### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:37 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

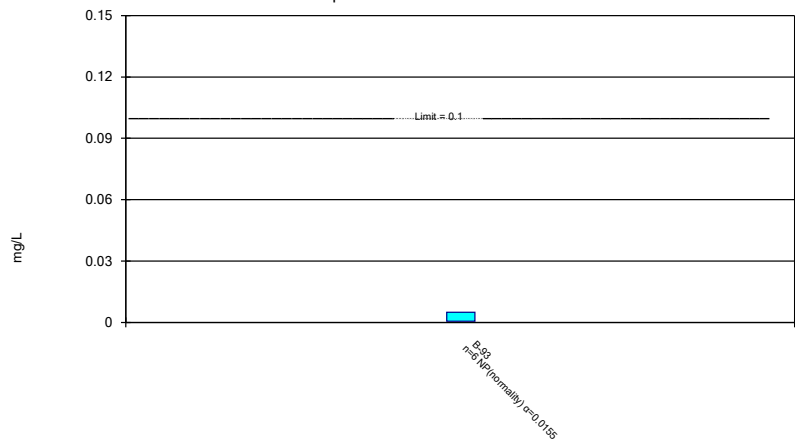

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Chromium Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Int  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Int  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/22/2022 9:38 AM View: AP 234 Confidence Int

# GROUNDWATER STATS CONSULTING

July 31, 2023

Southern Company Services  
Attn: Mr. Joju Abraham  
241 Ralph McGill Blvd NE, Bin 10160  
Atlanta, Georgia 30308-3374

Re: Plant McDonough Ash Pond (AP-2,3,4)  
January/February 2023 Statistical Analysis

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the January/February 2023 Semi-Annual Groundwater Monitoring and Corrective Action Statistical summary of groundwater data for Georgia Power Company's Plant McDonough AP-2,3,4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling for Appendix III parameters began in 2016, and at least 8 background samples were collected at each of the groundwater monitoring wells. Semi-annual sampling of the majority of Appendix IV constituents has been performed for several years in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations. A list of all parameters is provided below.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** DGWA-53, DGWA-70A, DGWA-71
- **Downgradient wells:** DGWC-2, DGWC-4, DGWC-5, DGWC-8, DGWC-9, DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-14, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-42, DGWC-47, and DGWC-48

- **Assessment Wells:** B-56, B-62, B-63, B-66, B-77, B-82, B-83, B-88, B-92, B-93, B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, B-111D, B-120D, and B-122D

The assessment wells were installed at various times during 2016-2020 as follows:

- **2016** - B-56, B-62, B-63, and B-66
- **2019** - B-77, B-82, B-83, B-88, B-92, and B-93
- **2020** – B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, and B-111D
- **2021** – B-120D
- **2022** – B-122D

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The Coal Combustion Residuals (CCR) program consists of the constituents listed below. The terms “parameters” and “constituents” are used interchangeably.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient and assessment well/constituent pairs containing 100% non-detects follows this letter.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the previous screening and demonstrated that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

### **Summary of Statistical Methods – Appendix III Parameters**

Based on the earlier evaluation described above, the following methods were selected:

- Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, pH, sulfate, and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In some cases, earlier data may require deselection prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

## **Summary of Background Screening – Conducted in March 2019**

### Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. In cases where the most recent value was identified as an outlier, values were not flagged in the database as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e., measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Of the outliers identified by Tukey's method, only a few of these values were flagged in the database as all other values are similar to other measurements.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

### Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When

seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

### Trend Test Evaluation

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses were included with the previous screening and showed two statistically significant decreasing trends for the Appendix III parameters. The only trend identified in the upgradient wells was a statistically significant decreasing trend for sulfate in well DGWA-71. All trends noted were relatively low in magnitude when compared to average concentrations; therefore, no adjustments were made to the data sets.

### Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified no variation among upgradient well data for fluoride, making this constituent eligible for interwell analyses. Variation was noted for boron, calcium, chloride, pH, sulfate, and TDS, which would indicate intrawell analyses may be most appropriate

for these parameters. While data were further tested for intrawell eligibility during the screening, interwell methods will be used for all Appendix III constituents in accordance with Georgia EPD requirements.

## **Statistical Analysis of Appendix III Parameters – January/February 2023**

### Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through February 2023 (Figure D). Background (upgradient) well data were re-assessed for potential outliers during this analysis and no new values were flagged. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The January/February 2023 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result. Therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Several prediction limit exceedances were noted for Appendix III parameters. A summary table of the interwell prediction limits follows this letter.

### Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable at the 99% confidence level (Figure E). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells. Similar patterns that are present in both upgradient and downgradient wells are an indication of variability in groundwater quality unrelated to practices at the site. A summary of the trend test results follows this letter. Statistically significant trends were noted for the following well/constituent pairs:

#### Increasing trends

- Boron: DGWC-4, DGWC-11, DGWC-17
- Calcium: DGWC-4, DGWC-5, DGWC-11, DGWC-19, DGWC-21, and DGWC-23
- Chloride: DGWC-5, DGWC-9, DGWC-15, and DGWC-20
- pH: DGWC-2, DGWC-5, and DGWC-19
- Sulfate: DGWC-19
- TDS: DGWC-4, DGWC-5, DGWC-11, and DGWC-19

#### Decreasing trends

- Boron: DGWC-2, DGWC-8, DGWC-9, DGWC-10, DGWC-12, DGWC-13, DGWC-19, DGWC-20, DGWC-47, and DGWC-48
- Calcium: DGWC-9, DGWC-48, and DGWA-53 (upgradient)
- Chloride: DGWC-4, DGWC-19, DGWC-21, DGWC-22, DGWC-23, DGWC-42, and DGWA-53 (upgradient)
- Fluoride: DGWC-47 and DGWC-48
- pH: DGWC-9, DGWC-20, and DGWC-47
- Sulfate: DGWC-2, DGWC-8, DGWC-10, DGWC-12, DGWC-13, DGWC-15, DGWC-20, DGWC-42, DGWC-47, DGWC-48, and DGWA-71 (upgradient)
- TDS: DGWC-10, DGWC-20, DGWC-48, and DGWA-53 (upgradient)

### **Statistical Analysis of Appendix IV Parameters – January/February 2023**

For Appendix IV parameters, confidence intervals for each downgradient and assessment well/constituent pair with four or more samples were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. As mentioned above, downgradient and assessment well/constituent pairs that contain 100% non-detects do not require analysis. Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis prior to constructing statistical limits. No new values were flagged during this analysis and a complete list of flagged outliers follows this report (Figure C).

