 2009). Detailed statistical methods used for Appendix I and Appendix III constituents are discussed in statistical analysis packages provided in **Appendix E** and summarized in Section 4.1.1.

4.1.1 APPENDIX I AND APPENDIX III STATISTICAL METHOD

Intrawell and interwell methods were used to analyze the February–March 2026 detection groundwater monitoring event results, as summarized in **Table 6**. Eligibility for intrawell methods is discussed in detail in the Statistical Analysis Reports (**Appendix E**).

In instances where a potential SSI was identified by intrawell statistical methods, interwell statistical methods were used as a second step to determine if the initial potential SSI was below a sitewide background limit. If the concentrations were above both the intrawell and interwell prediction limits, then an additional verification sampling (i.e., one of two resampling) was collected to verify the potential SSI. When a resample analytical result was below the intrawell prediction limit, then the result was not declared an SSI. If the resample analytical result was above the prediction limit or a resample was not collected, then the SSI would be verified and declared.

In instances where a potential SSI was identified by interwell statistical methods, a verification resample was collected to verify the initial result. When a resample analytical result was below the prediction limit, then the result was not declared an SSI. If the resample analytical result was above the prediction limit or a resample was not collected, then the SSI was verified and declared.

Background data were evaluated using the Sen's Slope/Mann Kendall or linear regression trend test to confirm suspected increasing or decreasing trends (**Appendix E**). The distribution of the data determined which trend test was used.

4.2 Statistical Analyses Results

Using the statistical analysis approach described in Section 4.1 for the detection monitoring data and associated verification data, potential SSIs from the February–March 2026 event for Appendix I and Appendix III constituents are presented in **Table 7** and **Table 8** below. Potential SSIs addressed by previously submitted alternate source demonstrations (ASDs) or not verified via resampling are indicated in the footnotes.

Bartow County, Georgia

Appendix III Constituents	Downgradient Wells with Potential SSIs
Cells 1 & 2 and 9 & 10	
pH	GWC-44**
Cells 3–8	
Calcium	GWC-23R**

** ASD previously submitted. Refer to Section 5 for more information.

5 Alternate Source Demonstration

ASDs were previously submitted to GA EPD under separate report covers to address potential SSIs of Appendix I and Appendix III constituents. Based on GA EPD guidance, ASDs no longer require concurrence if an SSI has not been detected for two consecutive events, which indicates natural variability. SSIs confirmed during this reporting period are addressed by previous ASDs listed below. SSIs addressed in previous ASDs that were confirmed during this reporting period are noted in **Table 9**.

TABLE 9.
SSIs ADDRESSED IN PREVIOUS ASDs
Plant Bowen Landfill Cells 1–10
Bartow County, Georgia

Alternate Source Demonstration	Constituent	Well	Status of Approval by GA EPD
Wood Environment & Infrastructure Solutions, Inc., Alternate Source Demonstration Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 Solid Waste Disposal Facility Permit No. 008-018D (LI), April 19, 2018	Calcium	GWC-23R	Approved 1/30/2019
Wood Environment & Infrastructure Solutions, Inc., Alternate Source Demonstration Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10 Solid Waste Disposal Facility Permit No. 008-018D (LI), April 19, 2018	pH	GWC-44	Approved 1/30/2019
Stantec, Alternate Source Demonstration for Mercury, February 2024 Semi-Annual Event, November 22, 2024	Mercury	GWC-48	Submitted

6 Monitoring Program Status

Groundwater monitoring for the Plant Bowen Landfill Cells 1–10 is in the detection monitoring phase. The three wells installed in Cells 5–8 in August–October 2025 (GWC-58, GWC-31S, and GWC-25) began background monitoring in February 2026. Potential SSIs of Appendix I constituent mercury and Appendix III constituents calcium and pH were identified during the semi-annual sampling events and were addressed in previously submitted ASDs, as described in Section 5.0. Groundwater monitoring at Plant Bowen Landfill Cells 1–10 will continue in the detection monitoring phase.

7 Conclusions & Future Actions

This 2026 Semi-Annual Groundwater Monitoring and Corrective Action Report for Georgia Power's Plant Bowen Landfill Cells 1–10 was prepared to fulfill the requirements of applicable federal and state CCR Rules and GA EPD Solid Waste Management Rules (40 CFR § 257.90[e] and 391-3-4-.10).

During the semi-annual monitoring event in February–March 2026, potential SSIs of Appendix I and Appendix III constituents were addressed by previously submitted ASDs (mercury, calcium, and pH). The potential SSIs identified during the semi-annual reporting period are not thought to be the result of a release from Landfill Cells 1–10 and are attributed to natural variability of groundwater chemistry underlying the Site combined with poor drainage around GWC-48, which was corrected in June 2025. Groundwater monitoring at Plant Bowen Landfill Cells 1–10 will continue in the detection monitoring phase. The next semi-annual groundwater monitoring event is tentatively scheduled for August 2026.

Notes:
Elevations shown are in datum NAVD88, which indicates feet (ft) in elevation referenced to the North American Vertical Datum 1988.
Georgia State Plane NAD83 West Zone referenced for horizontal datum.
Survey points measured at nail or known reference point.
Groundwater Zone Screened references USCS ASTM 2488 Visual Manual Group Symbol or well survey.
Well screen elevations are calculated by subtracting the depths to top and bottom of the well screen from the ground surface elevation.

GWC-49R	709.56	58.39	651.17
GWC-49Z	709.11	57.73	651.38

Notes:
NAVD88 indicates feet (ft) in elevation referenced to the North American Vertical Datum 1988.
NA - GWC-23R groundwater elevation is not shown; water level was below the top of the dedicated pump.
The surface water elevation at the Etowah River gauging location (Northing 1504757.08, Easting 2068108.55, NAD 1983) was recorded as 645.04 feet on February 11, 2026.

Table 4
2026 Groundwater Flow Velocity Calculations
Georgia Power Company
Plant Bowen - Landfill Cells 1-10
Bartow County, GA

Flow Paths		Groundwater Measurement Date	Groundwater Elevations in Well Pairs (h1, h2) (feet)		Change in Elevation (Δh) (feet)	Distance Measured (L) (feet)	Hydraulic Gradient (i) (feet/foot)	Estimated Sitewide Hydraulic Conductivity (K) (feet/day) [1]	Estimated Effective Porosity (ne) [2]	Calculated Groundwater Flow Velocity (V) (feet/day)	Calculated Groundwater Flow Velocity (V) (feet/year)
Landfill Cells 1 & 2	GWA-39RZ to GWC-10R	2/11/2026	663.62	651.27	12.35	2960	0.00417	0.18	0.01	0.075	27
Landfill Cells 3 & 4	GWC-37 to GWC-18	2/11/2026	649.93	647.33	2.60	1038	0.00250	0.18	0.01	0.045	16
Landfill Cells 5 & 6 and 7 & 8	GWC-31S to GWC-31	2/11/2026	650.40	650.40	0.00	42	0.0000	0.18	0.01	0.00	0
Landfill Cells 9 & 10	GWA-40 to GWC-47	2/11/2026	657.63	647.80	9.83	1786	0.005504	0.18	0.01	0.10	36

Notes:

1. The estimated sitewide hydraulic conductivity values of 0.18 ft/day is the geometric mean of slug testing data in the 2025 Summary of Geologic and Hydrologic Conditions Addendum, and additional slug testing completed in 2015, 2016, 2024 and 2025.

2. An estimated effective porosity of 0.01 (based on default soil type value for silty clays to clays in USEPA 530/SW-89-031) of the screened horizon.

Notes:

mg/L - milligrams per liter

SU - Standard Units

NA - Indicates not analyzed

TDS - Total Dissolved Solids

< indicates the substance was not detected above the method detection limit (MDL). The value displayed is the MDL.

J - The result is an estimated concentration. “J” qualifiers are applied by the laboratory when the concentration reported is above the method detection limit, but below the laboratory reporting limit.

Notes:

mg/L - milligrams per liter

SU - Standard Units

NA - Indicates not analyzed

TDS - Total Dissolved Solids

< indicates the substance was not detected above the method detection limit (MDL). The value displayed is the MDL.

J - The result is an estimated concentration. “J” qualifiers are applied by the laboratory when the concentration reported is above the method detection limit, but below the laboratory reporting limit.

Sodium	mg/L	1.4	10	1.3	2.0	2.0	2.9	2.7

Notes:

mg/L - milligrams per liter

SU - Standard Units

NA - Indicates not analyzed

TDS - Total Dissolved Solids

< indicates the substance was not detected above the method detection limit (MDL). The value displayed is the MDL.

J - The result is an estimated concentration. "J" qualifiers are applied by the laboratory when the concentration reported is above the method detection limit, but below the laboratory reporting limit.

Notes:

mg/L - milligrams per liter

SU - Standard Units

NA - Indicates not analyzed

TDS - Total Dissolved Solids

< indicates the substance was not detected above the method detection limit (MDL). The value displayed is the MDL.

J - The result is an estimated concentration. "J" qualifiers are applied by the laboratory when the concentration reported is above the method detection limit, but below the laboratory reporting limit.

Table 6
Statistical Method Summary
Georgia Power Company
Plant Bowen – Landfill Cells 1-10
Bartow County, GA

Statistical Methodology	Data Screening on Proposed Background	Evaluate outliers, trends, and seasonality when sufficient data are available
	Statistical Limits	Interwell statistical limits are applied on a parameter basis, depending on the appropriateness of the method as determined by the Analysis of Variance. Intrawell statistical limits are applied on a parameter basis, depending on the appropriateness of the method.
	Prediction Limits	When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit. Non-parametric means data sets contain greater than 50% non-detects or data are not normally or transformed-normally distributed.
	Management of Non-Detects	When data contain less than 15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantitation limit (PQL) as reported by the laboratory. When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
	Confidence Intervals	Used in Assessment and Corrective Action monitoring.
	No Statistical Testing	Statistical testing is not required for parameters containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
	Verification Resample Plan	Optional 1-of-2 with minimum of 8 samples per well for interwell and intrawell testing.
	Optional	▪ Interwell statistical methods may be used as a second step to determine if an apparent statistically significant increase (SSI) identified by intrawell statistical methods is below sitewide background. ▪ Initial statistical exceedance warrants independent resampling within 90 days. ▪ If resample passes, well/parameter is not a confirmed SSI. ▪ If resample exceeds, well/parameter has a confirmed SSI. ▪ If no resample is collected, the original result is deemed verified.

MEMORANDUM

Date: April 23, 2026

To: Kevin Stephenson and Kristen Jurinko – Southern Company

CC: Ben Hodges – Georgia Power Company

From: EnSafe Inc

Subject: Plant Bowen Landfill - Well Maintenance and Repair Documentation
Georgia Power Company

EnSafe has prepared this memorandum to provide documentation of groundwater monitoring well maintenance and/or repair performed at PLANT BOWEN during the annual reporting period. All repairs and maintenance were completed in accordance with the Georgia Environmental Protection Division (GAEPD) guidance on routine visual inspections of groundwater monitoring wells.

Georgia Power Site/Unit	Date Performed	Well ID	Maintenance/ Repair Performed
Plant Bowen Landfill	4/7/2026	GWC-34 / GWC-34R	Drainage improvements to reduce stormwater pooling around well pads and the surrounding area.

All maintenance and repairs are also documented in the 2026 annual/semiannual groundwater monitoring report.

APPENDIX B
MEMORANDA ON HYDROGEOLOGIC MONITORING PROGRAM

US EPA CCR Rule and GA EPD Rules of Solid Waste Management 391-3-4-.10

Hydrogeological Monitoring Program
December 7, 2025, through June 6, 2026

Prepared for:

Georgia Power Company

August 31, 2026

Prepared by:

Megon Stepaniuk

Stantec Consulting Services Inc.

The conclusions in the Report titled US EPA CCR Rule and the Georgia Environmental Protection Division (GA EPD) Rules of Solid Waste Management 391-3-4-.10 are Stantec's professional opinion, as of the time of the Report, and concerning the scope described in the Report. The opinions in the document are based on conditions and information existing at the time the scope of work was conducted and do not take into account any subsequent changes. The Report relates solely to the specific project for which Stantec was retained and the stated purpose for which the Report was prepared. The Report is not to be used or relied on for any variation or extension of the project or for any other project or purpose, and any unauthorized use or reliance is at the recipient's own risk.

Stantec has assumed all information received from Georgia Power Company (the "Client") and third parties in the preparation of the Report to be correct. While Stantec has exercised a customary level of judgment or due diligence in the use of such information, Stantec assumes no responsibility for the consequences of any error or omission contained therein.

This Report is intended solely for use by the Client in accordance with Stantec's contract with the Client. While the Report may be provided by the Client to applicable authorities having jurisdiction and to other third parties in connection with the project, Stantec disclaims any legal duty based upon warranty, reliance or any other theory to any third party, and will not be liable to such third party for any damages or losses of any kind that may result.

Figure 4A – 4B Plant Bowen Landfill – Cells 9 & 10 Well Network Hydrographs for December 7, 2025 to June 6, 2026

1 Background

Stantec Consulting Services Inc. (Stantec) was retained by Southern Company Services, Inc. (SCS) to assist with the hydrogeological (water level) monitoring program at Georgia Power Company's Plant Bowen (Site) Landfill Cells 1–10. The work is being conducted to comply with the United States Environmental Protection Agency (US EPA) coal combustion residuals (CCR) rule Title 40 Code of Federal Regulations (40 CFR) 257 Subpart D (CCR Rule) and the Georgia Environmental Protection Division (GA EPD) Rules of Solid Waste Management 391-3-4-.10 to assist with early detection of subsurface changes that might indicate land subsidence or sinkhole formation. Groundwater level fluctuations are monitored in accordance with the 2022 CCR Permit Groundwater Monitoring Plan.

