Prediction Limit
Intrawell Non-parametric, GWC-45

Non-parametric test used after natural log transformation resulted in a parametric limit of 24.66, which exceeds 10 times the highest background value (user-adjustable cutoff). Limit is highest of 12 background values. 41.67% NDs. Well-constituent pair annual alpha = 0.004342. Individual comparison alpha = 0.002173 (1 of 3). Assumes 1 future value.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 96 background values. 66.67% NDs. Annual per-constituent alpha = 0.003776. Individual comparison alpha = 0.0002102 (1 of 2). Comparing 9 points to limit.

Constituent: Boron Analysis Run 8/28/2019 1:10 PM View: cells9&10_AppIII_interwell
Plant Bowen Client: Southern Company Data: Bowen 9&10 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 96 background values. 48.96% NDs. Annual per-constituent alpha = 0.003776. Individual comparison alpha = 0.0002102 (1 of 2). Comparing 9 points to limit.

Constituent: Fluoride Analysis Run 8/28/2019 1:10 PM View: cells9&10_AppIII_interwell
Plant Bowen Client: Southern Company Data: Bowen 9&10 CCR

Exceeds Limits: GWC-44, GWC-45, GWC-47R, GWC-48

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 101 background values. Annual per-constituent alpha = 0.006818. Individual comparison alpha = 0.0003794 (1 of 2). Comparing 9 points to limit.

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 30 background values. 50% NDs. Well-constituent pair annual alpha = 0.004011. Individual comparison alpha = 0.002008 (1 of 2).

Constituent: Antimony Analysis Run 1/15/2020 9:17 AM View: PL's - Bedrock
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 32) were censored; limit is most recent reporting limit. Well-constituent pair annual alpha = 0.003603. Individual comparison alpha = 0.001803 (1 of 2).

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 91 background values. 75.82% NDs. Annual per-constituent alpha = 0.007798. Individual comparison alpha = 0.0002302 (1 of 2). Comparing 17 points to limit.

Constituent: Boron Analysis Run 1/10/2020 11:57 AM View: Cells1&2_AppIII_Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Exceeds Limit: GWC-13, GWC-14_14Z,
GWC-13R_13RZ

Prediction Limit
Interwell Parametric

Background Data Summary (based on cube root transformation): Mean=1.114, Std. Dev.=0.1611, n=91, 6.593% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.974, critical = 0.962. Kappa = 2.097 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004426. Comparing 17 points to limit.

Constituent: Chloride Analysis Run 1/10/2020 11:57 AM View: Cells1&2_AppIII_Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 91 background values. 50.55% NDs. Annual per-constituent alpha = 0.007798. Individual comparison alpha = 0.0002302 (1 of 2). Comparing 17 points to limit.

Constituent: Fluoride Analysis Run 1/10/2020 11:57 AM View: Cells1&2_AppIII_Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Exceeds Limits: GWC-15_15Z, GWC-8RR

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 92 background values. Annual per-constituent alpha = 0.0153. Individual comparison alpha = 0.0004518 (1 of 2). Comparing 17 points to limit.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 156 background values. 68.59% NDs. Annual per-constituent alpha = 0.00178. Individual comparison alpha = 0.00008098 (1 of 2). Comparing 11 points to limit.

Constituent: Boron Analysis Run 1/10/2020 1:12 PM View: Cells3&4_AppIII_interwell
Plant Bowen Client: Southern Company Data: Bowen 3&4 CCR

Exceeds Limit: GWC-16R, GWC-17R, GWC-21R, GWC-23R

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 156 background values. Annual per-constituent alpha = 0.00178. Individual comparison alpha = 0.00008098 (1 of 2). Comparing 11 points to limit.

 Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 10 background values. 20% NDs. Well-constituent pair annual alpha = 0.006868. Individual comparison alpha = 0.00344 (1 of 3). Insufficient data to test for seasonality: data were not deseasonalized.

Prediction Limit
Intrawell Parametric

Background Data Summary (based on square root transformation) (after Kaplan-Meier Adjustment): Mean=0.09783, Std. Dev.=0.01143, n=10, 40% NDs. Insufficient data to test for seasonality: data were not deseasonalized. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8081, critical = 0.781. Kappa = 2.026 (c=16, w=5, 1 of 3, event alpha = 0.05132). Report alpha = 0.0006583.

Constituent: Zinc Analysis Run 1/15/2020 11:26 AM View: Overburden Wells
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 10 background values. 50% NDs. Well-constituent pair annual alpha = 0.006868. Individual comparison alpha = 0.00344 (1 of 3). Insufficient data to test for seasonality: data were not deseasonalized.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 104 background values. 65.38% NDs. Annual per-constituent alpha = 0.003253. Individual comparison alpha = 0.000181 (1 of 2). Comparing 9 points to limit.

Constituent: Boron Analysis Run 1/10/2020 1:43 PM View: cells9&10_AppIII_interwell
Plant Bowen Client: Southern Company Data: Bowen 9&10 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 104 background values. 50.96% NDs. Annual per-constituent alpha = 0.003253. Individual comparison alpha = 0.000181 (1 of 2). Comparing 9 points to limit.

Constituent: Fluoride Analysis Run 1/10/2020 1:44 PM View: cells9&10_AppIII_interwell
Plant Bowen Client: Southern Company Data: Bowen 9&10 CCR

Exceeds Limits: GWC-44, GWC-45, GWC-48, GWC-49R, GWC-49Z

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 109 background values. Annual per-constituent alpha = 0.005987. Individual comparison alpha = 0.0003331 (1 of 2). Comparing 9 points to limit.

APPENDIX D
MEMORANDUM ON HYDROGEOLOGIC MONITORING PROGRAM

Memo

To: Joju Abraham, P.G.
Southern Company Services, Inc.

From: Rhonda Quinn, P.G. Wood Environment & Infrastructure Solutions, Inc.

CC: Greg Wrenn, P.E. Wood Environment & Infrastructure Solutions, Inc.

Re: Solid Waste Disposal Facility Permit No. 008-018D (LI) - Hydrogeological Monitoring Program May 1, 2019 through October 31, 2019
1/24 /2020

Background

Wood Environment & Infrastructure Solutions, Inc. (Wood) was retained by Southern Company Services, Inc. (SCS), to assist with the hydrogeological (water level) monitoring program at Georgia Power Company's Plant Bowen (Site) monofill landfill cells 1 & 2, 3 & 4, 9 & 10. The work is being conducted to comply with Georgia Department of Natural Resources Environmental Protection Division (EPD) Solid Waste Permit No. 008-018D (LI) to assist with early detection of subsurface changes that might indicate land subsidence or sinkhole formation. Groundwater level fluctuations are monitored in accordance with Section 3.6.5 of the *Plant Bowen Proposed Coal Combustion By-Product Monofill Addendum I Site Acceptability Report – Hydrogeological Assessment and Demonstration of Engineering Measures* (SCS 2004).¹

The Site utilizes In-Situ[®] Instruments, Inc. Win-Situ[®] telemetry and reporting software and pressure transducers to collect and record groundwater elevations from monitoring wells located around the perimeter of the landfill cells. At Cells 1 & 2 of the solid waste landfill, transducers are deployed in five soil wells (GWA-1 (soil/rock), GWA-3, GWC-7Z, GWC-11, GWC-13, and GWC-15) and six rock wells (GWA-2R, GWC-6RZ, GWC-8RR, GWC-11R, GWC-13R, and GWC-15R). In 2015, the program was expanded to include Cells 3 & 4 where five soil wells (GWC-18, GWA-36, GWA-37, GWA-53, and GWA-55) and eight rock wells (GWC-16R, GWC-18R, GWC-21R, GWC-24R, GWC-25R, GWA-36R, GWA-53R, and GWA-55R) are equipped with transducers. In 2016, the program was expanded further to include Cells 9 & 10 where currently six soil wells (GWA-39Z, GWA-41, GWA-43, GWC-45, GWC-47, and GWC-49Z)

and six rock wells (GWA-39RZ, GWA-41R, GWA-43R, GWC-45R, GWC-47R, and GWC-49R) are equipped with transducers. Etowah River levels for the reporting period were obtained from a U.S. Geological Survey gauge (02394670) near Cartersville, Georgia. Rainfall data for this monitoring period was collected from U.S. Geological Survey gauge (02394670) rain gage monitoring station.

Water level data are electronically logged multiple times daily by each transducer. Most logged data are uploaded after each reading via satellite telemetry to a central In-Situ® database. Automated reports are accessible via the In-Situ® database website where the telemetry data are stored and compiled. Data from wells not connected to the site telemetry system are manually downloaded directly from the transducer because the transducers are set to log and store data internally multiple times throughout each day. Water level data are monitored for unusual groundwater level fluctuations.