#### Interwell Upper Tolerance Limits

Interwell upper tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through February 2023 for Appendix IV constituents (Figure F). Parametric tolerance limits are used when data follow a normal or transformed-normal distribution such as for combined radium. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used.

## Groundwater Protection Standards

The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a). On July 30, 2018, US EPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Effective on February 22, 2022, Georgia EPD incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a). In accordance with the updated Rules, the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title
- Where an MCL has not been established for a constituent, Federal and State CCR Rules specify levels for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

Following Georgia EPD Rule requirements and the Federal CCR requirements, GWPS were established for statistical comparison of Appendix IV constituents for this sample event (Figure G).

## Confidence Intervals

To complete the statistical comparison to GWPS, confidence intervals were constructed for each of the Appendix IV constituents in accordance with the state requirements in each downgradient well (Figure H). Note that confidence intervals require a minimum of 4 samples and, in many cases, the assessment wells had insufficient samples at this time.

The Sanitas software was used to calculate the tolerance limits and the confidence intervals. These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were used for Appendix IV parameters. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the GWPS prepared as described above. Nonparametric confidence intervals were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

Due to the required transformations to fit the data to a transformed normal distribution, the lower confidence limits resulted in negative numbers for some well/constituent pairs. Therefore, non-parametric confidence intervals, which are bound by reported high and low measurements within a given well, were constructed for these particular cases and may be found at the end of Figure H. This is a more conservative approach in that the lower confidence limit reflects the lowest reported measurement in the data set rather than a negative number.

Confidence intervals were compared to the GWPS prepared as described above. Only when the entire confidence interval is above a GWPS is the downgradient well/constituent pair considered to exceed its respective standard. If there is an exceedance of the GWPS, a statistically significant level (SSL) exceedance is identified. A summary of the confidence intervals follows this letter. Exceedances were noted for the following well/constituent pairs:

- Arsenic: DGWC-9
- Beryllium: DGWC-5, DGWC-9, DGWC-10, DGWC-47, DGWC-48, B-92, and B-93
- Cobalt: DGWC-8, DGWC-9, DGWC-10, DGWC-19, DGWC-20, DGWC-47, DGWC-48, B-56, B-63, B-92, B-93, and B-104D
- Combined Radium 226 + 228: B-104D and B-109D
- Lithium: DGWC-47, DGWC-48, and B-120D

#### Trend Test Evaluation – Appendix IV

Data at wells with confidence interval exceedances are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable at the 99% confidence level (Figure I). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. When trends are present in upgradient trends, it is an indication of variability in groundwater quality unrelated to practices at the site. Note that a trend test was not included for cobalt at well B-92 because trend tests require a minimum of 5 samples and these well/constituent pairs do not yet meet the minimum sample requirement. A summary of the Appendix IV trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

#### Increasing

- Cobalt: DGWC-9

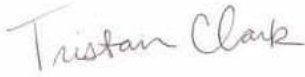

Decreasing

- Beryllium: DGWA-70A (upgradient), DGWC-47 and DGWC-48
- Cobalt: DGWA-53 (upgradient), DGWC-8, DGWC-10, DGWC-47, and DGWC-48
- Combined Radium 226 + 228: DGWA-53 (upgradient)
- Lithium: DGWC-47 and DGWC-48

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for McDonough AP-2,3,4. If you have any questions or comments, please feel free to contact us.

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-14, DGWC-15, DGWC-17, DGWC-19, DGWC-2, DGWC-20...

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 50 background values. 26% NDs. Annual per-constituent alpha = 0.02796. Individual comparison alpha = 0.0007087 (1 of 2). Comparing 20 points to limit.

Constituent: Boron, total Analysis Run 4/17/2023 9:06 AM View: Interwell PL (234) Plant McDonough Client: Southern Company Data: McDonough AP

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 50 background values. 4% NDs. Annual per-constituent alpha = 0.02796. Individual comparison alpha = 0.0007087 (1 of 2). Comparing 20 points to limit.

Constituent: Calcium, total Analysis Run 4/17/2023 9:06 AM View: Interwell PL (234) Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-13, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22, DGWC-23...

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 52 background values. Annual per-constituent alpha = 0.02637. Individual comparison alpha = 0.0006679 (1 of 2). Comparing 20 points to limit.

Constituent: Chloride, Total Analysis Run 4/17/2023 9:06 AM View: Interwell PL (234) Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-20, DGWC-47, DGWC-48, DGWC-9

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 57 background values. 47.37% NDs. Annual per-constituent alpha = 0.0224. Individual comparison alpha = 0.0005663 (1 of 2). Comparing 20 points to limit.

Constituent: Fluoride, total Analysis Run 4/17/2023 9:06 AM View: Interwell PL (234) Plant McDonough Client: Southern Company Data: McDonough AP

Prediction Limit  
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 59 background values. Annual per-constituent alpha = 0.04163. Individual comparison alpha = 0.001051 (1 of 2). Comparing 20 points to limit.