The Site utilizes In-Situ® Inc telemetry and reporting software and pressure transducers to collect and record groundwater elevations from monitoring wells located around the perimeter of the landfill cells. The program was initiated in 2014 at Cells 1 & 2 and expanded in 2015, 2016, and 2023 to Cells 3 & 4, Cells 9 & 10, and Cells 5–8, respectively. During this reporting period from December 7, 2025, through June 6, 2026, transducers were deployed in overburden and bedrock wells as follows:

Cells 1 & 2:

- Three overburden wells (GWC-7Z, GWC-11, and GWC-13)
- Seven bedrock wells (GWA-2R, GWA-4R, GWC-6RZ, GWC-10R, GWC-11R, GWC-13R, and GWC-15R)

Cells 3 & 4:

- Two overburden wells (GWC-18 and GWC-36A)
- Six bedrock wells (GWC-16R, GWC-19R, GWC-22R, GWC-24R, GWC-25R, and GWC-36RA)

Cells 5 & 6 and 7 & 8:

- Four overburden wells (GWC-27, GWC-29, GWC-33, and GWC-34)
- Five bedrock wells (GWC-27R, GWC-29R, GWC-31R, GWC-33R, and GWC-34R)

Cells 9 & 10:

- Four overburden wells (GWA-39Z, GWA-43, GWC-47, and GWC-48)
- Six bedrock wells (GWA-39RZ, GWA-41R, GWA-43R, GWC-45R, GWC-47R, and GWC-49R)

Water level data are electronically logged hourly by each transducer. During this reporting period, logged data were uploaded after each reading via an In-Situ VuLink® telemetry system to an In-Situ® database website (HydroVu®) where the telemetry data are stored and compiled.

In addition to collecting transducer data, Etowah River levels data for the reporting period were obtained from an on-site transducer logging river data at a location near the river intake pumping structure, Northing: 1504757.08, Easting: 2068108.55 North American Datum (NAD) 1983. Etowah River levels and daily total precipitation data were obtained from a U.S. Geological Survey station gauge (02394670) near Cartersville, Georgia.

2 Maintenance Observations

SCS Civil Field Services (SCS-CFS) staff perform routine maintenance on transducers within the hydrogeologic monitoring program including battery change outs, transducer replacement, or reconnection of modem or transducer cables. The monitoring network has been reviewed and optimized to provide widespread spatial coverage to mitigate localized disruptions in the transducer network and prevent loss of monitoring in case of a potential sinkhole formation. During the reporting period, SCS-CFS conducted maintenance on the following locations: GWC-11R, GWC-16R, GWA-33, and GWA-39Z (Table 1). Although these transducers were not fully operational at these locations during the monitoring period, transducers located in nearby wells do not indicate subsurface changes. The following summarizes the maintenance performed at these locations.

GWC-11R

- Connection with the transducer was lost on March 26, 2026. Connection with the transducer resumed on March 28, 2026.
- Connection with the transducer was lost on April 12, 2026. Connection with the transducer resumed on April 13, 2026.

GWC-16R

- Connection with the transducer was lost on December 16, 2026. Connection with the transducer resumed on December 18, 2025, but connection remained sporadic through March 1, 2026.SCS replaced the transducer cable on February 18, 2026.
- Sporadic connections with the transducer begin on April 28, 2026. The battery was replaced on May 13, 2026, with sporadic connections with the transducer continuing until May 20, 2026, when normal readings from the instrument resumed.
- Sporadic connections with the transducer begin on May 27, 2026. Connection with the transducer resumed June 8, 2026.

GWA-33

- Connection with the transducer was lost on February 13, 2026. Connection with the transducer resumed on February 18, 2026, when SCS replaced the transducer within the well.

GWA-39Z

- Connection with the transducer was sporadic beginning March 10, 2026, with a loss of connection on March 11, 2026. Connection with the transducer resumed on March 17, 2026.
- Connection with the transducer was lost on April 14, 2026, with connection to the transducer restored on April 17, 2026.

3 Water Level Fluctuations

Continuous groundwater level data and river stage elevations for the Etowah River were recorded from December 7, 2025, through June 6, 2026. Reporting period hydrographs for Cells 1–10 are shown in Figures 1A through 4B.

Table 1 documents maintenance completed during the reporting period that had the potential to result in water level trend anomalies. During the reporting period, manual groundwater elevation gauging and groundwater sample collection took place from February 12 through March 3, 2026, as well as during an additional verification groundwater sampling event that occurred on May 13, 2026.

These field efforts are considered known disruptions to the water table and are marked on the hydrograph plots (**Figure 1A** through **Figure 4B**). Large volume groundwater purging induced water level decreases shown on hydrograph plots, marked by sampling events. Routine transducer maintenance activities and repairs occurred throughout the monitoring period and consisted of resetting reference water elevation depths, controlling insect infestation in wells, and replacing instrument batteries. Periodic sampling and maintenance may induce drifts in pressure readings. When drifts are noted, the reference depth to water is re-set, and the logging cycle is re-started.

The water levels in monitoring wells equipped with transducers exhibited similar overall trends during the reporting period. Groundwater elevations showed a gradual decrease through late December and early January, followed by a general increase beginning mid-January and continuing through the rest of the monitoring period. Water levels responded to precipitation events in mid-December, mid-January to early February, early and mid-March, and late May to early June. Following these changes, groundwater elevations returned to baseline trends. .

There were four rain events at the Site that resulted in precipitation exceeding 1.5-inches over a 24-hour period according to the U.S. Geological Survey station gauge (02394670) near Cartersville, Georgia. The first was 2.62” between January 9–10, 2026. The second was 2.23” between February 26–27, 2026. The third was 1.69” between May 6–7, 2026. The fourth was 3.29” between May 24–25, 2026. Consequent groundwater responses at the Site were captured with transducer data, and water level increases observed were approximately 2-feet during the rain event in early January, approximately 1.5 feet during the rain event in late February, and approximately 1.5 feet overall during the rain events in May. Water levels tapered off after a day or two and returned to normal levels within 7 days.

Overall trends were similar between the river and the wells, but the wells had a muted response compared to the river. There was a longer recovery period for the groundwater responses indicating that there was not an open, unimpeded connection between groundwater and surface water. Both the river stage and the groundwater appeared to be affected by some precipitation events. The observed variations in groundwater elevations were attributed to rainfall variations or to sampling or maintenance activities at the monitoring points. A comparison of river stage and precipitation data with recorded groundwater elevations (Figures 1A through 4B) showed that both sets of data follow similar overall patterns.

4 Conclusions and Recommendations

Observed disruptions in the transducer water levels were found to be directly attributed to (a) drawdown during sampling events and water level gauging, (b) maintenance of wells, transducers, or telemetry units; or (c) precipitation events. December 7, 2025, through June 6, 2026, hydrologic monitoring data did not show water level fluctuations attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation. To support continued hydrogeologic monitoring, Stantec recommends installing transducers in three newly constructed monitoring wells (GWC-25, GWC-31S, and GWC-58) at Plant Bowen.

With every community, we redefine what's possible.

Stantec is a global leader in sustainable engineering, architecture, and environmental consulting. The diverse perspectives of our partners and interested parties drive us to think beyond what's previously been done on critical issues like climate change, digital transformation, and future-proofing our cities and infrastructure. We innovate at the intersection of community, creativity, and client relationships to advance communities everywhere, so that together we can redefine what's possible.

RE: Project: Bowen LF Cells 3&4
Pace Project No.: 92844150

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory between February 13, 2026 and February 20, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang

QUALIFIERS

Project: Bowen LF Cells 3&4
Pace Project No.: 92844150

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92844150

[1]	STANTEC
[2]	DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

ANALYTE QUALIFIERS

1g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The LCS percent recovery was not biased into control and will be reported.
2g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The concentration of the analyte was not detected in the method blank.
CU	The continuing calibration for this analyte is above laboratory acceptance limits. Analyte was not detected above the reporting limit in any of the associated samples.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: Bowen LF Cells 9&10
Pace Project No.: 92844564

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory between February 17, 2026 and February 20, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang

QUALIFIERS

Project: Bowen LF Cells 9&10
Pace Project No.: 92844564

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92844564

[1]	STANTEC
[2]	DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

ANALYTE QUALIFIERS

1g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The LCS percent recovery was not biased into control and will be reported.
2g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The concentration of the analyte was not detected in the method blank.
CU	The continuing calibration for this analyte is above laboratory acceptance limits. Analyte was not detected above the reporting limit in any of the associated samples.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

	DC#_Title: ENV-FRM-HUN1-0083 v05_Sample Condition Upon Receipt
Pace	Effective Date: 05/24/2024

Laboratory receiving samples:

Asheville ☐ Eden ☐ Greenwood ☐ Huntersville ☐ Raleigh ☐ Mechanicsville ☐ Atlanta ☑ Kernersville ☐

Sample Condition Upon Receipt

Client Name: GA Power

Project #: **WO# : 92844564**

92844564

Courier: ☐ Commercial ☑ Fed Ex ☐ UPS ☐ USPS ☐ Client ☑ Pace ☐ Other:____

Custody Seal Present? ☐ Yes ☑ No Seals Intact? ☐ Yes ☐ No ☑ N/A

Date/Initials Person Examining Contents: 2/17/26 CAH

Packing Material: ☐ Bubble Wrap ☐ Bubble Bags ☑ None ☐ Other

Biological Tissue Frozen? ☐ Yes ☐ No ☑ N/A

Thermometer: ☐ IR Gun ID: 083

Type of Ice: ☑ Wet ☐ Blue ☐ None

Cooler Temp: 3.2 Correction Factor: Add/Subtract (°C) 0.0

Temp should be above freezing to 6°C

☐ Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 3.2

USDA Regulated Soil (☐ N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? ☐ Yes ☐ No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? ☐ Yes ☐ No

				Comments/Discrepancy:
Chain of Custody Present?	☑ Yes	☐ No	☐ N/A	1.
Samples Arrived within Hold Time?	☑ Yes	☐ No	☐ N/A	2.
Short Hold Time Analysis (<72 hr.)?	☐ Yes	☑ No	☐ N/A	3.
Rush Turn Around Time Requested?	☐ Yes	☑ No	☐ N/A	4.
Sufficient Volume?	☑ Yes	☐ No	☐ N/A	5.
Correct Containers Used?	☑ Yes	☐ No	☐ N/A	6.
-Pace Containers Used?	☑ Yes	☐ No	☐ N/A	
Containers Intact?	☑ Yes	☐ No	☐ N/A	7.
Dissolved analysis: Samples Field Filtered?	☐ Yes	☐ No	☑ N/A	8.
Sample Labels Match COC?	☑ Yes	☐ No	☐ N/A	9.
-Includes Date/Time/ID/Analysis Matrix: W				
Headspace in VOA Vials (>5-6mm)?	☐ Yes	☐ No	☑ N/A	10.
Trip Blank Present?	☐ Yes	☐ No	☑ N/A	11.
Trip Blank Custody Seals Present?	☐ Yes	☐ No	☑ N/A	

COMMENTS/SAMPLE DISCREPANCY

Field Data Required? ☐ Yes ☐ No

Lot ID of split containers:

CLIENT NOTIFICATION/RESOLUTION

Person contacted: _____ Date/Time: _____

Project Manager SCURF Review: _____ Date: _____

Project Manager SRF Review: _____ Date: _____

*Check mark top half of box if pH and/or dechlorination is verified and within the acceptance range for preservation samples.
Exceptions: VOA, Coliform, TOC, Oil and Grease, DRO/8015 (water) DOC, LLHg
**Bottom half of box is to list number of bottles
***Check all unpreserved Nitrates for chlorine

RE: Project: Bowen LF Cells 1&2
Pace Project No.: 92845506

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory between February 20, 2026 and February 25, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang

QUALIFIERS

Project: Bowen LF Cells 1&2
Pace Project No.: 92845506

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92845506

[1]	STANTEC
[2]	DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

ANALYTE QUALIFIERS

1g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The LCS percent recovery was not biased into control and will be reported.
2g	The continuing calibration verification (CCV) for this analyte was above laboratory acceptance limits. The concentration of the analyte was not detected in the method blank.
B	Analyte was detected in the associated method blank.
CU	The continuing calibration for this analyte is above laboratory acceptance limits. Analyte was not detected above the reporting limit in any of the associated samples.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Pace	DC#_Title: ENV-FRM-HUN1-0083 v05_Sample Condition Upon Receipt
	Effective Date: 05/24/2024

Laboratory receiving samples:

Asheville ☐ Eden ☐ Greenwood ☐ Huntersville ☐ Raleigh ☐ Mechanicsville ☐ Atlanta ☑ Kernersville ☐

Sample Condition Upon Receipt

Client Name: GA Power

Project #

WO# : 92845506

92845506

Courier: ☐ Commercial ☐ Fed Ex ☐ Pace ☐ UPS ☐ USPS ☐ Other:____ ☑ Client

Custody Seal Present? ☐ Yes ☑ No **Seals Intact?** ☐ Yes ☐ No ☑ N/A

Date/Initials Person Examining Contents: 2/20/26 GH

Packing Material: ☐ Bubble Wrap ☐ Bubble Bags ☑ None ☐ Other

Biological Tissue Frozen? ☐ Yes ☐ No ☑ N/A

Thermometer: ☑ IR Gun ID: 214

Type of Ice: ☑ Wet ☐ Blue ☐ None

Cooler Temp: 3.3 **Correction Factor:** Add/Subtract (°C) 0.0

Temp should be above freezing to 6°C

☐ Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 3.3

USDA Regulated Soil (☐ N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? ☐ Yes ☐ No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? ☐ Yes ☐ No

				Comments/Discrepancy:
Chain of Custody Present?	☑ Yes	☐ No	☐ N/A	1.
Samples Arrived within Hold Time?	☑ Yes	☐ No	☐ N/A	2.
Short Hold Time Analysis (<72 hr.)?	☐ Yes	☑ No	☐ N/A	3.
Rush Turn Around Time Requested?	☐ Yes	☑ No	☐ N/A	4.
Sufficient Volume?	☑ Yes	☐ No	☐ N/A	5.
Correct Containers Used?	☑ Yes	☐ No	☐ N/A	6.
-Pace Containers Used?	☑ Yes	☐ No	☐ N/A	
Containers Intact?	☑ Yes	☐ No	☐ N/A	7.
Dissolved analysis: Samples Field Filtered?	☐ Yes	☐ No	☑ N/A	8.
Sample Labels Match COC?	☑ Yes	☐ No	☐ N/A	9.
-Includes Date/Time/ID/Analysis Matrix: W				
Headspace in VOA Vials (>5-6mm)?	☐ Yes	☐ No	☑ N/A	10.
Trip Blank Present?	☐ Yes	☐ No	☑ N/A	11.
Trip Blank Custody Seals Present?	☐ Yes	☐ No	☑ N/A	

COMMENTS/SAMPLE DISCREPANCY

Field Data Required? ☐ Yes ☐ No

Lot ID of split containers:

CLIENT NOTIFICATION/RESOLUTION

Person contacted: _____ Date/Time: _____

Project Manager SCURF Review: _____ **Date:** _____

Project Manager SRF Review: _____ **Date:** _____

*Check mark top half of box if pH and/or dechlorination is verified and within the acceptance range for preservation samples.
Exceptions: VOA, Coliform, TOC, Oil and Grease, DRO/8015 (water) DOC, LLHg
**Bottom half of box is to list number of bottles
***Check all unpreserved Nitrates for chlorine