Maintenance Observations

During the reporting period, the following well locations (GWC-7Z, GWC-11, GWC-11R, GWC-13, GWC-13R, GWA-37, GWC-49R, and GWC-49Z) were visited on two or more occasions for maintenance, manual data downloads, battery change outs, removal of transducer or controller unit and returned to In-Situ® for repairs. The data, during this reporting period, for these transducer locations are not continuous due to transducers being offline during repairs. During the past six-month period, a transducer at location GWC-11R was returned to In-Situ® for repair. Ants infested the external battery compartment of the transducers in wells GWC-11 and GWC-11R resulting in the communication signal being interrupted for GWC-11 and data was omitted between May 29, 2019 through September 3, 2019 on Figure 1B. Ants were also observed at location GWC-13 and GWC13R which also led to intermittent signals observed on Figure 1B. Due to Net Hub adjustments, some data gaps of data were observed at location GWC-49Z from July 18, 2019 to July 25, 2019 and from July 26, 2019 to July 29, 2019. Wood has continued to update the firmware to current versions at each location since November 2018 to improve communication.

Water Level Fluctuations

Continuous groundwater level data and river stage elevations were recorded between May 1, 2019 and October 31, 2019. Reporting period hydrographs for Cells 1 & 2, 3 & 4, and 9 & 10 are shown in Figures 1A through 3B.

Table 1 lists the groundwater sampling, water level gaging and transducer maintenance activities during the reporting period and are considered known disruptions. Figures 1A through 3B show

the transducer water level data for the reporting period. Table 2 summarizes the data gaps or maintenance issues for the reporting period and recommendations for repairs and includes the most recent repairs completed up to October 31, 2019. Repairs consisted of resetting reference water elevation depth, resealing boxes, ant infestation control, and replacing power controller units and batteries. Over time the transducer elevation drifts, possibly attributed to the transducer being periodically removed for sampling, gauging or maintenance activities. To remedy this, in June 2018 through January 2019, maintenance was initiated to mark and mount the transducer cable to a fixed location such that the transducer is consistently returned to the same depth. When an adjustment is made, the reference depth to actual water elevation is re-set and the logging cycle re-started. The marking and securing of the transducers continued during this reporting period. Table 2 is a record of the maintenance completed during the reporting period.

The water levels in monitoring wells equipped with transducers exhibited similar overall trends during the reporting period. Groundwater elevations show an overall declining trend during this six month period with four increasing trends of short-duration. Two small increasing trends (one beginning July 2019, another beginning August 2019) in the groundwater elevations were in response to two significant summer rainfall events. These increases were then followed by decreasing trends and then two increasing trend events in October 2019, which mimic the Etowah River levels in response to rain events and dry conditions (lack of rainfall). Within Cells 9 & 10, monitoring wells GWA-41R and GWA-41 show the most noticeable reaction to rainfall and Etowah River hydrograph activity observed on four rain events. Some of this hydrograph response may be attributable to the fluctuations in water levels in the nearby General Service Water Pond. Groundwater in both the overburden and bedrock aquifers responded to rainfall events; however, the time to peak groundwater elevations varied between wells. During this monitoring period, the potentiometric surface of the bedrock aquifer remained above the top of competent bedrock in the instrumented monitoring wells. This higher hydrostatic pressure of the bedrock aquifer limits removal of material from the overburden that could result in subsidence issues. The observed variations in groundwater elevations are attributed to rainfall variations, or due to sampling or maintenance activities at the monitoring points. A comparison of river stage and precipitation data with recorded groundwater elevations (Figures 1A through 3B) shows that both sets of data follow similar overall patterns.

Conclusions and Recommendations

Observed disruptions in the transducer water level were found to be directly attributed to drawdown during sampling events, water level gauging, maintenance of wells, transducers, or

telemetry units, or significant rainfall events. The May 1, 2019 to October 31, 2019 hydrologic monitoring data did not show water level fluctuations attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation. Based on data for the current reporting period (May 1, 2019 and October 31, 2019), Wood recommends the following actions:

- Periodically calibrate elevations to correct for transducer elevation drift.
- Perform the necessary maintenance or replacement of non-functioning transducer equipment in wells to restore function and continue with routine transducer/telemetry system maintenance to ensure that future data are consistent.
- Manually download data, monthly, when a telemetry unit is offline (i.e. not transmitting data to the remote database). This will ensure that data are being reviewed on a consistent and timely basis.
- Trim tree branches as necessary to allow more sunlight to reach the solar panels and charge batteries.
- Field check equipment to make certain insect infestation is not damaging equipment.

Amec Foster Wheeler Project 6122-09-0287**

Dear Mr. Hamilton:

Amec Foster Wheeler Environment & Infrastructure, Inc. is pleased to submit the attached Alternate Source Demonstration for the Plant Bowen - Solid Waste Disposal Facility Landfill Cells 3 & 4 in Cartersville, Georgia. The enclosed report is for your submittal to the Georgia Environmental Protection Division. This report was prepared in accordance with 391-3-4.14.23c of the Georgia Solid Waste Management Rules

We appreciate the opportunity to provide environmental consulting services to the Georgia Power Company and Southern Company Services. Please feel free to contact us at (770) 421-3400 if you have questions or require additional information.

Sincerely,

Amec Foster Wheeler Environment & Infrastructure, Inc.

Professional Ground Water Scientist Certification

I certify that I am a qualified ground-water scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering, and have sufficient training and experience in ground-water hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enable me to make sound professional judgments regarding ground-water monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared in accordance with 391-3-4.14.23c of the Georgia Solid Waste Management Rules to support the position that statistically significant increases (SSIs) are a result of the natural variability in groundwater quality and not a release from the landfill cells.

Georgia Power Company's (GPC) Plant Bowen solid waste disposal facility is located in south Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville and 20 miles southeast of Rome. The disposal facility is approximately 300 acres located on a previously undeveloped, contiguous portion of the plant property. Plant Bowen has four coal burning units equipped with flue gas desulfurization (FGD) technology. The disposal facility (**Figure 1: Plant Bowen Solid Waste Disposal Facilities Monitoring Well Network March 2017**) receives coal combustion by-products, coal ash and gypsum, from coal-burning and FGD processes at the site.

The Plant Bowen solid waste disposal facility is operated in accordance with Georgia Environmental Protection Division's (EPD) Permit No. 008-018D (LI). Groundwater monitoring is conducted as per the permit requirements specified in the Design and Operation (D&O) plan. This includes semi-annual groundwater sampling and continuous groundwater level measurements at the site. In addition, background sampling for the U.S. Environmental Protection Agency's (USEPA) Coal Combustion Residuals (CCR) Rule has been conducted from February 2016 through June 2017.

In March and April 2017, the first semi-annual groundwater monitoring event for 2017 was conducted in accordance with the solid waste permit monitoring requirements. Antimony was detected in Cells 3 & 4 downgradient bedrock monitoring wells GWC-16R and GWC-21R at concentrations of 0.0187 and 0.0058 mg/L, respectively. These concentrations indicated an initial statistically significant increase (SSI) above the interwell prediction limit, constructed from upgradient bedrock wells at Cells 3 & 4, of 0.0046 mg/L. The prediction limit for antimony at Cells 3 & 4 is less than the established maximum contaminant level (MCL) of 0.006 mg/L. Nickel was detected in well GWC-16R at a concentration of 0.0111 mg/L, resulting in an initial SSI which was slightly above the interwell prediction limit of 0.01 mg/L constructed from upgradient bedrock wells at Cells 3 & 4. The prediction limit for nickel at Cells 3 & 4 is less than the established MCL of 0.1 mg/L.

2.0 ALTERNATE SOURCE DEMONSTRATION

The ASD is presented in two parts. The first part is an evaluation of whether or not the antimony and nickel concentrations are an indication of a release from Cells 3 & 4. The second part is an evaluation of other sources, besides Cells 3 & 4, that are contributing to the antimony and nickel concentration above their respective interwell prediction limits.

2.1 Evaluation of a Metals Impact

Per the Georgia Solid Waste Management Rules, to evaluate if the detection(s) of naturally-occurring metals in groundwater downgradient of a disposal unit are an indication of a release, concentrations are compared to statistically-derived levels based on concentrations from background or upgradient wells. A statistically significant increase (SSI) over background levels is not the exclusive criteria for determining a metals impact to groundwater downgradient of a landfill cell. Other factors need to be evaluated to discern if there is evidence of an impact from the landfill cell. A review of the GWC-16R and GWC-21R data indicates the following:

- Construction of disposal Cells 3 & 4 was completed in February 2015 and includes a liner system to prevent waste materials from leaching into underlying groundwater.
- An impact from a landfill cell would typically be expected to result in SSIs of multiple metals concentrations. In March 2017 only antimony and nickel concentrations in wells GWC-16R (antimony and nickel) and GWC-21R (antimony) were above background levels. No other metals concentrations were above background levels in these two wells or in other Cells 3 & 4 downgradient wells, see **Table 1: Analytical Data Summary – Cells 3 & 4 (March 2017)**. All other target metals are present at low concentrations, most of which are present at concentrations below the analytical reporting limit.
- The placement of waste in Cells 3 & 4 began February 2015 and continues to the present. Because the size of the source is increasing over time, which would add more constituents to the groundwater, concentration trends would be expected to increase accordingly if the release was from the landfill cells. As indicated on **Figure 2: Antimony and Nickel Trends in Wells GWC-16R and GWC-21R**, the antimony concentration in GWC-16R is variable over time and does not show an increasing trend indicative of a release. Nickel was detected in GWC-16R and upgradient wells GWA-36R, GWA-37, and GWA-38 prior to waste placement. The nickel concentration in well GWC-16R has decreased since the placement of waste began, thus indicating that the waste is not the source and that there is not an on-going release. The well GWC-21R antimony concentrations also do not show an increasing trend. A comparison of the patterns of concentration trends do not show a correlation between the two metals (nickel decreasing while antimony varies up and down) nor is there consistency of patterns between the two wells as would be expected if the waste cell was the source (**Figure 2**).
- **Figure 3 Comparison of Antimony in Downgradient Wells Screened in the Same Interval as Wells GWC-16R and GWC-21R** shows the antimony concentration time-trends of Cells 3 & 4 downgradient wells (GWC-16R, GWC-21R, GWC-17R, GWC-18, GWC-20R, GWC-23R, and GWC-24R) which are screened across similar elevations (652 to 631 feet, msl). Well GWC-21R is located over 1100 feet to the east of GWC-16R, as shown on **Figure 1** the wells are located on opposite corners of the Cell 3 & 4 area. Well GWC-17R is located about 230 feet east of GWC-16R and well GWC-20R is located about

260 feet west of well GWC-21R. If there had been an antimony impact from the waste placed in Cells 3 & 4, antimony would be expected to be detected at a similar frequency in the adjacent wells GWC-17R and GWC-20R (which were mostly non-detect for antimony over time) as is reported in wells GWC-16R and GWC-21R. As shown on **Figure 3** the GWC-17R and GWC-20R trends do not have the same pattern as GWC-16R and GWC-21R.

The above lines of evidences, namely, (1) a lined landfill designed to limit leaching, (2) a lack of other metals showing SSI, (3) an inconsistent pattern of the detection between antimony and nickel, and (4) an inconsistent detection pattern with other metals to the detection of antimony and nickel do not indicate a release of antimony and nickel to the groundwater downgradient from Cells 3 & 4. Rather, the initial SSIs of antimony and nickel in wells GWC-16R and GWC-21R likely reflect naturally-occurring sources in the geological formation and natural variability of groundwater chemistry underlying the site.

*MCL – Georgia Primary Maximum Contaminant Limit (MCL) for drinking water.

** Georgia Secondary MCL for drinking water. *** U.S. USEPA Action Level for lead. ^ For copper, the action level is 1.3 mg/L. J – Estimated concentration between Method Detection Limit and Practical Quantitation Limit. N/R – does not have a Primary or Secondary MCL. Bold and shaded cells indicate MCL exceedance. Double boxed cells indicate concentration above interwell prediction limit.

2.2 Other Naturally-Occurring Sources of Antimony and Nickel

2.2.1 Natural Occurrence

Antimony and nickel occur naturally in the local geologic formations. The Cartersville mining district in Bartow County contains residual deposits of arsenic-bearing minerals, barite, manganese, and iron oxide minerals along with metal sulfides (Geology and Mineral Deposits of the Cartersville District Georgia, U.S. Geological Survey Professional Paper 224, Kesler, T.L. 1950). Arsenic, copper, lead, nickel, and zinc are found in varying amounts throughout the residual clays of the region due to the weathering of sulfides (Kesler, 1950). The overlying residual clays of the regional carbonate rocks contain deposits of coarsely crystalline barite (Kesler, 1950). The barite encloses sulfides such as enargite, tennantite, chalcocite, chalcopyrite, galena, cerussite, and sphalerite. Enargite often contains traces of antimony, and tennantite (copper-arsenic sulfide) forms a series with the much more common mineral tetrahedrite, which is a copper-antimony sulfide. Tennantite and tetrahedrite share the same crystal structure, but differ in the percentage of arsenic versus antimony (Anthony, Bideaux, Bladh, Nichols. 1990. Handbook of Mineralogy, Vol. I, Elements, Sulfides, Sulfosalts. Mineral Data Publishing). Limestones and dolomites can have antimony concentrations of 0.3 parts per million (Trace Elements in Soils and Plants, 3rd Edition, Table 119, Alina Kabata-Pendias, CRC Press, 2001), which could result in naturally occurring concentrations in groundwater at levels similar to those observed at the site.

2.2.2 Comparison to Upgradient Concentrations

Antimony and nickel have been detected in both upgradient and downgradient wells around Cells 1 & 2, 3 & 4, and 9 & 10 and the two metals are naturally occurring in the minerals present in the area. **Table 2: Antimony Concentrations** below summarizes the antimony concentrations from 2007 to June 2017 from wells in Cells 3 & 4 and other upgradient wells. Upgradient wells GWA-1 and GWA-2R had antimony detected at concentrations of 0.017 and 0.011 mg/L, respectively, and similar to well GWC-16R March 2017 concentration of 0.0187 mg/L.

Table 2: Antimony Concentrations

Antimony in Wells GWC-16R and GWC-21R	Antimony in Cells 3 & 4 Wells (2014 to June 2017)	Antimony in Upgradient Wells Cells 1&2, 3&4, and 9&10 (2007 to June 2017)	Highest Antimony in Upgradient Wells GWA-1, GWA-2R, and GWA-3
GWC-16R March 2017 SSI: 0.0187	0.0002 to 0.0271 mg/L	0.0002 to 0.017 mg/L	0.017, 0.011, and 0.0068 mg/L
Concentrations 2014 to June 2017: <0.005 to 0.0187	Overburden Background: 0.0004 to 0.0052 mg/L		
GWC-21R March 2017 SSI: 0.0058	Bedrock Background: 0.0002 to 0.0046 mg/L		
Concentrations 2014 to June 2017: <0.005 to 0.0058			

Figure 4 Box Plot for Antimony, Total shows that the antimony concentrations in well GWC-16R fall within the antimony concentrations reported in upgradient wells across the landfill area, with the exception being the March 2017 concentration. However, the March 2017 concentration is very close to the concentration in upgradient well GWA-1, which is indicative of natural variability in groundwater quality. Additionally, it is thought that the best estimate of the true value of antimony in GWC-16R is the average value for all the results for the well, which is 0.0054 mg/L. This value is well below the highest detected background antimony value of 0.017 mg/L. The 0.018 mg/L antimony detection in GWC-16R, which resulted in the SSI, was not confirmed by later sampling (0.0097 mg/L in May 2017) and does not appear to be representative of on-going conditions at the well.

Table 3: Nickel Concentrations below summarizes the nickel concentrations from 2007 to March 2017 from wells in Cells 3 & 4, wells across the landfill area, and upgradient wells. Upgradient wells GWA-1, GWA-2R, and GWA-3 had nickel detected at concentrations of 0.054 to 0.14 mg/L. In March 2017 the Cells 3 & 4 overburden and bedrock upgradient wells' nickel concentrations ranged from 0.0005 to 0.0142 mg/L. The GWC-16R nickel concentration of 0.0111 mg/L, which was slightly above the Cell 3 & 4 bedrock interwell prediction limit of 0.01 mg/L, is within the range of site-wide background overburden and bedrock well concentrations observed over time.

Table 3: Nickel Concentrations

Nickel in Wells GWC-16R and GWC-21R	Nickel in Cells 3 & 4 Wells (2014 to March 2017)	Nickel in Upgradient Wells Cells 1&2, 3&4, and 9&10 (2007 to March 2017)	Highest Nickel in Upgradient Wells GWA-1, GWA-2R, and GWA-3
GWC-16R March 2017 SSI: 0.0111 Concentrations 2014 to March 2017: 0.0111 to 0.03	0.0003 to 0.03 mg/L March 2017 Upgradient Wells	0.0004 to 0.14 mg/L	0.14, 0.11, and 0.054 mg/L
GWC-21R March 2016: 0.0017 J (not a SSI) Concentrations 2014 to March 2017: <0.0025 to 0.0261	(Overburden and Bedrock) 0.0005 to 0.0142 mg/L		

2.2.3 Temporal Concentration Variability

An evaluation of nickel and antimony concentrations over time; particularly the detection of these metals in both upgradient and downgradient wells prior to waste placement is further evidence of the natural variability in the groundwater.

As shown on **Figure 2**, nickel was being detected in wells GWC-16R and GWC-21R starting in September 2014 when background monitoring for the solid waste permit began and approximately five months before the initial placement of waste in Cells 3 & 4 in February 2015. Nickel was also detected in the upgradient wells GWA-36R, GWA-37, GWA-38 starting in

September 2014 when monitoring began. The detection of nickel in upgradient and downgradient wells prior to waste placement indicates the nickel was present in the groundwater naturally. Antimony was sampled and analyzed starting in September 2014 also. The first detection of antimony was in March 2016 in upgradient wells (GWA-37, GWA-53, GWA-53R, GWA-55, and GWA-56) and in wells GWC-16R and GWC-21R and other Cells 3 & 4 monitoring wells (GWC-18, GWC-23R, GWC-24R, GWC-25R). Prior to March 2016 antimony was not detected in the upgradient nor the downgradient wells. The simultaneous detection of antimony in upgradient and downgradient Cells 3 & 4 wells starting in March 2016 would indicate that antimony is also naturally present in the groundwater.