### Sen's Slope Estimator

DGWA-53 (bg)

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWA-70A (bg)

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWA-71 (bg)

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-10

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-20

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-47

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-48

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-9

Constituent: Fluoride, total Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWA-53 (bg)

Constituent: pH, Field Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWA-70A (bg)

n = 19  
 Slope = -0.02248 units per year.  
 Mann-Kendall statistic = -34  
 critical = -74  
 Trend not significant at 99% confidence level (α = 0.005 per tail).

Constituent: pH, Field Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWA-71 (bg)

n = 20  
 Slope = 0.000959 units per year.  
 Mann-Kendall statistic = 2  
 critical = 81  
 Trend not significant at 99% confidence level (α = 0.005 per tail).

Constituent: pH, Field Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-10

n = 20  
 Slope = 0.00524 units per year.  
 Mann-Kendall statistic = 6  
 critical = 81  
 Trend not significant at 99% confidence level (α = 0.005 per tail).

Constituent: pH, Field Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-17

n = 20  
 Slope = 0.002621 units per year.  
 Mann-Kendall statistic = 15  
 critical = 81  
 Trend not significant at 99% confidence level (α = 0.005 per tail).

Constituent: pH, Field Analysis Run 4/17/2023 9:04 AM View: A3 Trend Test (234)  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Sen's Slope Estimator

DGWC-19

n = 19  
 Slope = 0.03563  
 units per year.  
 Mann-Kendall  
 statistic = 84  
 critical = 74  
 Increasing trend  
 significant at 99%  
 confidence level  
 ( $\alpha = 0.005$  per  
 tail).

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted.

Constituent: Antimony Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:51 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 5/4/2023 2:52 PM View: AP 234 Confidence Intervals

**APPENDIX E**

# Well Installation (B-125D) Report

May 30, 2023

Project No. GL166849622

**Ms. Lauren Hartley, PG**  
Southern Company Services  
241 Ralph McGill Blvd NE  
Atlanta, GA 30308  
laucoker@southernco.com

**SUBJECT: WELL INSTALLATION (B-125D) REPORT  
GEORGIA POWER COMPANY - PLANT MCDONOUGH, SMYRNA, GEORGIA**

Dear Ms. Hartley:

WSP USA Inc. (WSP) is submitting this *Well Installation (B-125D) Report* to Southern Company Services, Inc. (SCS) and Georgia Power Company (Georgia Power), to document the construction of one monitoring well at Plant McDonough in Smyrna, Georgia (Site). Monitoring well construction activities were performed in general accordance with the standards described in the United States Environmental Protection Agency, Region 4 Science and Ecosystem Support Division, Operating Procedure for *Design and Installation of Monitoring Wells* (SESDGUID-101-R2 January 16, 2018) and the Georgia Water Wells Standards Act of 1985. The installation of the monitoring well was conducted under the oversight and direction of Chris Tidwell, a Georgia Registered Professional Geologist (PG).

The field activities for this investigation were performed from March through April 2023. The field work consisted of the installation and development of one (1) monitoring well. Metro Engineering & Surveying (Metro) conducted a survey of the monitoring well on May 4, 2023. A summary of the activities is presented below. Figure 1 presents the location of the newly installed monitoring well.

### **Monitoring Well Drilling and Construction Activities**

On March 13 through March 31, 2023, monitoring B-125D was drilled and installed by Cascade Drilling, LP, under contract to SCS. Cascade has a current and valid bond with the Water Wells Standards Advisory Council for the State of Georgia (Appendix A).

An experienced WSP professional geologist registered to practice in the state of Georgia was present on site to oversee and record the drilling and well construction. Rotasonic drilling techniques were employed for borehole advancement. The drilling equipment consisted of a full-sized TSI 150T Truck-Mounted Sonic drilling rig, equipped with 4-inch sonic rods with a 6-inch outer overdrive casing. During the drilling, continuous core samples were collected and logged in the field for lithologic and geotechnical properties. Prior to drilling, the drill rig and the downhole equipment were steam cleaned. The boring (lithologic) logs for B-125D are included in Appendix B. Borehole geophysics were conducted on the borehole for well B-125D to identify the depth of the well screen placement in the bedrock interval at the well location.

## **Borehole Geophysics**

Borehole geophysics was conducted in the borehole for well B-125D to identify potential water-producing fractures to aid in the placement of the well screen. Geophysical tests included acoustic televiwer, caliper, heat pulse flow meter, fluid temperature, and fluid conductivity. Fluid temperature and resistivity remained relatively consistent throughout the borehole, though a notable decrease in the fluid resistivity was observed from approximately 122.5 feet below ground surface (bgs) to the bottom of the borehole. The heat pulse flow meter (HPFM) data indicated that groundwater flow from the detected fracture zones was mostly negligible, although two zones indicated minor upward flow, ranging from 0.02 up to 0.05 gallons per minute (gpm) under ambient conditions from 99.5 to 113.0 feet bgs. Based on the geophysics data the well screen was placed at 135.1 to 145.1 feet, bgs. Borehole geophysical logs are included in Appendix C.

## **Well Construction**

Following the completion of the geophysics, monitoring well B-125D was constructed within the borehole. The total well depth for B-125D is 145.4 feet, bgs, including the well end cap. The depth of the screen and total well depth was selected based on the results of the geophysics borehole logging. The construction data are summarized in Table 1, and the location of the monitoring well is provided in Figure 1.