Pace	DC#_Title: ENV-FRM-HUN1-0083 v05_Sample Condition Upon Receipt
	Effective Date: 05/24/2024

Laboratory receiving samples:

Asheville ☐ Eden ☐ Greenwood ☐ Huntersville ☐ Raleigh ☐ Mechanicsville ☐ Atlanta ☑ Kernersville ☐

Sample Condition Upon Receipt

Client Name: CA Power

Project #:

Courier: ☐ Commercial ☐ Fed Ex ☑ Pace ☐ UPS ☐ USPS ☐ Other:____ ☐ Client

Custody Seal Present? ☐ Yes ☑ No Seals Intact? ☐ Yes ☐ No ☑ N/A

Date/Initials Person Examining Contents: 2/20/26 CH

Packing Material: ☐ Bubble Wrap ☐ Bubble Bags ☑ None ☐ Other

Biological Tissue Frozen? ☐ Yes ☐ No ☑ N/A

Thermometer: ☑ IR Gun ID: 214

Type of Ice: ☑ Wet ☐ Blue ☐ None

Cooler Temp: 3.3 Correction Factor: Add/Subtract (°C) 0.0

Temp should be above freezing to 6°C

☐ Samples out of temp criteria. Samples on ice, cooling process has begun

Cooler Temp Corrected (°C): 3.3

USDA Regulated Soil (☐ N/A, water sample)

Did samples originate in a quarantine zone within the United States: CA, NY, or SC (check maps)? ☐ Yes ☐ No

Did samples originate from a foreign source (internationally, including Hawaii and Puerto Rico)? ☐ Yes ☐ No

				Comments/Discrepancy:
Chain of Custody Present?	☑ Yes	☐ No	☐ N/A	1.
Samples Arrived within Hold Time?	☑ Yes	☐ No	☐ N/A	2.
Short Hold Time Analysis (<72 hr.)?	☐ Yes	☑ No	☐ N/A	3.
Rush Turn Around Time Requested?	☐ Yes	☑ No	☐ N/A	4.
Sufficient Volume?	☑ Yes	☐ No	☐ N/A	5.
Correct Containers Used?	☑ Yes	☐ No	☐ N/A	6.
-Pace Containers Used?	☑ Yes	☐ No	☐ N/A	
Containers Intact?	☑ Yes	☐ No	☐ N/A	7.
Dissolved analysis: Samples Field Filtered?	☐ Yes	☐ No	☑ N/A	8.
Sample Labels Match COC?	☑ Yes	☐ No	☐ N/A	9.
-Includes Date/Time/ID/Analysis Matrix:	W			
Headspace in VOA Vials (>5-6mm)?	☐ Yes	☐ No	☑ N/A	10.
Trip Blank Present?	☐ Yes	☐ No	☑ N/A	11.
Trip Blank Custody Seals Present?	☐ Yes	☐ No	☑ N/A	

COMMENTS/SAMPLE DISCREPANCY

Field Data Required? ☐ Yes ☐ No

RE: Project: Bowen LF Cells 5-8
Pace Project No.: 92845986

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory between February 25, 2026 and March 04, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang

QUALIFIERS

Project: Bowen LF Cells 5-8
Pace Project No.: 92845986

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92845986

[1] STANTEC

[2] DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: Bowen LF Cells 1&2-Resample
Pace Project No.: 92860109

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory on May 13, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang
bonnie.vang@pacelabs.com

QUALIFIERS

Project: Bowen LF Cells 1&2-Resample
Pace Project No.: 92860109

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92860109

[1] STANTEC

[2] DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

RE: Project: Bowen LF Cells 9&10-Resample
Pace Project No.: 92860117

Dear Kristen Jurinko:

Enclosed are the analytical results for sample(s) received by the laboratory on May 13, 2026. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - West Columbia

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Bonnie Vang

QUALIFIERS

Project: Bowen LF Cells 9&10-Resample
Pace Project No.: 92860117

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 92860117

[1] STANTEC

[2] DO NOT DILUTE. MUST MEET REPORTING LIMITS. LET PM KNOW FIRST IF THERE ARE ISSUES.

ANALYTE QUALIFIERS

1g The sample was analyzed in a bracket that contained 11 injections, which is more than the limit of 10 injections per bracket. Because bracketing QC is passing, the data is reported.

DATA USABILITY SUMMARY

Stantec reviewed two data packages from Pace Analytical for the analysis of water samples collected from February 17 thru 24, and a resampling event May 13, 2026, at the Georgia Power Bowen Plant site (Cells 1 & 2). Samples were collected according to the 2022 CCR Permit Groundwater Monitoring Plan (CCR Permit No. 008-018D [CCR]).

Intended Use of Data: To delineate concentrations of constituents of concern in site groundwater.

Analyses requested included:

- SW-846-6020B – Metals by inductively coupled plasma - mass spectrometry (ICP/MS)
- SW-846 7470A – Mercury by manual cold-vapor
- EPA 300 Rev 2.1 – Chloride, fluoride, and sulfate by ion chromatography
- SM 2320B – 2011 - Alkalinity
- SM 2540C - 2015 – Total dissolved solids (TDS)

Data were reviewed and validated as described in the field sampling plan and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (November 2020). The results of the review/validation are discussed in this Data Usability Summary (DUS) and associated electronic data deliverable (EDD).

DATA REVIEW/VALIDATION RESULTS

Introduction

Twenty-four (24) groundwater samples, three (3) field blanks, three (3) equipment blanks, and three (3) field duplicate samples were analyzed for one or more of the analyses listed above. In addition, one (1) sample, field duplicate, field blank, and equipment blank were resampled and submitted for a subset of analyses listed above. Table 1 lists the field identifications cross-referenced to laboratory identifications. Table 2 is a summary of qualified data. Tables 3a – 3c summarize field duplicate results.

Analytical Results

The data packages contain a minimum of one quality control batch per analytical method analyzed. The quality control batch identifies the laboratory QC samples that correspond to the designated field samples. Not detected results are reported as less than the value of the method detection limit (MDL).

Preservation and Holding Times

The samples were evaluated for agreement with the chain-of-custody forms. The samples were received in the appropriate containers with the paperwork filled out properly. The laboratory sample condition upon receipt forms indicates all samples were received at temperatures of 3.3°C and 3.6°C. The resampling event cooler temperature was noted received at 13.6°C however the cooler was received at the laboratory approximately 2 hours after collection and therefore did not have time to cool to temperature yet; no qualification was necessary. All samples were analyzed within the technical holding time. No data were qualified.

Calibrations

Case narratives indicate Initial and continuing calibration verification data were within method

acceptance criteria with the following exception.

- The continuing calibration verification (CCV) for beryllium in batch 993263 was above laboratory acceptance limits. The concentration of beryllium was not detected in the associated samples and since the bias was high, no qualification was necessary.

Blanks

Laboratory Method Blanks. No contamination was detected in any of the laboratory method blanks with the following exception.

- Vanadium was detected in method blank 5106182 at a concentration below the reporting limit. Associated detected samples results with concentrations less than 10 times the blank have been qualified as estimated with a high bias (J+).

Field Blanks. Field blanks (BOW-LF1-2-FB-09, BOW-LF1-2-EB-09, BOW-LF1-2-FB-10, BOW-LF1-2-EB-10, BOW-LF1-2-FB-11, BOW-LF1-2-EB-11, BOW-LF1-2-FB-01, and BOW-LF1-2-EB-01) were analyzed for the full suite of sample analyses and all analytes were reported as not detected with the following exception.

- Zinc was detected in BOW-LF1-2 EB-10 at a concentration below the reporting limit. Associated detected samples results with concentrations less than 10 times the blank have been qualified as estimated with a high bias (J+).

Laboratory Control Samples

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) recoveries met the laboratory acceptance criteria for all analyses with the following exception.

- The CCV for beryllium in batch 993263 was above laboratory acceptance limits. The LCS recovery of beryllium was within acceptance limits and therefore no qualification was necessary.

Matrix Spike/Matrix Spike Duplicates

Site-specific MS/MSD precision and accuracy results were within the laboratory acceptance criteria with the following exceptions:

- Calcium and magnesium in sample BOW-GWA-1, calcium in sample BOW-GWC-8RR, and magnesium in sample BOW-GWC-14Z had MS percent recoveries outside of laboratory acceptance criteria. However, the spiking concentrations were less than 30% of the concentration reported for the parent sample and therefore not appropriate for evaluation.

Laboratory Duplicates

Appropriate analytical duplicates were analyzed and RPDs were within the laboratory acceptance criteria.

Analyte Quantitation and Sensitivity

All results were reported to the MDLs in mg/L.

Positive results that were less than the reporting limit (RL), but greater than the MDL were qualified “J,”

as estimated concentrations by the laboratory, due to increased uncertainty near the detection limit. These qualified results were retained in this assessment. Sample results reported between the MDL and RL are usable as estimated values with an unknown directional bias.

All RLs were less than five times (<5X) the reported MDLs with the following exceptions:

- Boron (6.45X)

Metals (6020): Several samples required dilution to bring the target calcium concentrations into the calibration range. Elevated MDLs and RLs were reported as required.

Field Precision

Four sets of field duplicate samples were collected for this sampling event (see Tables 3a, 3b, 3c, and 3d for sample/duplicate identification and precision calculations). The calculated RPDs between sample and duplicate were within the QAPP acceptance criteria of 25% for all analytes detected above five times the RL. For results reported less than five times the RL, with a difference between sample and duplicate less than two times the RL are also considered acceptable (qualified "A*"). All field duplicate precision was considered acceptable with the following exception.

- TDS in the field duplicate pair BOW-GWA-3A / BOW-LF1-2-FD-09 had a high RPD and both the parent and duplicate have been qualified as estimated (J).

Summary

The groundwater analytical data are usable for the purpose of determining current concentrations of COCs in this medium at the affected property. A summary of qualified data is presented in Table 2 below.

Table 2 – Qualified Analytical Data

Field Identification	Analyte	Qualification	Reason for Qualification
BOW-GWC-13	Vanadium	J+ / BLL	Detected in MB
BOW-GWC-8RR	Vanadium	J+ / BLL	Detected in MB
BOW-GWC-10	Zinc	J+ / BFL	Detected in FB
BOW-GWC-13	Zinc	J+ / BFL	Detected in FB
BOW-GWA-3A	TDS	J / FD1	High FD RPD
BOW-LF1-2-FD-09	TDS	J / FD1	High FD RPD

BFL – Blank Field Low – detected in field blank below the reporting limit.
BLL – Blank Lab Low – detected in laboratory method blank below the reporting limit.
FD1 – High field duplicate RPD
J – Estimated data
J+ – Estimated data with a high bias; the reported quantitation limit or sample concentration is approximated due to exceedance of one or more QC requirements.

Table 3a – Field Precision

Field Identification	Analyte	Sample Result (mg/L)	Duplicate Result (mg/L)	RPD[a]	Qualified
BOW-GWA-3A / BOW-LF1-2-FD-09	Chloride	10.5	10.6	0.9%	A

DATA USABILITY SUMMARY

Stantec reviewed one data package from Pace Analytical for the analysis of water samples collected from February 12 through 17, 2026, at the Georgia Power Bowen Plant site (Cells 3 & 4). Samples were collected according to the 2022 CCR Permit Groundwater Monitoring Plan (CCR Permit No. 008-018D [CCR]).

Intended Use of Data: To delineate concentrations of constituents of concern in site groundwater.

Analyses requested included:

- SW-846-6020B – Metals by inductively coupled plasma - mass spectrometry (ICP/MS)
- SW-846 7470A – Mercury by manual cold-vapor
- EPA 300 Rev 2.1 – Chloride, fluoride, and sulfate by ion chromatography
- SM 2320B – 2011 - Alkalinity
- SM 2540C - 2015 – Total dissolved solids (TDS)

Data were reviewed and validated as described in the field sampling plan and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (November 2020). The results of the review/validation are discussed in this Data Usability Summary (DUS) and associated electronic data deliverable (EDD).

DATA REVIEW/VALIDATION RESULTS

Introduction

Sixteen (16) groundwater samples, two (2) field blanks, two (2) equipment blanks, and two (2) field duplicate samples were analyzed for one or more of the analyses listed above. Table 1 lists the field identifications cross-referenced to laboratory identifications. Table 2 is a summary of qualified data. Tables 3a – 3b summarize field duplicate results.

Analytical Results

The data packages contain a minimum of one quality control batch per analytical method analyzed. The quality control batch identifies the laboratory QC samples that correspond to the designated field samples. Not detected results are reported as less than the value of the method detection limit (MDL).

Preservation and Holding Times

The samples were evaluated for agreement with the chain-of-custody forms. The samples were received in the appropriate containers with the paperwork filled out properly. The laboratory sample condition upon receipt forms indicates all samples were received at temperature range of 3.2°C to 4.8°C. All samples were analyzed within the technical holding time. No data were qualified.

Calibrations

Case narratives indicate Initial and continuing calibration verification data were within method acceptance criteria with the following exception.

- The continuing calibration verification (CCV) for beryllium in batch 991018 was above laboratory acceptance limits (lab qualifier “2g”). The concentration of beryllium was not detected in the associated samples and since the bias was high, no additional qualification was necessary.

Blanks

Laboratory Method Blanks. No contamination was detected in any of the laboratory method blanks with the following exceptions:

- Chromium and manganese were detected in the method blank 4910956 at a concentration (0.0016J, 0.0017J) below the reporting limit. Associated sample results were reported as not detected and since the bias is high, no qualification was necessary.
- Mercury was detected in the method blank 4909892 at a concentration (0.00017J) below the reporting limit. Associated sample results were reported as not detected and since the bias is high, no qualification was necessary.

Field Blanks. Field blanks (BOW-LF3-4-FB-05, BOW-LF3-4-EB-05, BOW-LF3-4-FB-06, and BOW-LF3-4-EB-06) were analyzed for the full suite of sample analyses and all analytes were not detected with the following exceptions.

- Chromium, Zinc, and mercury were detected in the blank BOW-LF3-4-EB-06 at concentrations below the reporting limit. Associated sample results for mercury were reported as not detected and since the bias is high, no qualification was necessary. Associated chromium and zinc results reported with concentrations less than 10 times the blank concentration have been qualified as estimated with a high bias (J+).