2.2.4 Alternative Statistical Evaluation

A statistical evaluation using ProUCL (Appendix A) of all of the antimony data (2007 to June 2017) from all of the upgradient monitoring wells across the landfill area yields an upper simultaneous limit (USL) of 0.039 mg/L. An USL is a number defined as the upper boundary of the largest value in the background data set and that no true background sample (current or future) would exceed with 95% certainty (USL95). The USL is a conservative estimate of the background threshold value especially when the sample size exceeds 20 (the Bowen landfill background data set is 436 samples with 108 detects and 328 non-detects). The SSI antimony results of GWC-16R and GWC-21R (0.0187 and 0.0058 mg/L, respectively) are below the USL-background threshold value (0.039 mg/L).

For this demonstration, combining upgradient wells across each of the cells provides a better representation of constituent concentrations as well as demonstrates the natural background variability in groundwater quality.

2.3 Conclusion and Recommendations

- Antimony and nickel SSIs are not the result of a release from Cells 3 & 4, but are likely the result of natural variability in groundwater quality that is not properly accommodated by the existing statistical method.
- We will likely be moving to intrawell methods, or at least a mix of both interwell and intrawell. A statistician is evaluating the data now and will make a recommendation for future statistical methods.
- In the future, GPC anticipates submitting a request to modify the existing statistical approach for the CCR permit, which will be based on the characteristics of groundwater quality upgradient of the facility.
- Based on the lines of evidences presented in this demonstration report, this site will remain in detection monitoring.

132	95% USL					0.017	95% KM Chebyshev UPL					0.00911
133												
134	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
135	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
136	and consists of observations collected from clean unimpacted locations.											
137	The use of USL tends to provide a balance between false positives and false negatives provided the data											
138	represents a background data set and when many onsite observations need to be compared with the BTV.

**RE: Alternate Source Demonstration
Plant Bowen - Solid Waste Disposal Facility Landfill Cells 1 & 2, 3 & 4, and 9 & 10
Amec Foster Wheeler Project 6122-09-0287**

Dear Ms. Wild:

Wood Environment & Infrastructure Solutions, Inc. is pleased to submit the attached Alternate Source Demonstration for the Plant Bowen - Solid Waste Disposal Facility Landfill Cells 1 & 2, 3 & 4, and 9 & 10 in Cartersville, Georgia. The enclosed report is for your submittal to the Georgia Environmental Protection Division. This report was prepared in accordance with 391-3-4.14.23c of the Georgia Solid Waste Management Rules

We appreciate the opportunity to provide environmental consulting services to the Georgia Power Company and Southern Company Services. Please feel free to contact us at (770) 421-3400 if you have questions or require additional information.

Sincerely,

Wood Environment & Infrastructure Solutions, Inc.

Rhonda N. Quinn, P.G.
Senior Geologist

PROFESSIONAL GROUND WATER SCIENTIST CERTIFICATION

I certify that I am a qualified ground-water scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering, and have sufficient training and experience in ground-water hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enable me to make sound professional judgments regarding ground-water monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared in accordance with 391-3-4.14.23(c) of the Georgia Solid Waste Management Rules to support the position that statistically significant increases (SSIs) in constituent concentrations over background as presented in the 2017 Second Semi-Annual Groundwater Monitoring Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated March 2, 2018.

This document satisfies the requirements of 391-3-4.14.23(c) which allows an owner or operator to demonstrate that a source other than the Landfill Cell has caused an SSI and that the apparent SSI was the result of an alternate source or resulted from errors in “sampling, analysis, statistical evaluation, or natural variation in groundwater quality”.

This report demonstrates that the reported SSIs do not indicate a release from the Landfill Cells, but rather reflect natural variation in groundwater quality.

1.1 Background

The Georgia Power Company (GPC) Plant Bowen solid waste disposal facility is located in south Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville and 20 miles southeast of Rome. The disposal facility is approximately 300 acres located on a previously undeveloped, contiguous portion of the plant property. The disposal facility (**Figure 1: Monitoring Well Network September 2017**) receives coal combustion by-products, coal ash and gypsum, from coal-burning and Flue Gas Desulfurization processes at the site.

The Plant Bowen solid waste disposal facility is operated in accordance with Georgia Environmental Protection Division (EPD) Permit No. 008-018D (LI). Groundwater monitoring is conducted as per the permit requirements specified in the Design and Operation (D&O) Plan. This includes semi-annual groundwater sampling and continuous groundwater level measurements at the site. In addition, background sampling for the U.S. Environmental Protection Agency’s (USEPA) Coal Combustion Residuals (CCR) Rule has been conducted from February 2016 through June 2017.

In September-October 2017, the second semi-annual groundwater monitoring event for 2017 was conducted in accordance with the D&O Plan. Barium, zinc, pH, calcium, chloride, sulfate, Total Dissolved Solids (TDS) were detected a concentrations outside of their statistical prediction limits in some wells. This report demonstrates that these SSIs do not indicate a release from the lined Landfill Cells, but rather the SSIs reflect natural variation in groundwater quality.

2.0 SUMMARY OF STATISTICAL EXCEEDANCES

As presented in the 2017 Second Semi-Annual Groundwater Monitoring Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10 (March 2018), there were two metals and five CCR Appendix III parameters, as listed below, exhibiting SSIs outside their statistical prediction limits.

- GWC-13RZ Barium and Chloride
- GWC-47 Zinc
- GWC-11R pH
- GWC-15Z pH
- GWC-8RR pH
- GWC-22R pH
- GWC-44 pH
- GWC-45 pH
- GWC-48 pH
- GWC-49Z pH
- GWC-16R Calcium
- GWC-17R Calcium
- GWC-21R Calcium
- GWC-23R Calcium
- GWC-13 Chloride
- GWA-40 Chloride and Sulfate
- GWA-4RZ Sulfate
- GWC-49R Sulfate
- GWA-53 Total Dissolved Solids
- GWA-39Z Total Dissolved Solids

In addition, antimony was detected in bedrock monitoring well GWC-16R downgradient Cells 3 & 4 at a concentration of 0.0078 (seasonality adjusted concentration of 0.01813 mg/L), which was above the seasonality-adjusted interwell prediction limit of 0.01545 mg/L. The statistical exceedance of antimony in GWC-16R has been determined to be the result of the natural variability of groundwater quality, as shown in the Alternate Source Demonstration, dated August 28, 2017. The SSI for antimony in GWC-16R is not addressed in this report.

Additional details regarding the statistical exceedances are summarized on **Table 1: Summary of Statistical Exceedances**.

3.0 ALTERNATE SOURCE DEMONSTRATION

Georgia Solid Waste Management Rule 391-3-4.14.23(c) allows the owner to demonstrate that a source other than the Landfill Cells caused the SSI or that the apparent statistical exceedance resulted from error in sampling, analysis, statistical evaluation, or from natural variation in groundwater quality. Pursuant to 391-3-4.14.23(c), the following is provided as a demonstration that the listed SSIs are due to natural variation in groundwater chemistry and is not a release from the disposal units.

3.1 General Evaluation of the Statistical Exceedances

Barium and zinc in two wells exceeded their statistical prediction limits (excluding antimony in well GWC-16R). Five of the seven Appendix III parameters (calcium, chloride, pH, sulfate, and TDS) were sporadically detected in several wells at concentrations above their statistical prediction limits. Boron and fluoride (Appendix III) concentrations did not exceed statistical prediction limits. **Tables 2, 3, and 4: Evaluation of Statistical Exceedances for Landfill Cells 1 & 2, 3 & 4, and 9 & 10** show which wells and parameters exhibit a statistical exceedance on a grid format. The purpose of the tables is to present a comprehensive snapshot of all of the data for each subject Landfill Cell. The table for each Landfill Cell shows a red square where there is a statistical exceedance; and as indicated on **Tables 2, 3, and 4** the red squares are scattered across each of the Landfill Cells. The tables highlight the following line of information that demonstrates that the SSIs are the result of natural variability in groundwater quality and not a release from the Landfill Cells.

If a release were present, the data would exhibit multiple exceedances for more than one well within each Landfill Cell. Each downgradient compliance well exhibiting an SSI only had an exceedance for a single parameter, except for downgradient well GWC-13RZ and upgradient background well GWA-40, which had SSIs for two parameters. Review of the SSIs presented on the tables does not show a grouping of exceedances, as would be expected from a release, they show a scattered distribution, which is not an indication of a release from the Landfill Cells.