The well was constructed using factory-cleaned and sealed Schedule 40 polyvinyl chloride (PVC) products with flush-threaded fittings. The PVC products used were American Society for Testing and Materials (ASTM) and National Sanitation Foundation (NSF) rated. Monitoring well B-125D was constructed with a 10-foot section of 4-inch outside diameter (OD) and 2-inch inside diameter (ID), flush-threaded, with 0.010-inch factory-slotted PVC, U-Pack well screen. The annulus of the U-Pack screen section was filled with No. 2 filter sand, prior to insertion into the borehole. The screen was placed near the bottom of the borehole, with the remainder of the well casing constructed from 10-foot sections of 2-inch ID, flush-threaded, PVC casing riser. A flush-threaded PVC end cap was placed on the bottom of the well casing pipe to provide a 3-inch sump/sediment trap, and the top of the well casing extended to approximately 2.8 feet above grade. Construction details for the monitoring well are shown on the boring/construction logs in Appendix B.

Following placement of the screen and casing, the annular space in the borehole adjacent to the screen was filled with US Standard Sieve size No. 2 filter pack sand as appropriate for the formation. The filter pack sand was placed into the borehole using the tremie-pipe method and extended approximately 2 to 3 feet above the depth of the top of the well screen. A bentonite-pellet seal, consisting of 3/8-inch diameter coated bentonite pellets, approximately 4.6 feet thick, was then placed on top of the sand filter pack by slowly pouring the material down the borehole and tamping it into place. The bentonite was hydrated with potable water and allowed to cure for more than 12 hours prior to grouting the well.

Following hydration of the bentonite, the remaining annular space was grouted with an AquaGuard® bentonite grout mixture to approximately two feet below ground surface using the tremie method and low-pressure injection. AquaGuard® is a bentonite grout consisting of bentonite and additives that allow for a mixture of 30% solids by weight to facilitate grouting via tremie pipe, with additives that slows the bentonite curing so that proper placement can be achieved. A water-tight locking cap with a hole for pressure-equilibrium was installed on top of the PVC well casing. A mark was installed on the top of the PVC casing to be used for reference during future survey and water-level measurements. The monitoring well surface completion consisted of a locked, anodized aluminum protective post casing and a 4-foot by 4-foot by 4-inch concrete pad with an engraved metal tag showing the well

name. The annular space of the aluminum protective casing was filled with pea gravel to approximately two inches from top of PVC. A weep hole was drilled into the lower side of the protective casing to allow for drainage.

### **Monitoring Well Development Activities**

The newly installed monitoring well was developed on April 3 through 5, 2023 in general accordance with the *Monitoring Well Development Procedures* prepared by SCS (March 2016), and the US EPA Science and Ecosystem Support Division *Design and Installation of Monitoring Wells* (SESDGUID-101-R2 January 16, 2018). The monitoring well was surged using a Reclaimer® pump system. During development, water quality measurements of pH, temperature, specific conductance, oxidation reduction potential (ORP), dissolved oxygen (DO), and turbidity were measured and recorded using field-calibrated water quality equipment. AquaTroll® multimeter and a Hach turbidimeter were used for measuring water quality parameters. Equipment calibration forms and development forms are included in Appendix B with development details summarized in Table 2. Development was terminated when water quality parameters stabilized.

During development, monitoring well B-125D was pumped dry a total of three times and allowed to recharge overnight for three consecutive days. A total of 155 gallons of water was purged from the well, during development. Water level measurements were collected using a decontaminated electronic water level indicator, referenced to a permanent marking at the top of the PVC casing and recorded to within 0.01 foot. The water quality parameters and water levels measured on April 5, 2023 had stabilized, with the exception of turbidity. Due to low water production during well development, the development was discontinued prior to reaching the turbidity goal of 5 NTUs. However, during low flow sampling, the turbidity requirement was met.

### **Monitoring Well Survey**

The newly installed monitoring well was surveyed in early May 2023 by Metro Engineering & Surveying Company, Inc. The top of the PVC casing at the reference mark and the survey nail in the concrete pad were surveyed to 0.5-foot horizontal tolerance referenced to the Georgia State Plane, West Zone, NAD83 (2011) and 0.01-foot vertical tolerance referenced to the North America Vertical Datum of 1988 (NAVD88). Surveyed coordinates and elevations are presented on the boring/construction diagrams and on Table 1. The certified surveyor's report, dated May 8, 2023 is attached as Appendix D.

**Certification**

We appreciate the opportunity to assist Southern Company Services, Inc. and Georgia Power with this project. Should you have any questions or require additional information, please contact the undersigned at (770) 496-1893.

Sincerely,

**WSP USA INC.**

# Power of Attorney

KNOW ALL MEN BY THESE PRESENTS, that ATLANTIC SPECIALTY INSURANCE COMPANY, a New York corporation with its principal office in Plymouth, Minnesota, does hereby constitute and appoint: **Deanna M. French, Susan B. Larson, Elizabeth R. Hahn, Jana M. Roy, Scott McGilvray, Mindee L. Rankin, Ronald J. Lange, John R. Claeys, Roger Kaltenbach, Guy Armfield, Scott Fisher, Andrew P. Larsen, Nicholas Fredrickson, William M. Smith, Derek Sabo, Charla M. Boadle**, each individually if there be more than one named, its true and lawful Attorney-in-Fact, to make, execute, seal and deliver, for and on its behalf as surety, any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof; provided that no bond or undertaking executed under this authority shall exceed in amount the sum of: **unlimited** and the execution of such bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof in pursuance of these presents, shall be as binding upon said Company as if they had been fully signed by an authorized officer of the Company and sealed with the Company seal. This Power of Attorney is made and executed by authority of the following resolutions adopted by the Board of Directors of ATLANTIC SPECIALTY INSURANCE COMPANY on the twenty-fifth day of September, 2012:

Resolved: That the President, any Senior Vice President or Vice-President (each an "Authorized Officer") may execute for and in behalf of the Company any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof, and affix the seal of the Company thereto; and that the Authorized Officer may appoint and authorize an Attorney-in-Fact to execute on behalf of the Company any and all such instruments and to affix the Company seal thereto; and that the Authorized Officer may at any time remove any such Attorney-in-Fact and revoke all power and authority given to any such Attorney-in-Fact.