Laboratory Control Samples

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) recoveries met the laboratory acceptance criteria for all analyses with the following exception.

- The CCV for beryllium in batch 991018 was above laboratory acceptance limits (lab qualifier "1g"). The LCS recovery of beryllium was within acceptance limits and therefore no qualification was necessary.

Matrix Spike/Matrix Spike Duplicates

Site-specific MS/MSD precision and accuracy results were within the laboratory acceptance criteria.

Laboratory Duplicates

Appropriate analytical duplicates were analyzed and RPDs were within the laboratory acceptance criteria.

Analyte Quantitation and Sensitivity

All results were reported to the MDLs in mg/L.

Positive results that were less than the reporting limit (RL), but greater than the MDL were qualified "J," as estimated concentrations by the laboratory, due to increased uncertainty near the detection limit. These qualified results were retained in this assessment. Sample results reported between the MDL and RL are usable as estimated values with an unknown directional bias.

All RLs were less than five times (<5X) the reported MDLs with the following exceptions:

- Boron (6.45X)

Metals (6020): Several samples required dilution to bring the target calcium and/or magnesium concentrations into the calibration range. Elevated MDLs and RLs were reported as required.

Field Precision

Two sets of field duplicate samples were collected for this sampling event (see Tables 3a and 3b for sample/duplicate identification and precision calculations). The calculated RPDs between sample and duplicate were within the QAPP acceptance criteria of 25% for all analytes detected above five times the RL. For results reported less than five times the RL, with a difference between sample and duplicate less than two times the RL are also considered acceptable (qualified "A*"). All field duplicate precision was considered acceptable.

Summary

The groundwater analytical data are usable for the purpose of determining current concentrations of COCs in this medium at the affected property. A summary of qualified data is presented in Table 2 below.

DATA USABILITY SUMMARY

Stantec reviewed one data package from Pace Analytical for the analysis of water samples collected from February 24 through March 2, 2026, at the Georgia Power Bowen Plant site (Cells 5 & 8). Samples were collected according to the 2022 CCR Permit Groundwater Monitoring Plan (CCR Permit No. 008-018D [CCR]).

Intended Use of Data: To delineate concentrations of constituents of concern in site groundwater.

Analyses requested included:

- SW-846-6020B – Metals by inductively coupled plasma - mass spectrometry (ICP/MS)
- SW-846 7470A – Mercury by manual cold-vapor
- EPA 300 Rev 2.1 – Chloride, fluoride, and sulfate by ion chromatography
- SM 2320B – 2011 - Alkalinity
- SM 2540C - 2015 – Total dissolved solids (TDS)

Data were reviewed and validated as described in the field sampling plan and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (November 2020). The results of the review/validation are discussed in this Data Usability Summary (DUS) and associated electronic data deliverable (EDD).

DATA REVIEW/VALIDATION RESULTS

Introduction

Seventeen (17) groundwater samples, two (2) equipment blanks, two (2) field blanks, and two (2) field duplicate samples were analyzed for one or more of the analyses listed above. Table 1 lists the field identifications cross-referenced to laboratory identifications. Table 2 is a summary of qualified data. Tables 3a – 3b summarize field duplicate results.

Analytical Results

The data packages contain a minimum of one quality control batch per analytical method analyzed. The quality control batch identifies the laboratory QC samples that correspond to the designated field samples. Not detected results are reported as less than the value of the method detection limit (MDL).

Preservation and Holding Times

The samples were evaluated for agreement with the chain-of-custody forms. The samples were received in the appropriate containers with the paperwork filled out properly. The laboratory sample condition upon receipt forms indicates all samples were received at temperatures ranging from 2.6°C to 5.0°C. All samples were analyzed within the technical holding time. No data were qualified.

Calibrations

Case narratives indicate Initial and continuing calibration verification data were within method acceptance criteria.

Blanks

Laboratory Method Blanks. No contamination was detected in any of the laboratory method blanks.

Field Blanks. Field blanks (BOW-LF5-8-EB-12, BOW-LF5-8-FB-12, BOW-LF5-8-EB-13, and BOW-LF5-8-FB-13) were analyzed for the full suite of sample analyses and all analytes were reported as not detected with the following exceptions:

- Chromium was detected in the blanks BOW-LF5-8-FB-13 and BOW-LF5-8-EB-13 at concentrations below the reporting limit. Sample results detected at concentrations greater the 10 times the blank do not require qualification. Associated detected samples results less than 10 times the blank concentration have been qualified as estimated with a high bias (J+).

Laboratory Control Samples

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) recoveries met the laboratory acceptance criteria for all analyses.

Matrix Spike/Matrix Spike Duplicates

Site-specific MS/MSD precision and accuracy results were within the laboratory acceptance criteria with the following exceptions:

- Calcium and magnesium in sample BOW-GWC-27 and BOW-GWC-31R had low MS/MSD percent recoveries. However, the spiking concentrations were less than 30% of the concentration reported for the parent sample and therefore not appropriate for evaluation.

Laboratory Duplicates

Appropriate analytical duplicates were analyzed and RPDs were within the laboratory acceptance criteria.

Analyte Quantitation and Sensitivity

All results were reported to the MDLs in mg/L.

Positive results that were less than the reporting limit (RL), but greater than the MDL were qualified "J," as estimated concentrations by the laboratory, due to increased uncertainty near the detection limit. These qualified results were retained in this assessment. Sample results reported between the MDL and RL are usable as estimated values with an unknown directional bias.

All RLs were less than five times (<5X) the reported MDLs with the following exceptions:

- Boron (6.45X)

Metals (6020): Several samples required dilution to bring the target calcium and/or magnesium concentrations into the calibration range. Elevated MDLs and RLs were reported as required.

Field Precision

Two sets of field duplicate samples were collected for this sampling event (see Tables 3a and 3b for sample/duplicate identification and precision calculations). The calculated RPDs between sample and duplicate were within the QAPP acceptance criteria of 25% for all analytes detected above five times the RL. For results reported less than five times the RL, with a difference between sample and duplicate less

than two times the RL are also considered acceptable (qualified "A*"). All field duplicate precision was considered acceptable with the exceptions noted in Table 2.

Summary

The groundwater analytical data are usable for the purpose of determining current concentrations of COCs in this medium at the affected property. A summary of qualified data is presented in Table 2 below.

DATA USABILITY SUMMARY

Stantec reviewed one data package from Pace Analytical for the analysis of water samples collected from February 16 and 17, 2026, at the Georgia Power Bowen Plant site (Cells 9 & 10). Samples were collected according to the 2022 CCR Permit Groundwater Monitoring Plan (CCR Permit No. 008-018D [CCR]).

Intended Use of Data: To delineate concentrations of constituents of concern in site groundwater.

Analyses requested included:

- SW-846-6020B – Metals by inductively coupled plasma - mass spectrometry (ICP/MS)
- SW-846 7470A – Mercury by manual cold-vapor
- EPA 300 Rev 2.1 – Chloride, fluoride, and sulfate by ion chromatography
- SM 2320B – 2011 - Alkalinity
- SM 2540C - 2015 – Total dissolved solids (TDS)

Data were reviewed and validated as described in the field sampling plan and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (November 2020). The results of the review/validation are discussed in this Data Usability Summary (DUS) and associated electronic data deliverable (EDD).

DATA REVIEW/VALIDATION RESULTS

Introduction

Seventeen (17) groundwater samples, two (2) equipment blanks, two (2) field blanks, and two (2) field duplicate samples were analyzed for one or more of the analyses listed above. Table 1 lists the field identifications cross-referenced to laboratory identifications. Table 2 is a summary of qualified data. Tables 3a – 3b summarize field duplicate results.

Analytical Results

The data packages contain a minimum of one quality control batch per analytical method analyzed. The quality control batch identifies the laboratory QC samples that correspond to the designated field samples. Not detected results are reported as less than the value of the method detection limit (MDL).

Preservation and Holding Times

The samples were evaluated for agreement with the chain-of-custody forms. The samples were received in the appropriate containers with the paperwork filled out properly. The laboratory sample condition upon receipt forms indicates all samples were received at a temperature of 3.1°C. All samples were analyzed within the technical holding time. No data were qualified.

Calibrations

Case narratives indicate Initial and continuing calibration verification data were within method acceptance criteria with the following exception.

- The continuing calibration verification (CCV) for beryllium in batch 993263 was above laboratory acceptance limits. The concentration of beryllium was not detected in the associated samples and since the bias was high, no qualification was necessary.

Blanks

Laboratory Method Blanks. No contamination was detected in any of the laboratory method blanks.

Field Blanks. Field and equipment blanks (BOW-LF9-10-EB-07, BOW-LF9-10-FB-07, BOW-LF9-10-EB-08, and BOW-LF9-10-FB-08) were analyzed for the full suite of sample analyses and all analytes were not detected with the following exceptions:

- Zinc was detected in BOW-LF9-10-EB-08 at concentrations below the reporting limit. Associated detected sample results with concentrations less than 10 times the blank have been qualified as estimated with a high bias (J+).

Laboratory Control Samples

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) recoveries met the laboratory acceptance criteria for all analyses with the following exception.

- The CCV for beryllium in batch 993263 was above laboratory acceptance limits. The LCS recovery of beryllium was within acceptance limits and therefore no qualification was necessary.

Matrix Spike/Matrix Spike Duplicates

Site-specific MS/MSD precision and accuracy results were within the laboratory acceptance criteria with the following exceptions.

- Calcium in sample BOW-GWC-49R had MS/MSD recoveries outside of laboratory acceptance limits. However, the spiking concentration was less than 30% of the sample concentration and therefore not appropriate for evaluation

Laboratory Duplicates

Appropriate analytical duplicates were analyzed and RPDs were within the laboratory acceptance criteria.

Analyte Quantitation and Sensitivity

All results were reported to the MDLs in mg/L.

Positive results that were less than the reporting limit (RL), but greater than the MDL were qualified "J," as estimated concentrations by the laboratory, due to increased uncertainty near the detection limit. These qualified results were retained in this assessment. Sample results reported between the MDL and RL are usable as estimated values with an unknown directional bias.

All RLs were less than five times (<5X) the reported MDLs with the following exceptions:

- Boron (6.45X)

Metals (6020): Several samples required dilution to bring the target calcium and/or manganese concentrations into the calibration range. Elevated MDLs and RLs were reported as required.

Field Precision

Two sets of field duplicate samples were collected for this sampling event (see Tables 3a and 3b for sample/duplicate identification and precision calculations). The calculated RPDs between sample and duplicate were within the QAPP acceptance criteria of 25% for all analytes detected above five times the RL. For results reported less than five times the RL, with a difference between sample and duplicate less than two times the RL are also considered acceptable (qualified "A*"). All field duplicate precision was considered acceptable.

Summary

The groundwater analytical data are usable for the purpose of determining current concentrations of COCs in this medium at the affected property. A summary of qualified data is presented in Table 2 below.

Table 2 – Qualified Analytical Data

Field Identification	Analyte	Qualification	Reason for Qualification
BOW-GWC-49Z	Zinc	J+ / BFL	Detected in EB
BOW-GWC-47R	Zinc	J+ / BFL	Detected in EB
BOW-GWC-48	Zinc	J+ / BFL	Detected in EB
BOW-GWC-45	Zinc	J+ / BFL	Detected in EB
BOW-GWC-45R	Zinc	J+ / BFL	Detected in EB

BFL – Blank Field Low – detected in field blank below the reporting limit.
J – Estimated data; the reported quantitation limit or sample concentration is approximated due to exceedance of one or more QC requirements.
J+ - estimated with a high bias

Table 3a – Field Precision

Field Identification	Analyte	Sample Result (mg/L)	Duplicate Result (mg/L)	RPD[a]	Qualified
BOW-GWC-46R / BOW-LF9-10-FD-07	TDS	206	215	4.3%	A
	Chloride	3.5	3.5	<5xRL, <2xRL	A*

Samples

Sample ID:	Description:
GWC-20R	Metals, Inorganics, Alkalinity, TDS

Created using VuSitu from In-Situ, Inc.

Low-Flow Test Report:

Test Date / Time: 2/12/2026 3:44:44 PM
Project: Plant Bowen LF February 2026
Operator Name: Natalie Piparo

Location Name: GWC-38 **Well Diameter: 2 in** **Casing Type: PVC** **Screen Length: 10 ft** **Top of Screen: 59.35 ft** **Total Depth: 69.35 ft** **Initial Depth to Water: 59.51 ft**	**Pump Type: QED Dedicated** **Tubing Type: LDPE** **Pump Intake From TOC: 64.35 ft** **Estimated Total Volume Pumped: 3750 ml** **Flow Cell Volume: 90 ml** **Final Flow Rate: 150 ml/min** **Final Draw Down: 1.08 ft**	**Instrument Used: Aqua TROLL 400** **Serial Number: 1197755**

Test Notes:
Prepurged 19 L
Depth to water started in screen interval. Three well volume method initiated.

Low-Flow Readings:

Date Time	Elapsed Time	pH	Temperature	Specific Conductivity	RDO Concentration	Turbidity	ORP	Depth to Water	Salinity	Flow
		+/- 0.1	+/- 1000 %	+/- 5 %	+/- 10 %	+/- 5	+/- 1000 %	+/- 0.3	+/- 1000 %	
2/12/2026 3:44 PM	00:00	4.334 pH	18.62 °C	28.18 µS/cm	7.753 mg/L	0.400 NTU	125.8 mV	60.51 ft	0.012 PSU	150.0 ml/min

Project: Plant Bowen LF February 2026
Operator Name: Natalie Piparo

Location Name: GWA-42 **Well Diameter: 2 in** **Casing Type: PVC** **Screen Length: 10 ft** **Top of Screen: 74.36 ft** **Total Depth: 84.36 ft** **Initial Depth to Water: 81.25 ft**	**Pump Type: QED Dedicated** **Tubing Type: LDPE** **Pump Intake From TOC: 79.36 ft** **Estimated Total Volume Pumped: 4500 ml** **Flow Cell Volume: 90 ml** **Final Flow Rate: 180 ml/min** **Final Draw Down: 0.05 ft**	**Instrument Used: Aqua TROLL 400** **Serial Number: 1197755**

Test Notes:
Prepurged 6 L
DTW began in screen interval, three well volume method initiated.