In March 2018, as part of the 2018 1st semi-annual sampling event, additional parameters, namely, magnesium, sodium, potassium, and alkalinity were analyzed from the Landfill Cells upgradient wells and from the downgradient wells with statistical exceedances. The geochemical data was used to evaluate if the upgradient (background) and downgradient groundwater had consistent chemical characteristics and if the background wells were geochemically representative of downgradient wells. The data is summarized on **Table 5: Summary of Geochemical Data**. The table is color-coded to show similarities and differences. The colors depict a ranking of the concentrations from highest to lowest along a column for a single parameter. The highest concentrations are shown in dark red and the lowest concentration are shown in dark green with the concentrations between the highest and lowest shown in yellow. Lighter shadings of red, green, and yellow indicate the next highest or next lowest concentration. **Table 5** highlights the following.

- The majority of wells indicate a calcium-bicarbonate type groundwater across the three Landfill Cells; a few wells show sodium-bicarbonate or magnesium-bicarbonate type water; two wells show calcium-sulfate type groundwater and one well shows sodium-chloride type groundwater.
- There are differences in groundwater composition between upgradient and downgradient groundwater, particularly at Cells 3 & 4 and Cells 9 & 10, due to variable lithology and groundwater flow.

As indicated on **Table 5**, there are some geochemical differences between the upgradient and downgradient wells that contributes to the natural variation in the groundwater quality. The current statistical methods do not take geochemical differences into account and may not explain the natural variability for applicable parameters. As additional data are collected semi-annually, the working assumptions and statistical approach currently used may periodically be re-evaluated, and the statistical methods adjusted as necessary.

3.2 Barium at GWC-13RZ

The SSI of barium at GWC-13RZ is likely the result of natural variation in groundwater quality and not the result of a release from the disposal unit. The following information supports this conclusion.

- Barium concentrations in well GWC-13RZ are similar to barium concentrations at this location before placement of waste in Cells 1 & 2.

Current barium concentration (0.082 mg/L) in GWC-13RZ is within the range of barium concentrations (0.0055 to 0.45 mg/L) detected prior to waste placement, as shown in the table below. Bedrock well GWC-13RZ replaced bedrock well GWC-13R, due to elevated pH from potential leakage of grout that was used to seal the borehole. The new bedrock well was installed about five feet deeper than GWC-13R and the GWC-13RZ screened interval overlapped with the GWC-13R screened interval. Barium concentrations in both old well GWC-13R and new well GWC-13R are within the range of barium levels measured prior to waste placement in Cells 1 & 2.

- Barium concentrations in well GWC-13RZ are within the range of background concentrations at other Landfill Cells, and are similar to barium in other Cells 1 & 2 wells.

Barium concentrations in well GWC-13RZ are comparable to barium levels in the upgradient wells at other Landfill Cells onsite, as show in the table below.

Barium Concentrations in Well GWC-13RZ	Barium Concentrations Prior to Waste Placement in Cells 1 & 2 (November 2008)	Barium Concentrations in Sitewide Background Wells 2007 to October 2017	Barium Concentrations in Cells 1 & 2 Background and Downgradient Wells 2007 to October 2017
GWC-13RZ October 2017: 0.0699 mg/L December 2017: 0.082 mg/L	GWC-13R prior to waste placement (August 2007 to May 2008): 0.0095 to 0.028 mg/L GWC-13R August 2007 to June 2016: 0.0095 to 0.19 mg/L	August 2007 to October 2017: 0.003 to 0.15 mg/L	August 2007 to October 2017: 0.0033 to 0.45 mg/L
GWC-13RZ: February to December 2017: 0.0561 to 0.0932 mg/L	Background wells prior to waste placement (August 2007 to May 2008): 0.0066 to 0.13 mg/L Downgradient wells prior to waste placement (August 2007 to May 2008): 0.0055 to 0.45 mg/L Cells 1 & 2 wells, before waste placement in November 2008: 0.0055 to 0.45 mg/L		

- Absence of other metals in GWC-13RZ having a similar concentration trend as barium.

The target metals (per site D&O Plan) in well GWC-13RZ occur in low concentrations at the site with only barium showing consistently detectable concentrations, but at levels significantly below the Maximum Contaminant Level (MCL) of 2 mg/L. Well GWC-13RZ has been analyzed 8 times for barium and 7 times for antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, mercury, selenium, and thallium. Of these metals only barium had positive detections above the laboratory practical quantitation limit (PQL). Other constituents were below the PQL or present in low concentrations. The metals (antimony, arsenic, and selenium) with more than two detections out of the seven results are graphed on **Figure 2: GWC-13RZ Metals Data**. If there had been a groundwater impact from the waste placed in Cells 1 & 2, barium and other metals would show a similar detection pattern and increasing concentration trend. A comparison of the patterns of concentration trends for the three other metals in well GWC-13RZ do not show a correlation between barium and the other three metals, and there are no increasing trends.

- Barium occurs naturally in minerals beneath the site.

Barium occurs naturally in the local geologic formations. The Cartersville mining district in Bartow County contains residual deposits of arsenic-bearing minerals, barite, manganese, and iron oxide minerals along with metal sulfides (Geology and Mineral Deposits of the Cartersville District Georgia, U.S. Geological Survey Professional Paper 224, Kesler, T.L. 1950). Arsenic, barium, copper, lead, nickel, and zinc are found in varying amounts throughout the residual clays of the region due to the weathering of sulfides (Kesler, 1950). The overlying residual clays of the regional carbonate rocks contain deposits of coarsely crystalline barite (Kesler, 1950). The barite (barium sulfate) encloses sulfides such as enargite, tennantite, chalcocite, chalcopyrite, galena, cerussite, and sphalerite. Enargite often contains traces of antimony, and tennantite (copper-arsenic sulfide) forms a series with the much more common mineral tetrahedrite, which is a copper-antimony sulfide. Tennantite and tetrahedrite share the same crystal structure but differ in the percentage of arsenic versus antimony (Anthony et al., 1990). Limestones and dolomites can have barium concentrations of 50 to 200 parts per million (Trace Elements in Soils and Plants, 3rd Edition, Table 119, Alina Kabata-Pendias, CRC Press, 2001), which could result in naturally occurring concentrations in groundwater at levels similar to those observed at the site.

3.3 Zinc at GWC-47

The SSI of zinc at GWC-47 is likely the result of natural variation in groundwater quality and not the result of a release from the disposal unit. The following information supports this conclusion.

- Zinc concentrations in overburden well GWC-47 are similar to zinc concentrations before placement of waste in Cells 9 & 10.

The initial waste placement began in November 2015 for Cells 9 & 10. Current zinc concentration (0.0315 mg/L) in well GWC-47 is within the range of zinc concentrations (0.003 to 0.31 mg/L) detected in overburden well GWC-45 prior to waste placement, as shown in the table below.

- Zinc concentrations in well GWC-47 are within the range of background concentrations at other Landfill Cells, and are similar to zinc in other Cells 9 & 10 wells.

Zinc concentrations in well GWC-47 are comparable to zinc levels in the upgradient wells at other Landfill Cells onsite, as show in the table below.

Zinc Concentrations in Well GWC-47	Zinc Concentrations Prior to Waste Placement in Cells 9 & 10 (November 2015)	Zinc Concentrations in Sitewide Background Wells 2016 to October 2017	Zinc Concentrations in Cells 9 & 10 Background and Downgradient Wells 2016 to October 2017
GWC-47 October 2017: 0.0196 mg/L December 2017: 0.0315 mg/L	GWC-45 prior to waste placement (May 2007 to May 2015): 0.003 to 0.31 mg/L GWC-45R (May 2007 to May 2015): 0.0027 to 0.017 mg/L	March 2016 to October 2017: 0.0012 to 0.406 mg/L Cells 9 & 10 Background March 2016 to October 2017 0.0012 to 0.0162 mg/L	March 2016 to October 2017 0.0012 to 0.0315 mg/L
GWC-47: 2016 to December 2017: 0.0156 to 0.0315 mg/L			

- Absence of other metals in GWC-47 having a similar trend as zinc.

The target metals (per site D&O Plan) in well GWC-47 occur in low concentrations at the site with only barium and zinc showing consistently detectable concentrations, but at levels significantly below the primary MCL of 2 mg/L for barium and secondary MCL of 5 mg/L for zinc. Well GWC-47 has been analyzed nine times for zinc and nine times for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, mercury, selenium, and thallium. Copper, nickel, silver, and vanadium have been analyzed eight times. Of these metals only barium and zinc had positive detections above the laboratory PQL. Other constituents were below the PQL or present in low concentrations. The metals (barium, chromium, and zinc) with more than three detections out of the eight to nine results were graphed on **Figure 3: GWC-47 Metals Data**. If there had been a groundwater impact from the waste placed in Cells 9 & 10, zinc and other metals would show a similar pattern and an increasing concentration trend. A comparison of the patterns of concentration trends in well GWC-47 do not show a correlation between zinc and the other two metals and most of the analyzed metals have less than three detections out of eight to nine analyses. There is not an indication of increasing concentration trends in the metals detected in GWC-47. Also, the zinc detection pattern in background overburden well GWA-42 is similar to downgradient overburden well GWC-47 as shown on **Figure 3**.

- Zinc is present in naturally occurring minerals beneath the site.