Resolved: That the Attorney-in-Fact may be given full power and authority to execute for and in the name and on behalf of the Company any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof, and any such instrument executed by any such Attorney-in-Fact shall be as binding upon the Company as if signed and sealed by an Authorized Officer and, further, the Attorney-in-Fact is hereby authorized to verify any affidavit required to be attached to bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof.

This power of attorney is signed and sealed by facsimile under the authority of the following Resolution adopted by the Board of Directors of ATLANTIC SPECIALTY INSURANCE COMPANY on the twenty-fifth day of September, 2012:

Resolved: That the signature of an Authorized Officer, the signature of the Secretary or the Assistant Secretary, and the Company seal may be affixed by facsimile to any power of attorney or to any certificate relating thereto appointing an Attorney-in-Fact for purposes only of executing and sealing any bond, undertaking, recognizance or other written obligation in the nature thereof, and any such signature and seal where so used, being hereby adopted by the Company as the original signature of such officer and the original seal of the Company, to be valid and binding upon the Company with the same force and effect as though manually affixed.

IN WITNESS WHEREOF, ATLANTIC SPECIALTY INSURANCE COMPANY has caused these presents to be signed by an Authorized Officer and the seal of the Company to be affixed this twenty-seventh day of April, 2020.

By *Paul J. Brehm*  
Paul J. Brehm, Senior Vice President

STATE OF MINNESOTA  
HENNEPIN COUNTY

On this twenty-seventh day of April, 2020, before me personally came Paul J. Brehm, Senior Vice President of ATLANTIC SPECIALTY INSURANCE COMPANY, to me personally known to be the individual and officer described in and who executed the preceding instrument, and he acknowledged the execution of the same, and being by me duly sworn, that he is the said officer of the Company aforesaid, and that the seal affixed to the preceding instrument is the seal of said Company and that the said seal and the signature as such officer was duly affixed and subscribed to the said instrument by the authority and at the direction of the Company.

*Alison Nash-Trout*  
Notary Public

I, the undersigned, Secretary of ATLANTIC SPECIALTY INSURANCE COMPANY, a New York Corporation, do hereby certify that the foregoing power of attorney is in full force and has not been revoked, and the resolutions set forth above are now in force.

Signed and sealed. Dated 12 day of April, 2021.

This Power of Attorney expires  
January 31, 2025

CERTIFICATE

Atlantic Specialty Insurance Company

, Surety upon

a certain Bond No. 800033976

dated effective 09/27/2017  
(MONTH-DAY-YEAR)

on behalf of Ricky Davis / Cascade Drilling, L.P.  
(PRINCIPAL)

and in favor of Department of Natural Resources, State of Georgia  
(OBLIGEE)

does hereby continue said bond in force for the further period

beginning on 06/30/2021  
(MONTH-DAY-YEAR)

and ending on 06/30/2023  
(MONTH-DAY-YEAR)

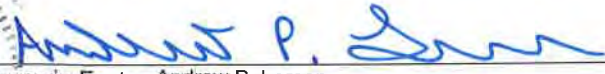

Amount of bond Thirty Thousand and 00/100 Dollars (\$30,000.00)

Description of bond Performance Bond for Water Well Contractors

**PROVIDED: That this continuation certificate does not create a new obligation and is executed upon the express condition and provision that the Surety's liability under said bond and this and all Continuation Certificates issued in connection therewith shall not be cumulative and that the said Surety's aggregate liability under said bond and this and all such Continuation Certificates on account of all defaults committed during the period (regardless of the number of years) said bond had been and shall be in force, shall not in any event exceed the amount of said bond as hereinbefore set forth.**

Signed and dated on April 12th, 2021  
(MONTH-DAY-YEAR)

---

Arcadis has prepared this technical memo to document the geophysical borehole investigation performed to provide additional characterization of potential fracture zones present within the borehole B-125D Vertical Delineation Area, located at the Georgia Power Plant McDonough-Atkinson in Smyrna, Georgia (Site). The objective of this borehole investigation was to improve understanding of the presence and characteristics of any fractures that may be present within the B-125D borehole. The borehole geophysical field activities were conducted across two separate mobilizations, on March 17 and 28, 2023.

## Geophysical Logging Equipment

Arcadis collected borehole geophysical logs using a portable Matrix system manufactured by the Mount Sopris Instrument Company in Golden, Colorado. This system is a digital, multi-channel system designed primarily for shallow environmental and engineering studies. The logging system consists of two primary components. The first is the integrated logging control unit, which remains at the surface with the equipment operator, and the second component is the downhole-logging probe. The control unit is joined physically and electronically to the chosen downhole probe with a steel cable, approximately 600 feet in length, containing a single insulated wire. The steel cable is spooled on an integrated electric winch mechanism. The downhole position of the probe is measured to a precision of 0.01 feet with a digital odometer. The electrical signals transmitted by the downhole probe are passed from the winch to a signal processor within the logging unit. The processed digital data collected include the probe depth, speed, and the probe-specific measurements of the borehole. The data are recorded in a portable computer for real-time viewing, and storage for later analysis.

The geophysical probes utilized on this project include:

1. Fluid Temperature/Resistivity probe;
2. Three-Arm Caliper probe;
3. Acoustic Televiwer probe;
4. Optical Televiwer probe;

5. Vertical Flow/Heat Pulse Flow probe;

Data from these probes were collected in a near-continuous manner in the borehole from the ground surface to final depth (after the second mobilization) of approximately 219 feet below ground surface (BGS) at a near-constant speed ranging from 5 to 15 feet per minute, depending on the probe. The individual probes are discussed in the subsections below.