Low-Flow Readings:

Date Time	Elapsed Time	pH	Temperature	Specific Conductivity	RDO Concentration	Turbidity	ORP	Depth to Water	Salinity	Flow
		+/- 0.1	+/- 1000 %	+/- 5 %	+/- 10 %	+/- 5	+/- 1000 %	+/- 0.3	+/- 1000 %	
2/16/2026 10:12 AM	00:00	7.184 pH	16.06 °C	300.6 µS/cm	4.730 mg/L	0.350 NTU	140.4 mV	81.30 ft	0.144 PSU	180.0 ml/min

Samples

Sample ID:	Description:
GWA-43R	Metals, Inorganics, Alkalinity, TDS

Created using VuSitu from In-Situ, Inc.

Low-Flow Test Report:

Test Date / Time: 2/16/2026 12:41:01 PM
Project: Plant Bowen LF February 2026
Operator Name: Shannon Northen

Location Name: GWC-21R **Well Diameter: 2 in** **Casing Type: PVC** **Screen Length: 10 ft** **Top of Screen: 80.59 ft** **Total Depth: 90.59 ft** **Initial Depth to Water: 74.52 ft**	**Pump Type: QED Dedicated** **Tubing Type: LPDE** **Pump Intake From TOC: 85.59 ft** **Estimated Total Volume Pumped: 11100 ml** **Flow Cell Volume: 90 ml** **Final Flow Rate: 100 ml/min** **Final Draw Down: 5.63 ft**	**Instrument Used: Aqua TROLL 400** **Serial Number: 1202788**

Test Notes:
Pre-purged 3L.
Draw down did not stabilize. Depth to water entered the screen. Complete evacuation method initiated. Samples will be taken 2/17/26.

Low-Flow Readings:

Samples

Sample ID:	Description:
GWC-8RR	Metals, Inorganics, Alkalinity, TDS

Created using VuSitu from In-Situ, Inc.

Low-Flow Test Report:

Test Date / Time: 2/20/2026 9:44:23 AM
Project: Plant Bowen LF February 2026
Operator Name: Ori Kimhi

Location Name: GWC-13RZ **Well Diameter: 2 in** **Casing Type: PVC** **Screen Length: 10 ft** **Top of Screen: 94.3 ft** **Total Depth: 104.3 ft** **Initial Depth to Water: 94.51 ft**	**Pump Type: QED Dedicated** **Tubing Type: LDPE** **Pump Intake From TOC: 99.3 ft** **Estimated Total Volume Pumped: 200 ml** **Flow Cell Volume: 90 ml** **Final Flow Rate: 100 ml/min** **Final Draw Down: 0.19 ft**	**Instrument Used: Aqua TROLL 400** **Serial Number: 850735**

Test Notes:
Complete evac performed on 2/19/26

Low-Flow Readings:

Date Time	Elapsed Time	pH	Temperature	Specific Conductivity	RDO Concentration	Turbidity	ORP	Depth to Water	Salinity	Flow
		+/- 0.1	+/- 0.5	+/- 5 %	+/- 10 %	+/- 10	+/- 10	+/- 0.3	+/- 10	
2/20/2026 9:44 AM	00:00	7.756 pH	15.80 °C	429.4 µS/cm	7.107 mg/L	0.880 NTU	175.0 mV	94.70 ft	0.208 PSU	100.0 ml/min
2/20/2026 9:45 AM	01:00	7.742 pH	15.17 °C	424.3 µS/cm	7.179 mg/L	0.880 NTU	150.2 mV	94.70 ft	0.205 PSU	100.0 ml/min

Samples

Sample ID:	Description:
GWC-5	Metals, Inorganics, Bicarbonate Alkalinity
FD-01	Metals, Inorganics, Bicarbonate Alkalinity

Created using VuSitu from In-Situ, Inc.

Field Instrumentation Calibration Form

Site Name: Plant Bowen

Date: 02/12/2026

Calibrated By: Kyle Rhyne

Field Conditions: 36/58 °F sunny

Instrument	Manufactuer/ Model	Serial Number
Water Quality Meter	AquaTroll 400	843,593
Turbidity Meter	Hach	25090D000134

Calibration Standard Information				
Parameter	**Standard**	**Lot #**	**Date of Expiration**	**Brand**
Specific Conductance (µS/cm)	4,490	24021650	09/2026	Atlanta Instrument Rental, Inc.

	Sodium	NA	NA	NA	1.4
	Potassium	NA	NA	NA	0.74

Notes:
1. Results for constituents are reported in milligrams per liter (mg/L). pH reported in standard units (s.u.).
2. < indicates the constituent was not detected above the analytical reporting detection limit (RDL) shown.
3. J indicates the constituent was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number.
4. Appendix III - indicator parameters evaluated during Detection Monitoring.
5. TDS indicates Total Dissolved Solids
6. NA indicates consituent was not sampled
7. Semi-annual sampling of the Spring has been conducted in accordance with the previous Georgia Solid Waste Permit No 008-018D (LI) issued in 2007 and continues to date under the 2022 CCR Permit Groundwater Monitoring Plan (GWMP). The Spring was dry during events not listed on the table.

APPENDIX E
STATISTICAL ANALYSIS

GROUNDWATER STATS CONSULTING

August 31, 2026

Southern Company Services
Attn: Ms. Kristen Jurinko
241 Ralph McGill Blvd. NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Bowen Landfill Cells 1, 2, 9, and 10
Background Update & Statistical Analysis – February 2026 Sample Event

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and statistical analysis of groundwater quality for the February 2026 sample event for Georgia Power Company's Plant Bowen Landfill Cells 1, 2, 9, and 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-2R, GWA-3A, GWA-4RZ, GWA-39RZ, GWA-39Z, GWA-40, GWA-41, GWA-41R, GWA-42, GWA-43, GWA-43R, GWA-50, and GWA-50R
- **Downgradient wells:** GWC-5, GWC-6, GWC-6RZ, GWC-7Z, GWC-8RR, GWC-8Z, GWC-9, GWC-10, GWC-10R, GWC-11, GWC-11R, GWC-12, GWC-13, GWC-13RZ, GWC-14Z, GWC-15R, GWC-15Z, GWC-44, GWC-45, GWC-45R, GWC-46R, GWC-47, GWC-47R, GWC-48, GWC-49R, and GWC-49Z

Note that upgradient well GWA-3 was replaced with GWA-3A, which was first sampled in March 2021. Data from well GWA-3 have been combined with data from replacement well GWA-3A. A minimum of 8 samples has been collected from new well GWA-3A; therefore, the Mann-Whitney test of medians was used to compare newer observations collected only from well GWA-3A to historical observations collected from well GWA-3 for Appendix I and III constituents evaluated with intrawell prediction limits to determine whether the medians of data are statistically significantly different. For Appendix I and III constituents evaluated with interwell prediction limits, since these limits are constructed using pooled upgradient well data, trend tests are used on the full record for well GWA-3A to determine if statistically significant increasing or decreasing trends in groundwater quality are present. This analysis is discussed further below.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Founder and Senior Statistician for Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance.

The following constituents are evaluated:

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that the terms "parameters" and "constituents" are interchangeable throughout this report. When there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% non-detects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

Due to varying detection limits in background data sets, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contains varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the case of beryllium, the most recent reporting limit of 0.004 mg/L replaces elevated reporting limits earlier in the records.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the screening to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. A few well/constituent pairs have a limited background data set due either to sampling or truncation of background date ranges. As more samples are collected, these well/constituent pairs will meet the minimum power requirements. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc)
- Interwell Prediction Limits with 1-of-2 resample plan (mercury and thallium)
- # Constituents: 16
- # Downgradient wells: 26

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (boron, calcium, fluoride, sulfate, TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (chloride and pH)
- # Constituents: 7
- # Downgradient wells: 26

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects.
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric prediction limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points is available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to variation in groundwater quality. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, exceedances may occur as a result of variation in groundwater quality rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from variation in groundwater quality. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an apparent intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that

an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Historical Summary of Appendix I & Appendix III Background Screening & Update – Conducted in April 2022

Outlier Analysis

Tukey's outlier test and visual screening were used to evaluate data at all wells through February 2022. Tukey's test identified several potential outliers and confirmed previously flagged values. Some identified values were not flagged because they appeared to be representative of spatial variation. High values that were not identified by Tukey's test, but flagged as outliers, reduced variation among background datasets and resulted in statistical limits that are conservative (in most cases, lower) from a regulatory perspective. Note that previously flagged values for antimony at upgradient wells GWA-1 and GWA-2 along with downgradient well GWC-11R were unflagged during the background update as more recent values were of similar concentration. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. Summary tables of all flagged values follow this report (Figure C).

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled

upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. The ANOVA identified variation for all Appendix I & III parameters except for mercury and thallium; therefore, mercury and thallium will be tested with interwell statistical methods. All parameters were further evaluated as described for the appropriateness of intrawell testing to accommodate the groundwater quality. A summary table of the ANOVA results is included with the reports.

Eligibility of Intrawell Methods

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are conservative (i.e., lower) from a regulatory perspective, and that will rapidly identify a change in more recent compliance data from within a given well. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility. Prior to performing intrawell prediction limits, several steps are required to reasonably demonstrate downgradient water quality does not have existing impacts from the practices of the facility.

Exploratory data analysis was used as a general comparison of concentrations in downgradient wells for all Appendix I and III parameters recommended for intrawell analyses to concentrations reported in upgradient wells. Upper tolerance limits are used in conjunction with confidence intervals to determine whether the estimated averages in downgradient wells are higher than observed levels upgradient of the facility. Upper tolerance limits estimate an upper percentile (in this case the 99th percentile) with known confidence level and thus represent the upper range of likely background values. Tolerance limits are similar to prediction limits that are used for detection monitoring, but tolerance limits are constructed to contain a given fraction of the background population whereas prediction limits are constructed to contain a given number of future observations with known confidence level.

In cases where downgradient average concentrations are higher than observed concentrations upgradient for a given constituent, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting.

When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells, interwell prediction limits will initially be selected for the statistical method until further evidence shows that concentrations are due to spatial variation rather than a result of the facility.

Upper Tolerance Limits

Parametric tolerance limits were constructed with a target of 99% confidence and 95% coverage using pooled upgradient well data for each of the Appendix III parameters. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented and the confidence and coverage levels for nonparametric tolerance limits increase.

Confidence Intervals

Confidence intervals were constructed on downgradient wells for each of the Appendix I & III parameters, using the tolerance limits discussed above, to determine intrawell eligibility. When the entire confidence interval is above a background standard for a given parameter, interwell methods are initially recommended as the statistical method. Therefore, only parameters with confidence intervals which did not exceed background standards are eligible for intrawell prediction limits. Note that well/constituent pairs with 100% non-detects were deselected prior to construction of confidence intervals.

Confidence intervals for Appendix I & III parameters exceeded their respective background limits for beryllium, chloride, and pH. Therefore, for Appendix I parameters, interwell methods were initially recommended for beryllium, mercury, and thallium. Intrawell methods were initially recommended for antimony, arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc. For Appendix III parameters, interwell methods were recommended for chloride and pH. Intrawell methods were recommended for boron, calcium, fluoride, sulfate, and TDS.

Mann-Whitney - Intrawell

For constituents requiring intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through September 2018 for Appendix I constituents and through September 2019 for Appendix III constituents to the medians of the new compliance samples at each well through August 2021. Previously truncated data sets discussed above were also compared to the most recent set of measurements through August 2021. If the medians of the two groups are not

significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Note that no reports were produced for several well/constituent pairs as there was no variation in the data. Additionally, no Mann-Whitney test was run for barium at downgradient well GWC-13RZ since this well/constituent pair has been historically evaluated with a trend test in lieu of prediction limits due to due to steadily increasing data since early 2016.

Several statistically significant differences were found between the two groups for the Appendix I and III constituents. Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless updating results in the similar or more conservative limits, or it can be reasonably justified that the change in concentrations is unrelated to practices at the site. In studies in which at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians.

Statistically significant increasing medians were found for the following well/constituent pairs:

Appendix I:

- Barium: GWA-2R, GWA-4RZ (both upgradient), GWC-11R, and GWC-49R
- Cobalt: GWA-4RZ (upgradient)
- Zinc: GWC-47 and GWC-47R

Appendix III:

- Sulfate: GWC-14Z

Each respective record for these well/constituent pairs were updated with compliance data and are discussed below.

For upgradient well/constituent pairs with significant increases in medians (barium in wells GWA-2R and GWA-4RZ and cobalt in well GWA-4RZ), the increases in concentrations are, reportedly, not related to the facility and represent background conditions. For barium in downgradient well GWC-11R and sulfate in downgradient well GWC-14Z, the concentrations are relatively low, and updating the records does not result in high limits compared to limits at upgradient wells for the same constituents. For barium in downgradient well GWC-49R, the compliance samples remain within range of concentrations upgradient of the facility and the pattern is very similar to that of upgradient well GWA-4RZ which has higher reported concentrations; therefore, this well/constituent pair was updated. Regarding zinc in downgradient wells GWC-47 and

GWC-47R, the most recent concentrations in these wells are, reportedly, due to variation in groundwater quality, are somewhat similar to historical concentrations detected in these wells, are marginally higher than the current reporting limit, and remain within the range of upgradient concentrations. Therefore, the records for these well/constituent pairs were updated.

A large number of well/constituent pairs for Appendix I and Appendix III constituents had statistically significant decreasing medians in more recent data. A summary of the significant cases was listed in the summary tables for Appendix I and Appendix III Mann-Whitney results. In most cases with significant results, the differences were relatively small, the most recent measurements were similar to measurements in the early part of the record, or the update resulted in similar or more conservative limits. Therefore, the majority of these records were updated. For parametric limits, however, a decreasing difference can result in higher variance, which tends to increase the limit. For the following cases, earlier portions of the records were truncated to reduce variability among background data, utilize concentrations that appear to have stabilized, and deselect elevated historical concentrations:

Appendix I:

- Vanadium: GWC-15Z
- Zinc: GWC-5

Appendix III:

- Calcium: GWC-49Z
- Sulfate: GWC-49Z

Any adjustments are shown in the Date Range Table in addition to adjustments listed for chromium, copper, and nickel from previous analysis.

Upgradient Well Trend Tests – Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the parameters tested using interwell prediction limits-- mercury and thallium (Appendix I), and chloride and pH (Appendix III) to identify statistically significant increasing or decreasing trends in background. The results of the trend analyses showed no statistically significant increasing or decreasing trends for Appendix I constituents. For the Appendix III constituents, no statistically significant increasing trends were identified. The following statistically significant decreasing trends were noted:

- Chloride: GWA-1, GWA-39Z, GWA-41, and GWA-41R
- pH: GWA-2R, GWA-41R, GWA-43, GWA-50, and GWA-50R

Truncation of upgradient well records to remove trends should be done with caution since the higher concentrations could appear in future years at downgradient wells in the absence of facility impacts. Therefore, no adjustments were made at the time. While no statistically significant trend was identified for pH in upgradient well GWA-3A, it was noted that the more recent reported measurements since March 2021 are higher than those reported historically. No truncation of the record was required since interwell prediction limits, which pool upgradient well data, are used to evaluate pH and reported measurements are similar to those reported in neighboring upgradient wells.