The Cartersville mining district in Bartow County contains residual deposits of arsenic-bearing minerals, barite, manganese, and iron oxide minerals along with metal sulfides (Geology and Mineral Deposits of the Cartersville District Georgia, U.S. Geological Survey Professional Paper 224, Kesler, T.L. 1950). Arsenic, barium, copper, lead, nickel, and zinc are found in varying amounts throughout the residual clays of the region due to the weathering of sulfides (Kesler, 1950). Zinc chiefly occurs as a sulfide mineral. Limestones and dolomites can have zinc concentrations of 10 to 25 parts per million (Trace Elements in Soils and Plants, 3rd Edition, Table 119, Alina Kabata-Pendias, CRC Press, 2001), which could result in naturally occurring concentrations in groundwater at levels similar to those observed at the site.

3.4 pH at GWC-8RR, GWC-11R, GWC-15Z, GWC-22R, GWC-44, GWC-45, GWC-48, and GWC-49Z

The statistical exceedances of pH values in wells GWC-8RR, GWC-11R, GWC-15Z, GWC-22R, GWC-44, GWC-45, GWC-48, and GWC-49Z are likely the result of natural variation in groundwater quality and not the result of a release from the disposal units. The following information supporting this conclusion include.

- Landfill Cells 1 & 2, Cells 3 & 4, and Cells 9 & 10 were constructed with liner systems to prevent waste materials from leaching into underlying groundwater.
- The wells with pH statistical excursions are within the range of pH values (4.33 to 10.61 standard units (su)) for all wells during the background monitoring events and are similar to pH ranges prior to waste placement in the cells (see table below).
- At Cells 1 & 2, the pH values for GWC-15Z, GWC-8RR, and GWC-11R are within the range of 4.92 to 10.61 su noted for all downgradient wells. **Figure 4: Trends in pH for GWC-11R, GWC-8RR and GWC-15Z** shows that wells GWC-15Z, GWC-8RR, and GWC-11R have a narrow range of fluctuation in pH values which reflect natural variation in groundwater pH due to variable recharge events.
- At Cells 3 & 4, the pH values in the downgradient wells range from 6.0 to 7.87 su, while upgradient wells range from 4.94 to 8.34 su. GWC-22R pH values are within these ranges.
- United States Geological Survey data from water supply wells in the Cartersville, Georgia area of the Valley and Ridge Providence have pH values ranging from 6.2 to 8.4 su. The pH values in the Cells 1 & 2 and Cells 3 & 4 wells are similar to the off-site water-supply wells.
- At Cells 9 & 10, the pH values in GWC-44, GWC-45, GWC-48, and GWC-49Z are slightly less than the lower prediction limit based on comparison to upgradient concentrations. However, the values are similar to those present prior to waste placement and similar to the range detected across the site in February 2016. Lower pH can be attributed to rainfall influence on the downgradient groundwater. This is reflected in the geochemical differences between the upgradient and downgradient groundwater at Cells 9 & 10 (**Table 5**). Downgradient wells GWC-44, GWC-45, GWC-48, and GWC-49Z contain very low alkalinity, low TDS, low calcium, and low pH that reflect recent recharge water affecting the groundwater composition. As the residence time of groundwater increases at these locations, groundwater composition is expected to evolve into predominantly calcium-bicarbonate type following water-rock interactions in the carbonate bedrock.

pH SSIs	Predictive Limits	pH Range Prior to Waste Placement	pH Range February 2016 to March 2018 (all wells)	pH Regional Reference Range
Cells 1 & 2 GWC-11R (7.74 su) GWC-15Z (7.74 su) GWC-8RR (7.86 su)	7.65 to 5.23 su	>8.5 to 4.6 su (August 2007 to December 2008)	4.88 to 10.61 su	6.2 to 8.4 su
Cells 3 & 4 GWC-22R (7.39 su)	7.87 to 7.52 su	8.21 to 5.34 su (Aug 2011)	4.94 to 8.34 su	

pH SSIs	Predictive Limits	pH Range Prior to Waste Placement	pH Range February 2016 to March 2018 (all wells)	pH Regional Reference Range
Cells 9 & 10 GWC-44 (4.51 su) GWC-45 (5.08 su) GWC-48 (5.07 su) GWC-49Z (5.51 su)	7.89 to 5.77 su	>8.5 to 4.52 su (Aug 2011)	4.33 to 8.08 su	6.2 to 8.4 su

3.5 Calcium at GWC-16R, GWC-17R, GWC-21R, and GWC-23R

The statistical exceedances of calcium concentrations in wells GWC-16R, GWC-17R, GWC-21R, and GWC-23R are likely the result of natural variation in groundwater quality and not the result of a release from the disposal unit. The following information supporting this conclusion include.

Calcium concentrations in wells GWC-16R, GWC-17R, GWC-21R, and GWC-23R ranged from 58.9 to 67.2 mg/L. These concentrations exceed the interwell prediction limit of 48.7 mg/L for Cells 3 & 4. However, these concentrations are due to differences in aquifer lithologies affecting the groundwater chemistry as shown by site-specific data. Additionally, the calcium concentrations are comparable to regional concentrations of calcium in wells within the Knox Dolomite and Newala Limestone.

Site-specific major ion data collected in March 2018 indicate that aquifer lithologies affect the groundwater geochemistry. The March 2018 geochemical data on **Table 5** shows the upgradient wells have a different geochemical profile than the downgradient wells. Wells GWC-16R, GWC-17R, GWC-21R, and GWC-23R are screened in dolomite, a rock with a high magnesium content. The geochemical data (**Table 5**) indicates the groundwater in these four wells is a combination of calcium bicarbonate and magnesium bicarbonate, which confirms the downgradient groundwater chemistry is characteristic of a dolomite aquifer. The groundwater in the upgradient wells is a combination of calcium bicarbonate and sodium bicarbonate. The upgradient wells are screened in a variety of lithologies ranging from clayey sands, silty sandy clays, lean clay, and dolomite with chert. Groundwater flow through variable lithologies facilitate natural variation in groundwater quality at the site. USGS data from water-supply wells in the Cartersville area of the Valley and Ridge have calcium concentrations up to 58 mg/L (**Appendix A: USGS Regional Data**).

3.6 Chloride at GWC-13, GWC-13RZ, and GWA-40

Reported chloride concentrations in wells GWC-13, GWC-13RZ, and GWA-40 were 6.2 mg/L, 8.9 mg/L, and 2.4 mg/L, respectively. These concentrations exceeded the prediction limits as shown in **Table 1**. The statistical exceedances of chloride at wells GWC-13, GWC-13RZ, and GWA-40 are likely the result of natural variation in groundwater quality and not the result of a release from the Landfill Cells. The following information supporting this conclusion include.

- Well GWA-40 is an upgradient well as demonstrated by groundwater flow direction based on measured water level elevations. The groundwater flow directions have been consistent with historical data from the site. Variations in chloride concentrations reflect natural variations in groundwater quality at the site. Statistical exceedances noted for this upgradient well cannot be attributed to the lined Landfill Cell.

- Chloride exceedances in GWC-13 and GWC-13RZ appear to be affected by recharge effects due its location near a drainage ditch that includes surface runoff from the landfill perimeter roads and adjacent slopes. The chloride concentrations in these wells are relatively low, and comparable to regional concentrations in water supply wells (average 4.5 mg/L in wells screened in Knox Dolomite, USGS Water Supply Paper 1619-FF), and these wells do not show other indicator parameters such as boron and fluoride. For these reasons, chloride concentrations in wells GWC-13 and GWC-13RZ are attributed to natural variations in groundwater quality.

3.7 Sulfate at GWA-4RZ, GWA-40, and GWC-49R

The statistical exceedances of sulfate at wells GWA-4RZ, GWA-40, and GWC-49R are likely the result of natural variation in groundwater quality and not the result of a release from the disposal units. The following information supporting this conclusion include.

- The sulfate statistical exceedances were reported in upgradient wells GWA-4RZ and GWA-40 at 26 mg/L and 7.4 mg/L, respectively. Wells GWA-4RZ and GWA-40 are upgradient wells as demonstrated by groundwater flow direction based on measured water level elevations. The groundwater flow directions have been consistent with historical data from the site. Variations in sulfate concentrations reflect natural variations in groundwater quality at the site. Statistical exceedances noted for these upgradient wells cannot be attributed to the lined landfill cells.
- Sulfate concentrations in Cells 1 & 2 upgradient wells have ranged from 0.5 to 105.552 mg/L, and sulfate concentrations in Cells 9 & 10 upgradient wells have ranged from 0.47 to 26 mg/L, which are within the range sulfate concentrations in bedrock well GWC-49R (3.8 mg/L) downgradient of Cells 9 & 10.
- Intrawell analysis calls for a 1-of-3 resampling strategy to be used when there is a statistical exceedance to verify the initial exceedance. The March 2018 sulfate result in GWC-49R was 3.1 mg/L, which is less than the prediction limit of 3.61 mg/L, thus the statistical exceedance was not verified.