### **Fluid Temperature/Resistivity Probe**

A Mount Sopris 2WQA-1000 fluid temperature/resistivity probe was used to provide borehole fluid temperature and fluid resistivity measurements. The standard temperature log, based on a thermister, is designed to provide a measure of the ambient geothermal gradient, but is also helpful in detecting anomalies caused by events such as fluid flow into the borehole. The borehole fluid resistivity is directly proportional to the concentration of dissolved minerals. It is generally used in hydrogeology to determine the concentration of dissolved ions in the aquifers and to locate the fluid flows occurring in the borehole, especially if some time has passed and the temperature features have dissipated.

### **Three-arm Caliper Probe**

A Mount Sopris 2PCA-1000 three-arm caliper probe was used to provide detailed information on the nominal diameter of the borehole. Once the probe has been lowered to the bottom of the boring, three spring arms expand into the open boring and provide a measure of the effective diameter of the boring. Several, valuable pieces of information can be derived from the three-arm caliper log. In the open bedrock portions of the boring, the locations of potential changes in rock type and the locations of fracture zones can be interpreted. Generally, fractured rock is less resistant to mechanical forces with the result that borehole diameter will be enlarged by the drilling/coring process in fracture zones. A larger, more irregular boring diameter will be indicated on the logs in fracture zones. In contrast, more competent rock will tend to have a much smoother appearance near the drilled borehole diameter.

### **Acoustic Televiewer Probe**

An ABI40 AcousticTeleviewer (MK2) manufactured by Advanced Logic Technology (ALT) was used to image the bedrock fractures within the borehole. An acoustic televiewer probe works by emitting ultrasonic energy pulses at a frequency of approximately 1.2MHz. These ultrasonic pulses travels outward from the probe, through the borehole fluid, to the borehole wall, where a part of the pulse gets reflected back towards the probe, and the rest of it continues through the bedrock with a different velocity. The travel time and the amplitude of reflected energy are utilized to image the borehole wall and may also provide some information about the orientation of the fracture zones within the borehole. Generally, hard, competent rock reflects much more of the acoustic energy back (higher reflection amplitude = light gray in color) to the probe than softer, weathered/fractured rock, which tends absorb, transmit, or scatter most of the energy (lower reflection amplitude = black in color).

### **Vertical Flow/Heat Pulse Flow Probe**

While the other probes were used to characterize the vertical extent and delineate the various fracture zones present within the borehole, the Mount Sopris HFP-2293 heat pulse flow meter (HPFM) was used to determine the approximate rate of vertical fluid flow emanating from the fracture zones. Vertical fluid flow within a borehole is typically caused by the difference in hydraulic head between a fracture with high head to

a fracture with low head, although temperature/density variations within the fluid emanating from a given fracture can also contribute to vertical flow. The heat pulse flow probe consists of a central conductor, which triggers the heat pulse, and two sensors at both the upper and lower end of the probe. The central conductor generates a heat pulse, which heats a volume of fluid (water in this case) next to the conductor in borehole, and depending upon the vertical flow of water (or lack thereof) in the borehole, the volume of warm water is detected at either the upper (upward flow = positive values) or lower sensors (downward flow = negative values). The peak temperature difference and time taken by the volume of water to travel from the center to one of the sensors is recorded in a computer at the surface, which is then used to determine the flow rate within a given depth interval of the borehole. For this project, heat pulse flow data was collected both under ambient, as well as pumping conditions.

## Results and Interpretations

After data collection, the borehole geophysical logs were downloaded to a PC, converted from the binary format to a usable Microsoft Excel format, then filtered and statistically correlated using Grapher (ver.11) by Golden Software. The filtered logs were then imported into WellCad (ver.5.1) for final processing and plotting.

The final borehole logs are included on the compiled geophysical log of B-125D, which is presented in **Attachment A**. In general, the borehole datasets correlate well with rock cuttings observed during drilling, and with each other: the small number of fracture zones detected on the caliper logs correspond with zones of decreased reflection amplitude in the acoustic televiewer. Fluid temperature and resistivity remained relatively consistent throughout the borehole, though a notable decrease in the fluid resistivity was observed from approximately 122.5 feet BGS to the bottom of the borehole. The HPFM data indicated that groundwater flow from the detected fracture zones was mostly negligible, although two zones indicated minor upward flow, ranging from 0.02 up to 0.05 gallons per minute (gpm) under ambient conditions. No flow was observed under pumping conditions.

## Conclusions

Arcadis performed a limited borehole geophysical investigation of the B-125D Vertical Delineation Area, located within Georgia Power Plant McDonough-Atkinson for the purpose of obtaining additional characterization of potential fracture zones located beneath the Site. In summary, minimal fracturing were observed within the borehole. Groundwater flow from these few fractures was observed to be negligible, though what little was observed was upward, ranging from 0.02 up to 0.05 gpm under ambient conditions. No flow was observed under pumping conditions.

Despite the lack of flow observed within the bedrock, these borehole datasets were successful in providing additional lines of evidence to further refine the understanding of bedrock structure beneath the site. This memo includes a limited set of data within the project site. The conclusions drawn from this investigation are considered reliable; however, there may exist localized variations in the subsurface conditions that have not been completely defined at this time.

## SURVEYOR'S REPORT

### SCOPE OF WORK:

Field survey of existing monitoring wells at Georgia Power Company, Plant McDonough in Smyrna, GA.

Horizontal and vertical datum was derived from RTK GPS observations with corrections received via a cellular modem utilizing the Leica "Smartnet" RTK Network and conventional surveying equipment. Horizontal datum is Georgia State Plane, West Zone, NAD83(2011) and vertical datum is NAVD88.