Mann-Whitney Test & Trend Tests – GWA-3A – Spring 2025

During the Spring 2025 report, a minimum of 8 background samples had been collected from well GWA-3A since March 2021; therefore, the Mann-Whitney test was used to compare historical observations through March 2020 collected from well GWA-3 to newer observations through August 2024 from replacement well GWA-3A for Appendix I and III constituents. The Mann-Whitney test is a two-sample test which evaluates the medians of the background and compliance data to determine whether the medians are statistically significantly different. Statistically significant differences were identified for the following constituents:

- barium, calcium, copper, fluoride, nickel, sulfate, TDS, and zinc

In the cases where statistically significant differences were identified at the 99% confidence level, the historical record was truncated so that only data from the new well is used in construction of intrawell prediction limits for Appendix I and III constituents. Exceptions include the records for barium and fluoride at well GWA-3A because while the Mann-Whitney test identified statistically significant differences in medians, the more recent concentrations are within the range of historic concentrations from well GWA-3. Additionally, higher measurements earlier in the record remain flagged as outliers for barium at well GWA-3A and are not included in construction of statistical limits. A list of well/constituent pairs using a truncated portion of their record follows this report.

For Appendix I and III constituents evaluated with interwell prediction limits, since these limits are constructed using pooled upgradient well data, trend tests were used on the full record through March 2025 for well GWA-3A to determine if statistically significant increasing or decreasing trends in groundwater quality are present. No statistically significant trends were identified; therefore, no further action was required.

Summary of Appendix I & Appendix III Background Update – Conducted in April 2026

Following discussions regarding additional geochemical studies conducted by Stantec, beryllium was reclassified to be evaluated using intrawell prediction limits. All wells were screened for outliers and trends using data through August/September 2025 for beryllium to evaluate the February 2026 samples.

Outlier Analysis

Prior to updating prediction limits during the Spring 2026 statistical analysis, Tukey's outlier test and visual screening were used to evaluate data at all wells through August/September 2025 for constituents evaluated with intrawell prediction limits and at upgradient wells through February 2026 for constituents evaluated with interwell prediction limits.

Tukey's test for parameters evaluated using intrawell prediction limits identified potential outliers for antimony, arsenic, barium, boron, calcium, chromium, cobalt, copper, fluoride, lead, nickel, sulfate, TDS, vanadium, and zinc. Visual screening and Tukey's outlier test confirmed previously flagged values with the exception of a previously flagged outlier for chromium at downgradient well GWC-47R, which was unflagged because the observation was similar to more recent concentrations. Among values identified by Tukey's test, the highest values for chromium at wells GWC-6RZ and GWC-47R, and for TDS at wells GWA-50, GWC-6, and GWC-15Z were flagged as outliers during this update. Any values identified by Tukey's test but not flagged were similar to surrounding concentrations within the respective record or resulted in statistical limits representative of near-term and potentially future background. Although not identified by Tukey's outlier test, the highest values for barium at well GWC-47R, calcium at well GWC-49Z, chromium at well GWC-5, nickel at well GWC-45R, sulfate at well GWC-14Z, and TDS at wells GWC-14Z, GWC-15R, and GWC-44, along with the lowest values for TDS at wells GWC-13RZ and GWC-45R were identified by visual screening and flagged during this update in order to construct statistical limits capable of detecting changes in groundwater quality.

Tukey's outlier test on pooled upgradient well data for parameters using interwell prediction limits identified outliers for chloride; however, these measurements were not flagged as outliers as the concentrations were similar to those reported among neighboring upgradient wells. Additionally, the resulting statistical limits are representative of near-term and potentially future background. No additional values were flagged among upgradient wells for Appendix I and III parameters evaluated with interwell prediction limits.

While concentrations from downgradient wells do not impact interwell prediction limits which are constructed from pooled upgradient well data, high values for pH at downgradient wells GWC-8Z, GWC-13RZ, GWC-14Z, and GWC-15Z remain flagged because these observations are several standard deviations above remaining measurements in the respective records.

As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney - Intrawell

For constituents requiring intrawell prediction limits, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2023 for Appendix I & III constituents to the medians of the new compliance samples at each well through the respective Fall 2025 sample event (Figure D). Previously truncated data sets discussed above were also compared to the most recent set of measurements through August 2023. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Note that reports were not produced for several well/constituent pairs when no variation in the data was present. Statistically significant differences (either an increase or decrease in median concentrations) were found between the two groups for the Appendix I and III constituents:

Appendix I

Increase

- Barium: GWC-48
- Nickel: GWA-42 (upgradient) and GWC-48

Decrease

- Antimony: GWA-1 (upgradient) and GWC-7Z
- Barium: GWA-41, GWA-43, GWA-50R (all upgradient), GWC-5, GWC-6RZ, GWC-7Z, GWC-8RR, and GWC-15R
- Chromium: GWC-13
- Copper: GWA-50 (upgradient)
- Vanadium: GWC-45R

Appendix III

Increase

- Calcium: GWA-42 (upgradient)
- Sulfate: GWC-9, GWC-47, and GWC-48

Decrease

- Calcium: GWA-43, GWA-50R (both upgradient), and GWC-15R
- Sulfate: GWA-39RZ (upgradient), GWC-5, GWC-6, GWC-8Z, GWC-15R, GWC-15Z, GWC-46R, GWC-49Z, and GWC-49R
- TDS: GWC-15R

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless updating results in the similar or more conservative limits, or it can be reasonably justified that the change in concentrations is unrelated to practices at the site. In studies where at least one of the segments being compared is of short duration, the comparison is complicated by the fact that normal short-term variation may be mistaken for long-term change in medians.

For well/constituent pairs with significant increases in medians among upgradient wells, the increases in concentrations are, reportedly, not related to the facility and represent background conditions. Records for downgradient well/constituent pairs with statistically significant increases in median concentrations were also updated through Fall 2025 since the compliance measurements were similar to or within the range of historic concentrations. Exceptions include the records for barium and nickel in downgradient well GWC-48 as compliance observations are higher than existing background concentrations within each record and show an increasing trend. All records will be re-evaluated during the next update, and should concentrations stabilize, background data for these well/constituent pairs may be updated.

Several statistically significant decreasing medians were identified in more recent data for Appendix I and Appendix III constituents. The significant cases are provided with the report in the summary tables for Appendix I and Appendix III Mann-Whitney results. In most cases, the differences were relatively small, the more recent measurements were similar to measurements in the early part of the record, or updating the records resulted in similar or more conservative (i.e., lower) limits. Therefore, all records were updated.

The following well/constituent pairs identified with decreases in medians, however, had earlier portions of their records truncated in order to reduce variability among background data, remove the influence of any possible trends, utilize concentrations that appear to have stabilized, and remove elevated historic concentrations:

- Barium: GWC-6RZ
- Sulfate: GWC-8Z

Any adjustments are shown in the Date Range Table in addition to adjustments listed from previous updates.

GWA-3A Trend Tests – Intrawell

While well GWA-3A did not have sufficient compliance observations to be tested with the Mann-Whitney test, records for well GWA-3A for calcium, copper, nickel, sulfate, TDS, and zinc were evaluated with the Sen's Slope/Mann Kendall trend test to assess data through September 2025 to identify statistically significant increasing or decreasing trends in background at the 99% confidence level (Figure E). The results of the trend analyses showed a statistically significant increasing trend for TDS at GWA-3A; however, the record has limited samples at this time and truncation of earlier observations would have a marginal effect on the resulting statistical limit. Therefore, the full records from March 2021 onward will be used to construct statistical limits.

Beryllium Trend Tests – Intrawell

While trends may be visual, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends (Figure F). In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant trends are present, earlier data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. A summary report will be provided to show the date ranges used in construction of the statistical limits, when the historical records of data are truncated for the aforementioned reasons. Statistically significant trends were identified for the following wells:

Increasing
- GWC-5 and GWC-48

Decreasing
- GWC-8Z, GWC-9, GWC-10, and GWC-14Z

Note that in the case of beryllium at downgradient wells GWC-8Z, GWC-10, and GWC-14Z, the statistically significant trends indicate a zero slope, which represents the median slope of all possible pairwise slopes within these records. The zero slope is a result of several trace values below the current reporting limit and reported non-detect measurements replaced with the same value of the most recent reporting limit. The

significant trends identified at GWC-5 and GWC-9 are byproducts of several non-detects early in the record followed by more recent observations either detected above the most recent reporting limit or reported below the most recent reporting limit, respectively. Although a statistically significant increasing trend was also identified for GWC-48, more recent concentrations are either slightly above or below the most recent reporting limit of 0.0004 mg/L. Therefore, no records required truncation for beryllium at this time.

Upgradient Well Trend Tests – Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate data through February 2026 at upgradient wells for mercury and thallium (Appendix I) and chloride and pH (Appendix III), which are tested using interwell prediction limits, to identify statistically significant increasing or decreasing trends in background at the 99% confidence level (Figure G). The results of the trend analyses showed no statistically significant increasing or decreasing trends for Appendix I constituents. For the Appendix III constituents, no statistically significant increasing trends were identified. The following statistically significant decreasing trends were noted:

- Chloride: GWA-1, GWA-3A, GWA-39RZ, GWA-39Z, GWA-41, GWA-41R, GWA-43R, GWA-50, and GWA-50R
- pH: GWA-1, GWA-2R, GWA-4RZ, GWA-40, GWA-41R, GWA-42, GWA-43, GWA-50, and GWA-50R

As mentioned above, truncation of upgradient well records to remove trends should be done with caution since the higher concentrations could appear in future years at downgradient wells in the absence of facility impacts. Additionally, resulting statistical limits are representative of current groundwater quality conditions. Therefore, no adjustments were made at this time. As mentioned earlier, while no statistically significant trend was identified for pH in upgradient well GWA-3A, it was noted that the more recent reported measurements since March 2021 are higher than those reported historically. No truncation of the record was required since interwell prediction limits, which pool upgradient well data, are used to evaluate pH and reported measurements are similar to those reported in neighboring upgradient wells.

Evaluation of Georgia EPD Appendix I Constituents – February 2026

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver,

vanadium, and zinc were constructed using all available historical data through Fall 2025, except for the cases mentioned above, which use a truncated portion of the respective record. A list of those records is provided in the Date Range Table.

Compliance data from the February 2026 sample event were compared to these limits (Figure H). No statistical analyses were included for well/constituent pairs with 100% non-detects. A summary of those well/constituent pairs follows this letter.

As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing intrawell prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. Summaries of the Georgia EPD Appendix I prediction limits follow this report. No exceedances were identified.

Two-Step Approach

In accordance with the two-step approach, interwell prediction limits are constructed using pooled upgradient well data to further evaluate apparent intrawell exceedances among downgradient wells. Because no intrawell prediction limit exceedances were identified, no further action was required.

Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed for mercury and thallium using all historical upgradient well data through February 2026 (Figure I). As mentioned above, upgradient well data were reassessed for potential outliers during this analysis. When values in background are flagged as outliers, the measurements may be seen in a lighter font and as a disconnected symbol on the graphs. No values were flagged as outliers at any of the upgradient wells for Appendix I constituents tested using interwell prediction limits.

Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The February 2026 sample from each downgradient well was compared to the background limit to determine whether exceedances over background are present. An exceedance was identified for the following well/constituent pair:

- Mercury: GWC-48

Trend Tests

When an exceedance occurs in a downgradient well, the exceedance is further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level--whether or not the exceedance is confirmed as an SSI--in addition to interwell prediction limits in accordance with the two-step analysis (Figure J). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. No statistically significant trends were identified.

Evaluation of CCR Appendix III Parameters – February 2026

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed for boron, calcium, fluoride, sulfate, and TDS using all historical data at each well through Fall 2025 (Figure K). Results and a summary table follow this report. The February 2026 observation from each downgradient well was compared its respective background limit to determine whether exceedances over background are present. Apparent exceedances were identified for the following well/constituent pairs:

- Calcium: GWA-3A (upgradient), GWC-9, and GWC-12

When prediction limit exceedances are identified upgradient of the facility, it is an indication of changing groundwater quality unrelated to practices at the landfill.

Two-Step Approach

When interwell prediction limits were constructed using pooled upgradient well data through February 2026 for the apparent intrawell prediction limit exceedances in downgradient wells, no exceedances were identified (Figure L).

Interwell Prediction Limits

Upgradient well data were reassessed for potential outliers during this analysis. When values in background are flagged as outliers, the measurements may be seen in a lighter font and as a disconnected symbol on the graphs. No values were flagged as outliers at any of the upgradient wells for Appendix III constituents.

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed for chloride and pH using all historical upgradient well data through February 2026 (Figure M). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. Results and a summary table follow this report.

When the February 2026 samples from each downgradient well were compared to the interwell prediction limits for chloride and pH, a statistically significant exceedance was identified for the following well/constituent pair:

- pH (lower limit): GWC-44

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limits were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents. A summary of the trend test results follows this letter (Figure N). Statistically significant trends were identified for the following well/constituent pairs:

Increasing
- Calcium: GWA-1, GWA-4RZ, GWA-42, and GWA-43R (all upgradient)

Decreasing
- Calcium: GWA-43, GWA-50R, and GWA-50 (all upgradient)
- pH: GWA-1, GWA-2R, GWA-4RZ, GWA-40, GWA-42, GWA-43, GWA-50R, GWA-50 (all upgradient), and GWC-44

Resample Reports – May 2026

Additional data were collected in May 2026 for calcium, chloride, pH, and sulfate at downgradient wells GWC-5 and GWC-48, beryllium at well GWC-5, and mercury at well GWC-48. Intrawell prediction limits were constructed using background data through Fall 2025 to compare the resamples for calcium, sulfate, and beryllium (Figures O and P). No exceedances were identified.

Interwell prediction limits were constructed using background data through February 2026 to compare the resamples for chloride and pH at downgradient wells GWC-5 and GWC-48, and for mercury at well GWC-48 (Figures Q and R). The reported resample of 0.00067 mg/L for mercury at well GWC-48 exceeded its respective limit of 0.0002 mg/L.