3.8 Total Dissolved Solids at GWA-53 and GWA-39Z

Total Dissolved Solids (TDS) concentrations of 154 mg/L and 107 mg/L, respectively, in wells GWA-53 and GWA-39Z slightly exceed the intrawell prediction limits of 152.9 mg/L and 105.2 mg/L, respectively. Wells GWA-53 and GWA-39Z are upgradient wells as demonstrated by groundwater flow direction based on measured water level elevations. The groundwater flow directions have been consistent with historical data from the site. Variations in TDS concentrations reflect natural variations in groundwater quality at the site. Statistical exceedances noted for these upgradient wells cannot be attributed to the lined Landfill Cells.

4.0 CONCLUSIONS AND RECOMMENDATIONS

This ASD has been prepared in response to apparent SSIs presented in the 2017 Second Semi-Annual Groundwater Monitoring Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated March 2, 2018. Alternate sources were identified for the statistical exceedances for each of the following wells and constituents.

- GWC-13RZ Barium and Chloride
- GWC-47 Zinc
- GWC-11R pH
- GWC-15Z pH
- GWC-8RR pH
- GWC-22R pH
- GWC-44 pH
- GWC-45 pH
- GWC-48 pH
- GWC-49Z pH
- GWC-16R Calcium
- GWC-17R Calcium
- GWC-21R Calcium
- GWC-23R Calcium
- GWC-13 Chloride
- GWA-40 Chloride and Sulfate
- GWA-4RZ Sulfate
- GWC-49R Sulfate
- GWA-53 Total Dissolved Solids
- GWA-39Z Total Dissolved Solids

An ASD for well GWC-16R antimony statistical exceedance was previously submitted in August 28, 2017.

As outlined in Section 3, the statistical exceedances are due to variability in the groundwater quality and are not an indication of a release from the lined Landfill Cells. All locations have met the requirements for a demonstration listed in 391-3-4.14.23(c). Therefore, all locations should remain in CCR detection monitoring at this time. Detection monitoring results and D&O Plan target metals results should continue to be presented in the subsequent semi-annual groundwater monitoring reports.

TABLES

TABLE 1
SUMMARY OF STATISTICAL EXCEEDANCES - Plant Bowen Landfill Cells 1 & 2, 3 & 4, and 9 & 10

Parameter	Landfill Cell	Well	Initial Result	Resampled Result	Prediction Limit	Statistical Method
Barium	Cells 1 & 2	GWC-13RZ	0.0699 mg/L	0.082 mg/L	0.052 mg/L	Interwell
Zinc	Cells 9 & 10	GWC-47	0.0196 mg/L	0.0315 mg/L	0.0162 mg/L	Interwell
pH	Cells 1 & 2	GWC-11R	7.74 su	Not resampled	7.65-5.23 su	Interwell
pH	Cells 1 & 2	GWC-15Z	7.74 su	Not resampled	7.65-5.23 su	Interwell
pH	Cells 1 & 2	GWC-8RR	7.84 su	7.86 su	7.65-5.23 su	Interwell
pH	Cells 3 & 4	GWC-22R	7.46 su	7.39 su	7.87-7.52 su	Intrawell
pH	Cells 9 & 10	GWC-44	4.51 su	Not resampled	7.89-5.77 su	Interwell
pH	Cells 9 & 10	GWC-45	4.92 su	5.08 su	7.89-5.77 su	Interwell
pH	Cells 9 & 10	GWC-48	5.06 su	5.07 su	7.89-5.77 su	Interwell
pH	Cells 9 & 10	GWC-49Z	5.51 su	5.51 su	7.89-5.77 su	Interwell
Calcium	Cells 3 & 4	GWC-16R	63.8 mg/L	Not resampled	48.7 mg/L	Interwell
Calcium	Cells 3 & 4	GWC-17R	67.2 mg/L	Not resampled	48.7 mg/L	Interwell
Calcium	Cells 3 & 4	GWC-21R	58.9 mg/L	Not resampled	48.7 mg/L	Interwell
Calcium	Cells 3 & 4	GWC-23R	61.1 mg/L	Not resampled	48.7 mg/L	Interwell
Chloride	Cells 1 & 2	GWC-13	6.2 mg/L	Not resampled	2.86 mg/L	Interwell
Chloride	Cells 1 & 2	GWC-13RZ	8.9 mg/L	Not resampled	2.86 mg/L	Interwell
Chloride	Cells 9 & 10	GWA-40	2.4 mg/L	3.9 mg/L	1.56 mg/L	Intrawell
Sulfate	Cells 1 & 2	GWA-4RZ	25 mg/L	26 mg/L	22.61 mg/L	Intrawell
Sulfate	Cells 9 & 10	GWA-40	4.2 mg/L	7.4 mg/L	1.66 mg/L	Intrawell
Sulfate	Cells 9 & 10	GWC-49R	4.2 mg/L	3.8 mg/L	3.61 mg/L	Intrawell
TDS	Cells 3 & 4	GWA-53	154 mg/L	Not resampled	152.9 mg/L	Intrawell
TDS	Cells 9 & 10	GWA-39Z	107 mg/L	Not resampled	105.2 mg/L	Intrawell

Notes:

TDS = Total Dissolved Solids

su = pH standard units

mg/L = milligrams per liter

Notes:

- 0 Indicates the parameter concentration did not exceed a statistical prediction limit
- 1 Indicates the parameter concentration was above the statistical prediction limit
- 1 Indicates the initial result of the parameter concentration was above the statistical prediction limit and was later re-sampled
- na parameter was not analyzed

Notes:

UP = Upgradient well (background well)

DOWN = Downgradient well

OB = overburden water unit

ROCK = bedrock water unit

Data shown is from the March 2018 sampling event

The table is color-coded to show similarities and differences. The colors depict a ranking of the concentrations from highest to lowest along a column for a single parameter.

The highest concentrations are shown in dark red and the lowest concentration are shown in dark green with the concentrations between the highest and lowest shown in yellow.