### EQUIPMENT USED TO ESTABLISH THE MONITORING WELL LOCATIONS:

Leica GS18T GPS Receiver  
Leica TS16 Total Station  
Leica DNA10 Digital Level

### CERTIFICATION:

I hereby certify that the center of well casing (PVC) has a horizontal accuracy of 0.5+/- feet or better using a Leica GS18T GPS (survey-grade) global positioning system receiver referencing the Georgia State Plane, West Zone, NAD83(2011) coordinate system in US survey feet. The top of well casing (PVC) elevation data was determined in feet above mean sea level based on the NAVD88 vertical datum. Vertical data was confirmed to be accurate within 0.01 foot through establishment of a closed level check loop with a Leica DNA10 digital level having a published accuracy of 0.9mm per dual-traverse kilometer.

**SUBJECT: Georgia Power Company – Plant McDonough Ash Pond 1 and 2, 3/4  
Supplemental ASD for Combined Radium at Groundwater Monitoring Wells: DGWA-53, B-104D, B-105D, B-109D, B-111D, B-115D, B-122D  
GEOS Submittal: 758576**

Dear Ms. McNelly,

The Georgia Environmental Protection Division (EPD) has reviewed the *Supplemental ASD* (Alternate Source Demonstration) for *Combined Radium* submitted through GEOS on May 24, 2023 for the subject facility. This submittal builds on previous GEOS Submittals IDs: 659072, 685509 submitted on April 29, 2022, and July 27, 2022, respectively, which attributes the Statistically Significant Increases (SSIs) and Maximum Contaminant Level (MCL) exceedances for combined radium 226 and 228 in the subject wells to natural occurrence.

In accordance with the Georgia Rules for Solid Waste Management Section 394-3-4-.10(6) and based upon information included in the subject submittal and the latest semi-annual groundwater report under Submittal ID: 726842, EPD hereby approves this ASD for combined radium due to natural occurrence in groundwater wells **B-104D and B-109D only**. Wells B-104D and B-109D are the only subject wells that have an SSI for combined radium.

If you have any questions regarding this letter, please contact Mark Wescott at [mark.wescott@dnr.ga.gov](mailto:mark.wescott@dnr.ga.gov) or (404) 362-2584.

## 1.0 INTRODUCTION

This Supplemental Alternative Source Demonstration (ASD) is an addendum to the ASD for Plant McDonough-Atkinson, prepared by Golder and submitted to Georgia Environmental Protection Division (GA EPD) on April 21, 2022, and revised and resubmitted July 26, 2022 (WSP Golder 2022). The ASD reported the results of an investigation performed to evaluate the presence of naturally occurring combined radium in soils and rock (i.e., aquifer solids) at Georgia Power Company (Georgia Power)’s Plant McDonough-Atkinson in the vicinity of Ash Pond 1 (AP-1) and Ash Pond 2 and 3/4 (AP-2 and 3/4). This addendum provides supplemental information supporting the natural occurrence of radionuclides in groundwater at the Site through analysis of rock and soil samples from the Site. Analytical results reported here affirm the natural occurrence and mobility of radium in the aquifer media at AP-1 and AP-2 and 3/4 and supports the demonstration of an alternate source for radium in groundwater at the Site.

In accordance with the United States Environmental Protection Agency (US EPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015) (CCR Rule or The Rule), this Supplemental ASD, Plant McDonough AP-1 and AP-2 and 3/4 has been prepared to document an alternate source for Statistically Significant Levels (SSLs) and concentrations of combined radium (radium 226 + 228) identified at the Site during assessment monitoring. The following site monitoring wells either have documented an SSL for combined radium during assessment monitoring or have exhibited concentrations of combined radium exceeding the Maximum Contaminant Level (MCL) during delineation investigations.

Well ID	Range of Concentrations (pCi/L)
DGWA-53	1.04 - 6.36
B-104D	9.12 – 17
B-105D	1.28 - 6.88
B-109D	9.45 - 17.7
B-111D	4.39 – 12.3
B-115D	8.6 – 14.7
B-122D	7.94 – 13.1

This document satisfies the requirements of § 257.95(g)(3)(ii) and § 391 3-4-.14(23)(c) which allows the owner or operator to demonstrate that a source other than the CCR Unit has caused an SSL. This Supplemental ASD provides the following lines of evidence:

- Results of petrographic analyses from bedrock samples (including upgradient location B-53/DGWA-53) indicate presence of accessory minerals including pyrite, zircon, epidote, apatite, ilmenite, sphene (titanite), monazite, and allanite. These minerals are known to carry radioactive isotopes such as uranium, thorium, and their related daughter products including radium.
- Results of SEM analysis of the bedrock samples identified the minerals allanite, thorite and monazite in the granitic gneiss. EDS spectra from monazite show characteristic uranium and thorium peaks indicating a possible source material for uranium, thorium, and associated decay products.

- Whole-rock geochemistry showed the radiogenic elements uranium, thorium, and potassium were detected in all of the rock samples collected from the Long Island Creek Gneiss, button schist and metagraywacke.

These new lines of evidence further support those lines of evidence documented previously (WSP Golder 2022):

- Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.
- Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- The wells with elevated radium concentrations show low levels of CCR indicator parameters.
- Parent isotopes and quantified radionuclides have been sampled and noted in downgradient bedrock wells exhibiting detections above the MCL with some exhibiting SSLs above background.

This information has been prepared to document that the SSLs and MCL exceedances noted at wells, DGWA-53, B-104D, B-105D, B-109D, B-111D, B-115D, and B-122D are the result of natural occurrences of radionuclides in the subsurface and not the release from the CCR Unit.