Summary

Georgia EPD Appendix I

Based on the results of the Appendix I prediction limits and the two-step approach, an exceedance was identified for the following well/constituent pair:

- Mercury: GWC-48

CCR Appendix III

Based on the results of the Appendix III prediction limits, an exceedance was identified for the following well/constituent pair:

- pH: GWC-44

Trend tests were performed for all apparent intrawell and interwell exceedances and corresponding upgradient wells. Results are presented in the corresponding tables.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill Cells 1, 2, 9 and 10. If you have any questions or comments, please feel free to contact us.

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 8/10/2026 3:46 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

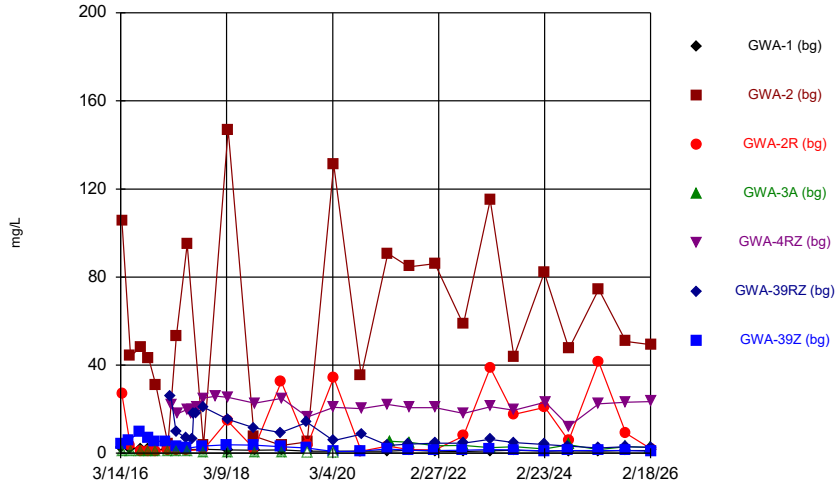
Constituent: Silver Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

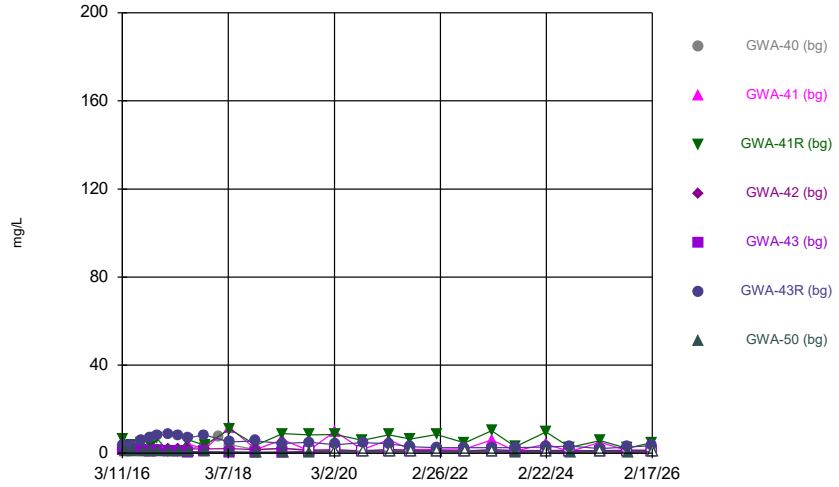
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

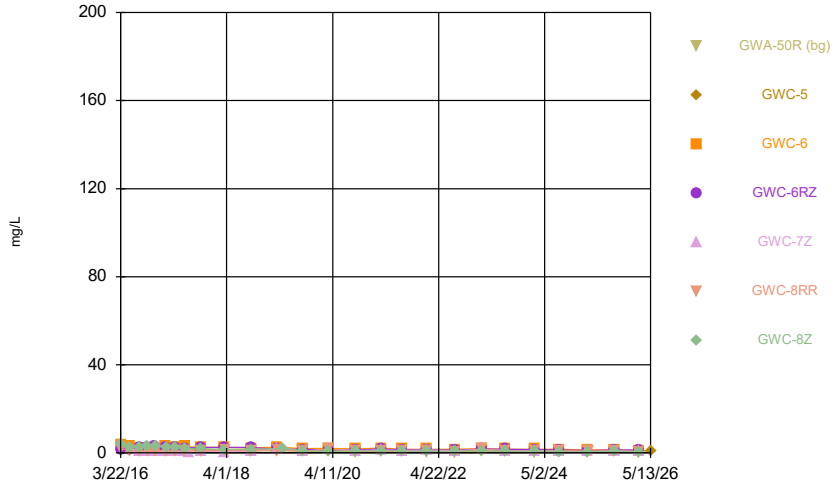
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

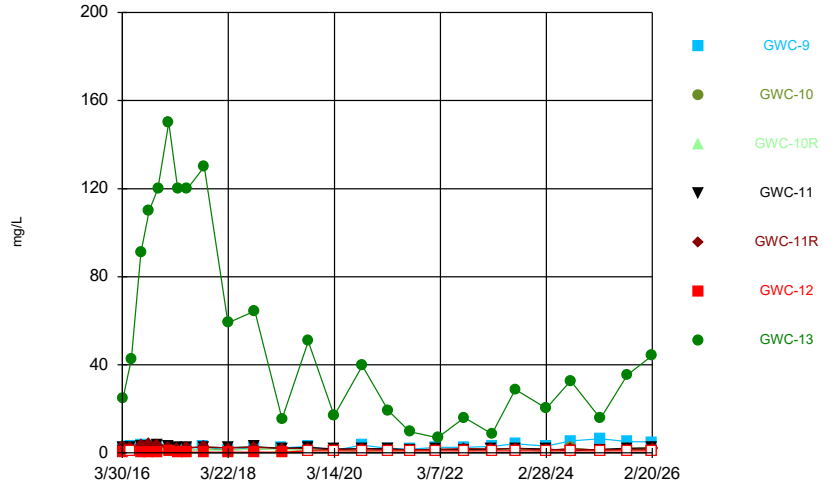
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

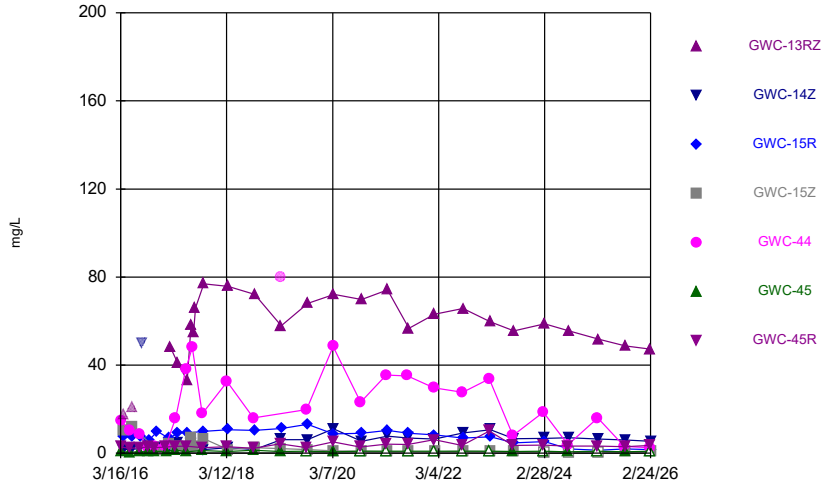
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

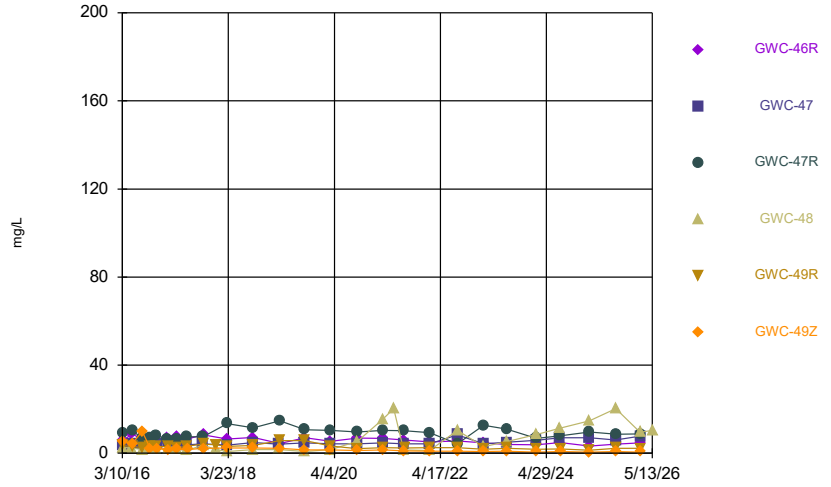
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG

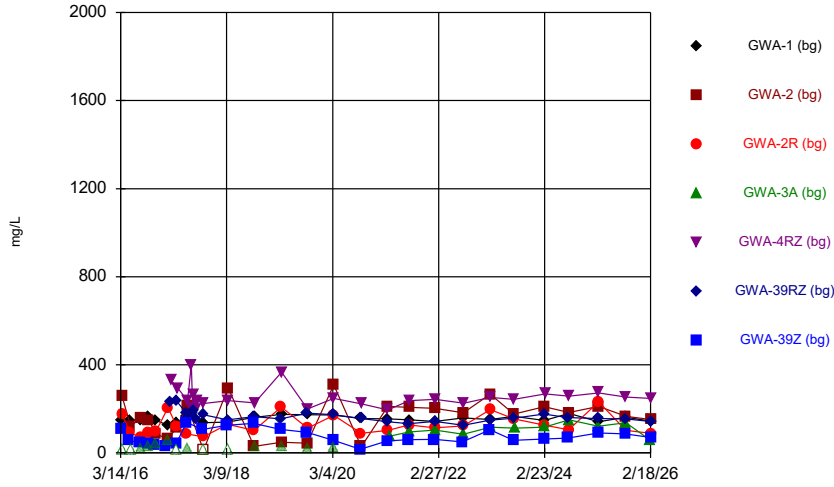
Time Series



Constituent: Sulfate Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

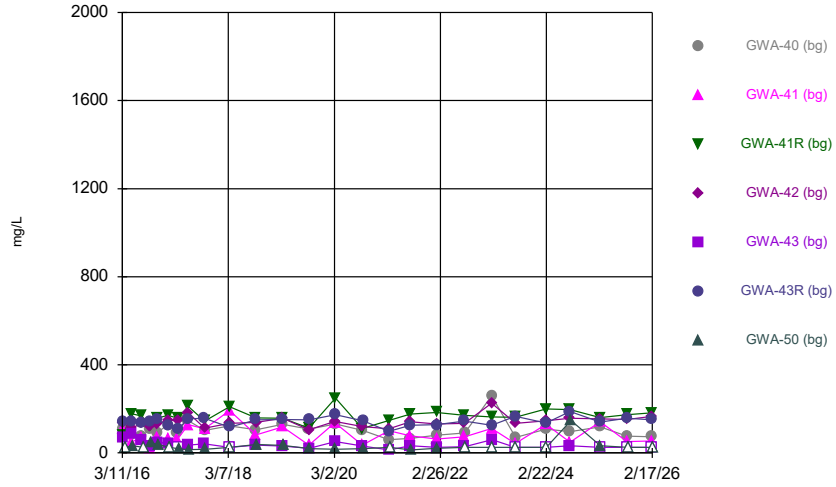
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

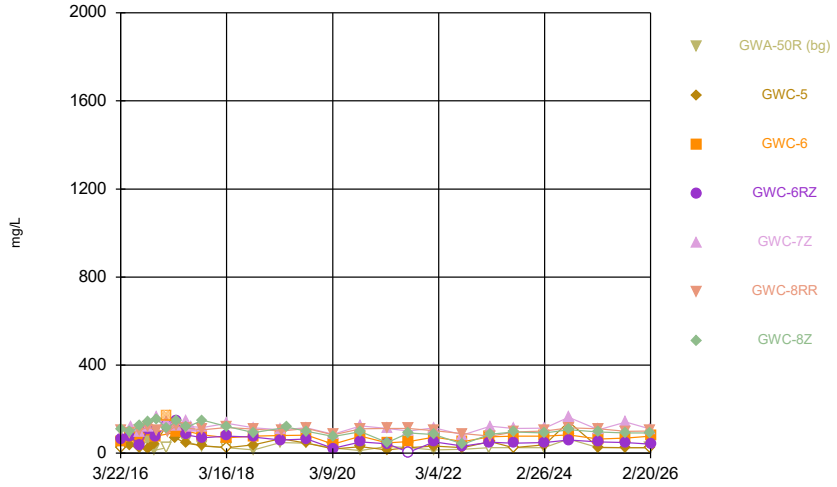
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

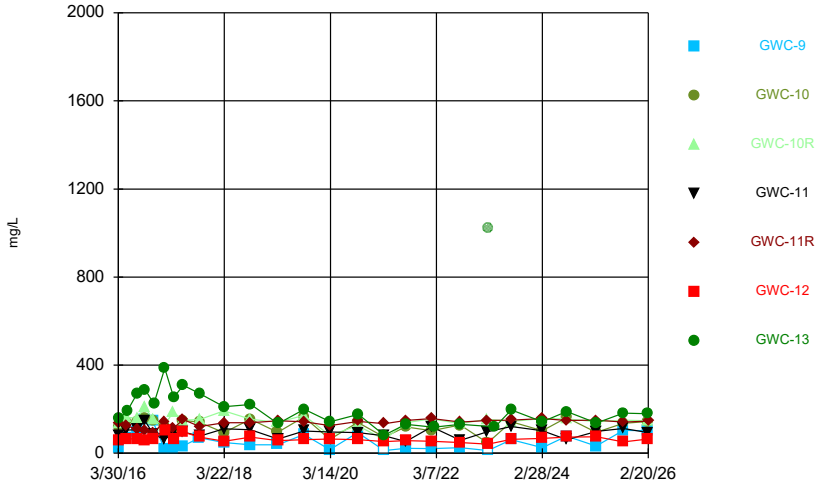
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