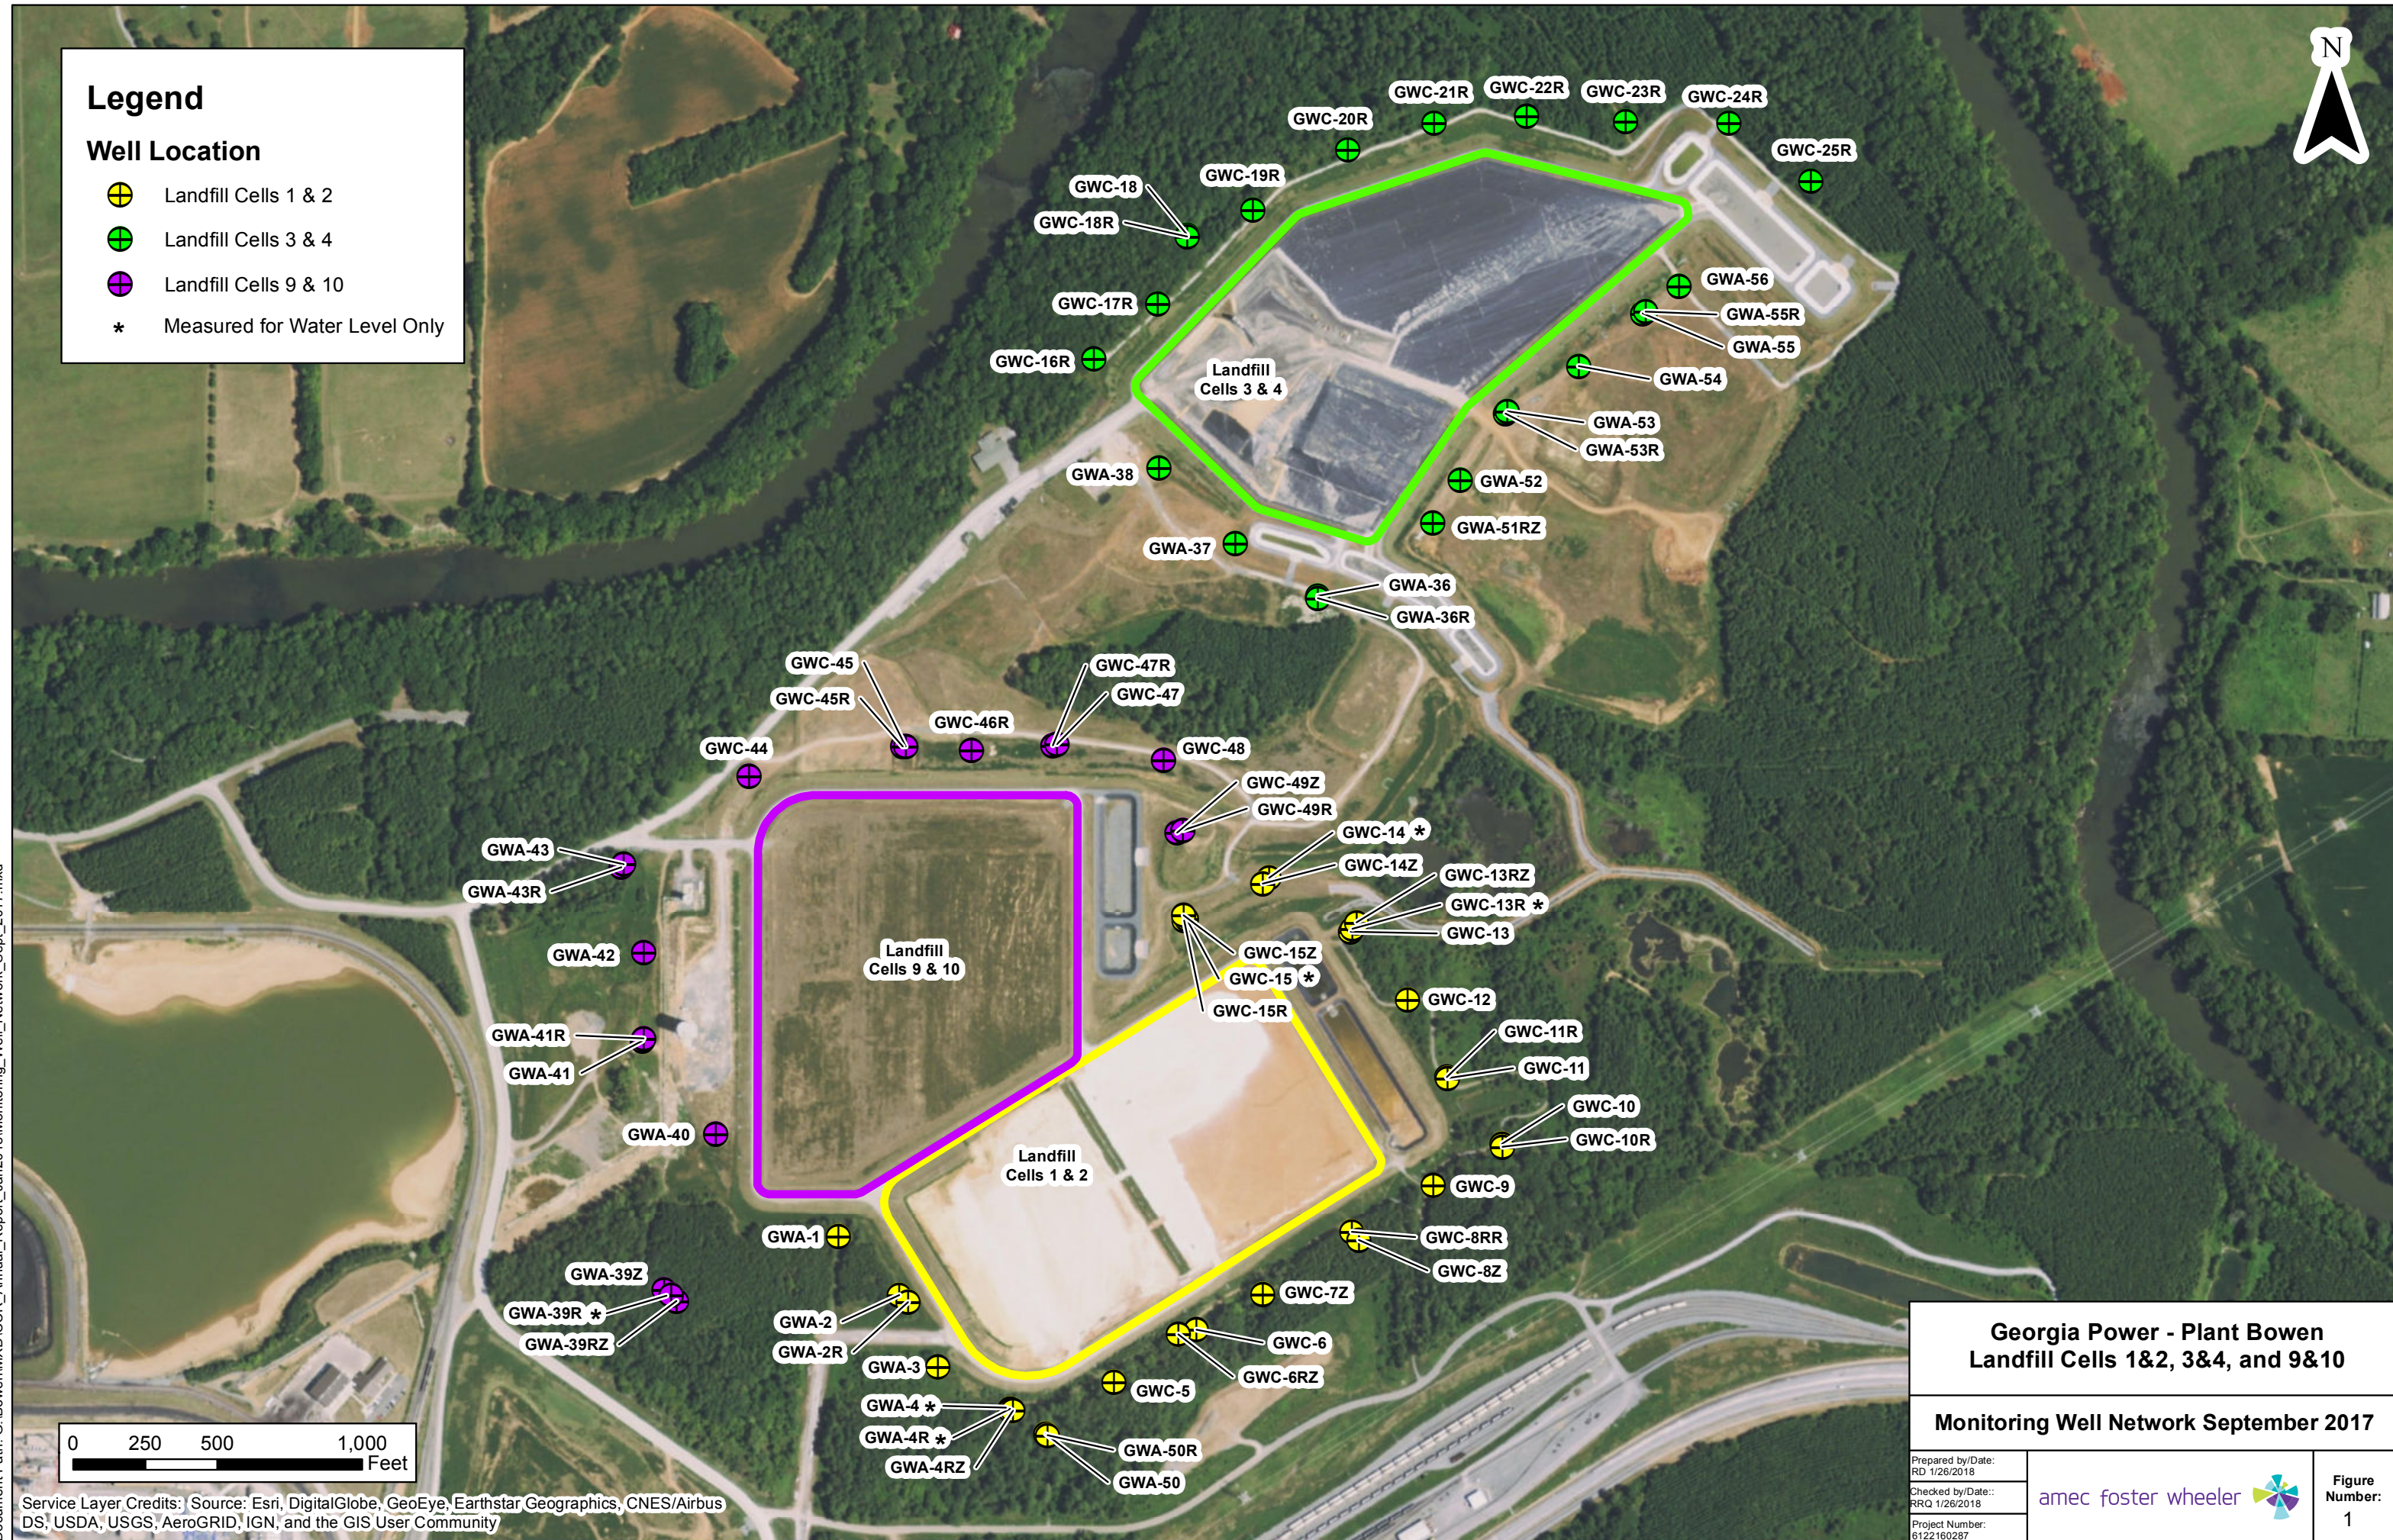

Lighter shadings of red, green, and yellow indicate the next highest or next lowest concentration.

Subject: Groundwater Alternate Source Demonstration
Bartow County – Plant Bowen Industrial Landfill
Permit No. 008-018D(LI)

I have reviewed the groundwater Alternate Source Demonstration submittals that address the following Statistically Significant Increases (SSI's): antimony, barium, zinc, pH, calcium, chloride, sulfate, and total dissolved solids. Based on the information provided by Georgia Power the Alternate Source Demonstration is approved. If you have questions or require further information, please contact me at (404) 362-4511.

Sincerely,

Steve McManus, P.G.