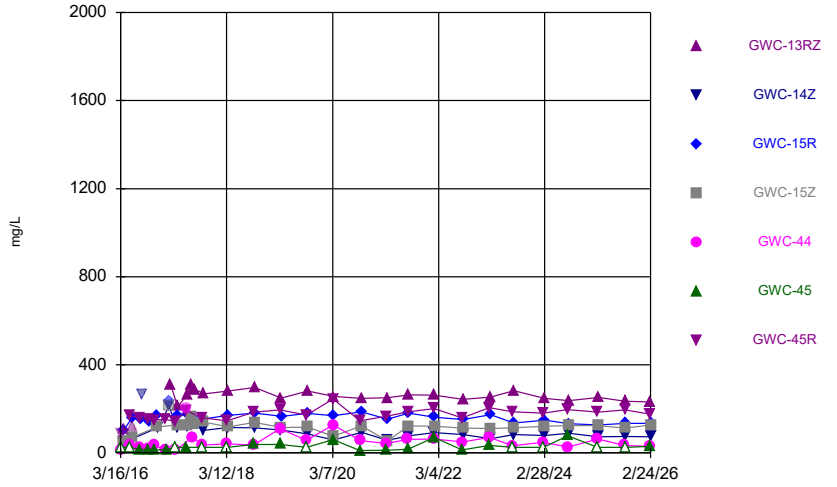
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

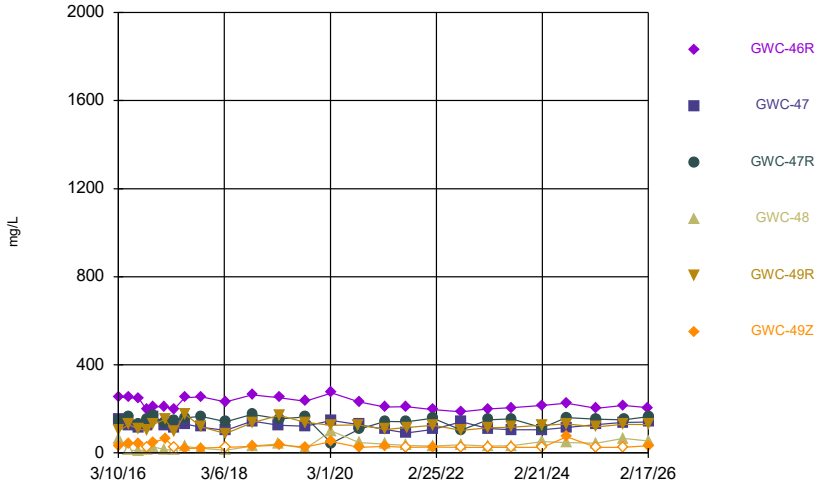
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

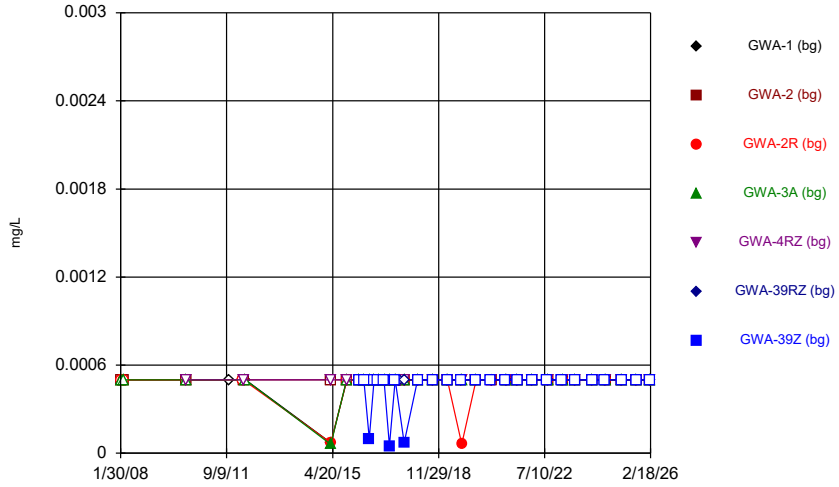
Time Series



Constituent: TDS Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

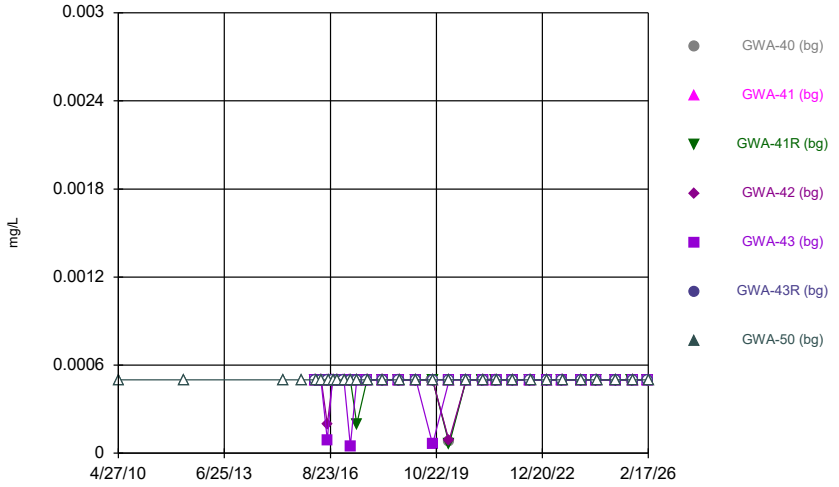
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

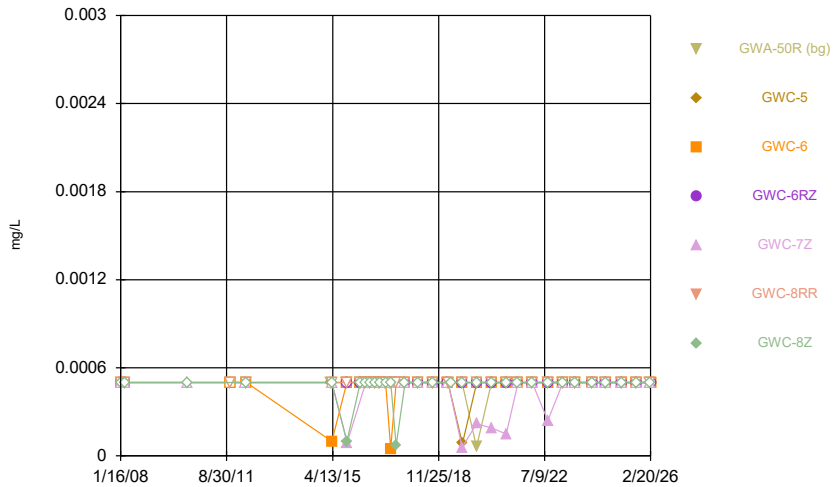
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

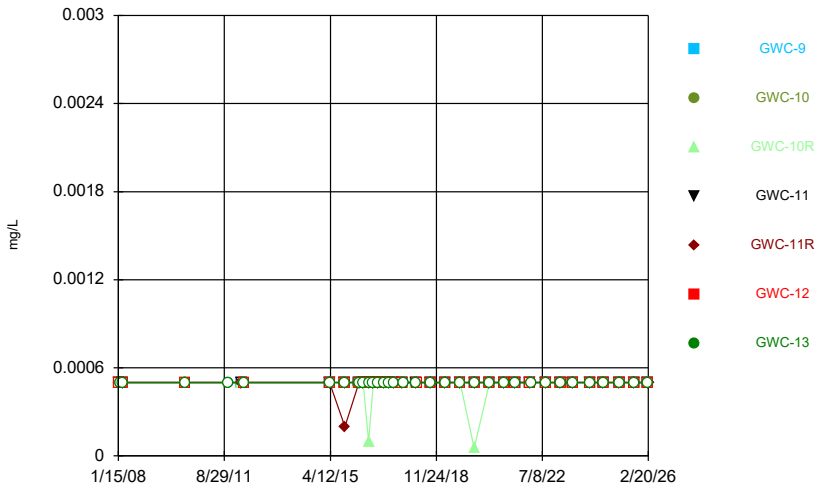
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

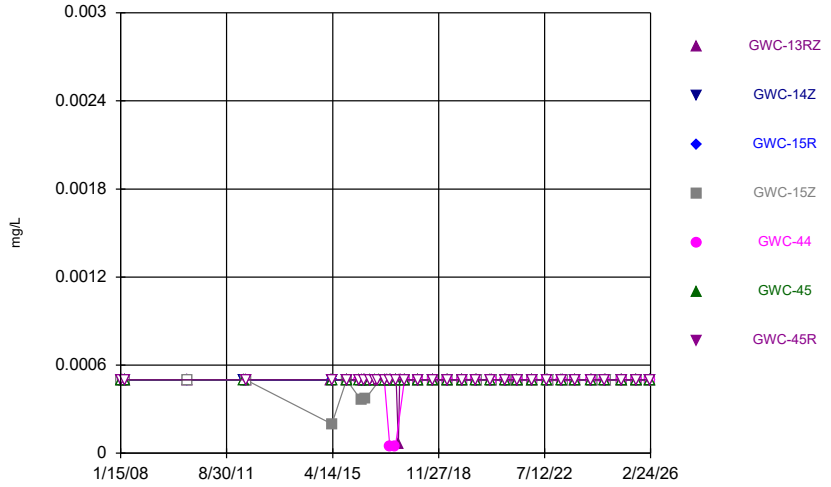
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

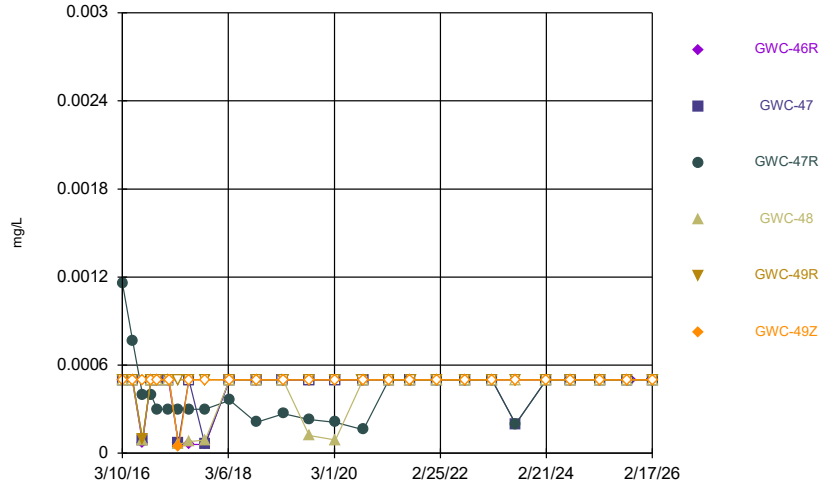
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

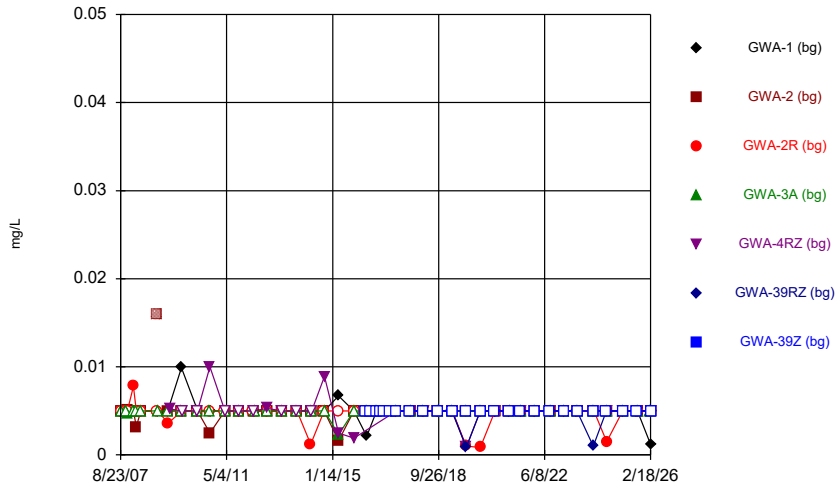
Time Series



Constituent: Thallium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

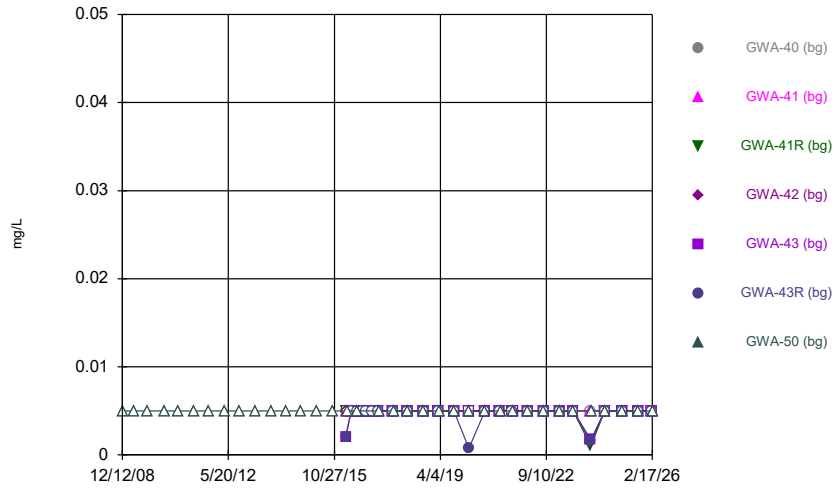
Time Series



Constituent: Vanadium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

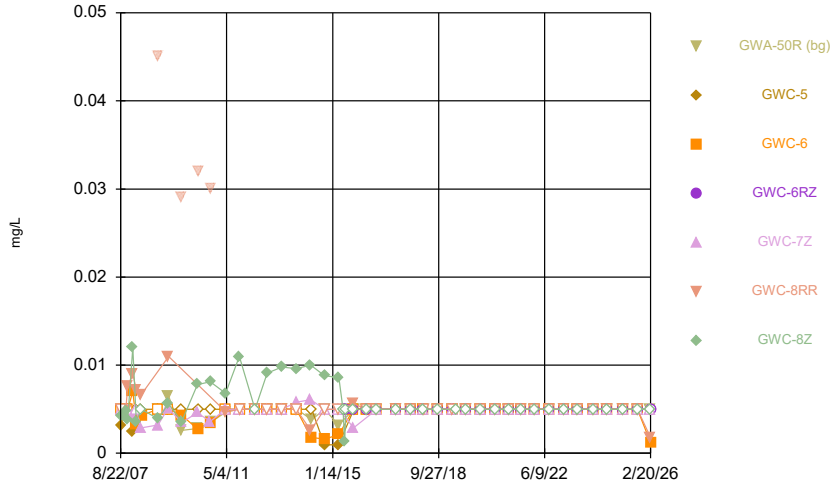
Time Series



Constituent: Vanadium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10

Sanitas™ v.10.1.08 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series



Constituent: Vanadium Analysis Run 8/10/2026 3:47 PM
Plant Bowen Client: Southern Company Data: Bowen 1, 2, 9, & 10