## 2.0 GEOLOGICAL SETTING

The Site is situated in the Piedmont province, in a regional zone of geologic deformation, referred to as the Brevard Zone, which extends from Alabama to Virginia. Figure 1 presents the geologic map for the area around Plant McDonough. The plant property northwest of the faulted contact is underlain by the Long Island Creek Gneiss, which is a medium to coarse-grained felsic rock. Near faults and shear zones, the gneiss is locally intruded by another felsic rock, i.e., granitic pegmatites. Pegmatites are coarse-grained igneous rocks formed in the late stage of magma crystallization and noted for their high textural and compositional variability and enrichment of trace elements such as uranium, thorium, rare-earth elements (Adams et al. 1980). Numerous studies have evaluated the presence of the radionuclides radium, uranium, and thorium in aquifer solids and groundwater in principal aquifers in the US and abroad (e.g., Chapman et al. 2013; Ranger 1995; Rosson et al. 1991; Szabo et al. 2012; Stackelberg et al. 2018; Vinson et al. 2013) and specifically in Georgia, granite and gneiss aquifers in the Piedmont were identified to have the highest concentrations of naturally occurring radionuclides (Coker and Olive 1989).

Uranium and thorium are naturally occurring in the soils, rock, and groundwater of the aquifers in the U.S. at varying levels and decay to form radium (Hem 1985; Langmuir 1997; Nolan et al. 2021). Felsic rock types, i.e., rock types containing abundant silicate minerals such as feldspar and quartz, are naturally enriched in uranium and thorium, the parent elements of radium. For reference, average uranium and thorium concentrations in the earth's crust are 3 and 10 milligrams per kilogram (mg/kg). In basalt (a mafic rock) uranium and thorium average 0.6 and 2.2 mg/kg, respectively, and in granite (a felsic rock) 4.8 and 17 mg/kg, respectively (Smith and Huyck 1999). Concentrations of daughter elements such as radium show a similar distribution between the various rock types.

Groundwater in the Piedmont Physiographic Province (Piedmont) can occur as perched water within residual soils, as an unconfined regional aquifer within residual soils and transitionally weathered materials, and as a series of confined to semi-confined, discrete, but locally interconnected aquifer systems within the bedrock. Groundwater within the overburden, which is comprised of residual soils, saprolite, and transitionally weathered

rock (TWR), is generally unconfined and the groundwater surface is generally a subdued reflection of topography. In areas where bedrock is relatively shallow and when water levels are seasonally depressed, the regional groundwater potentiometric surface also occurs within the upper zones of weathered bedrock. Groundwater elevation data from January 31, 2023 were used to develop Figure 2. Site potentiometric maps indicate that groundwater generally flows southeast across the Site from the topographic high northwest of AP-3/4 towards AP-2 and the Chattahoochee River, which is consistent with historical observations.

### **3.0 CHARACTERIZATION OF AQUIFER MATERIALS**

Radium exists in nature as one of four isotopes:  $^{223}\text{Ra}$ ,  $^{224}\text{Ra}$ ,  $^{226}\text{Ra}$ , and  $^{228}\text{Ra}$ . Most of these naturally occurring radionuclides are derived from radioactive isotopes of uranium and thorium (parent element), whose daughter products yield  $^{226}\text{Ra}$  and  $^{228}\text{Ra}$ , respectively. These parent radioactive elements are concentrated in certain minerals that are commonly found in igneous, metamorphic and sedimentary rocks across the United States including this part of Georgia. Zircon, monazite, and apatite are the most common accessory minerals in which uranium and thorium occur, which are primarily associated with felsic igneous and metamorphic rocks such as granite, gneissic granite, granitic gneiss, granitic pegmatite, and to a lesser extent vein quartz. Groundwater in the igneous and metamorphic rocks of Piedmont and Blue Ridge regions of Georgia are known to contain uranium, thorium, radium, and radon at relatively higher concentrations due to the occurrence of these radionuclides in the source rocks (Szabo et al., 2012).

#### **3.1 Sample Collection**

In October 2016, rock core samples from upgradient and downgradient areas representative of site lithologies were collected for laboratory analyses. Rock core samples were collected from upgradient borehole B-53 which later was converted to a monitoring well (DGWA-53). This location represents a background location in the Long Island Creek gneiss lithology. Two other downgradient samples from locations representing Long Island Creek Gneiss and button schist lithologies were also sampled and analyzed. Photographs of the core samples that were collected for geochemical and petrographic analysis are presented in Appendix A.

Samples were cut from each of the core samples for use in petrographic and laboratory analysis. Cuts were made perpendicular to foliation so that the samples would reflect a greater representation of metamorphic layers, and consequently, greater exposure of mineralogy and geochemistry. Uncoated, polished thin- or thick-sections were used for the petrographic and Scanning Electron Microscopy (SEM) analyses, and the remaining core ground to a powder for use in the whole-rock geochemical analyses.

#### **3.2 Petrographic Analysis**

A representative rock core samples were collected from B-53/DGWA-53, B-54, and B-57. The selected core samples were cut perpendicular to the metamorphic foliation to get the most representative mineralogy and textures for each sample. Thin section billets were then cut and sent to National Petrographic for preparation of polished thin sections. Each thin section billet was encased in clear epoxy to make a regular sample that could be used by the thin section preparation equipment.

After encasing in clear epoxy, the samples were cut using a water-based cutoff saw. After cutting, the cut surface was ground and then epoxied to a microscope slide. After drying the epoxy at 130 °C for 35 minutes, the billets were cut off from the microscope slides and the epoxied material was ground to approximately 35 microns ( $\mu\text{m}$ ). After reaching 35 $\mu\text{m}$ , the samples were then polished using a roto-polishing system.

Photomicrographs of the thin sections were taken using plane-polarized light (PPL) or cross-polarized light (XPL) using a Leica DM 2500P petrographic microscope and Leica DFC 420 digital camera in the microscopy lab at the University of West Georgia. Unless otherwise indicated, all images were taken at 2.5x magnification; the long edge of the field of view in the photographs is approximately 4.0 millimeter (mm) in length. Representative photomicrographs are shown in Appendix A.

### 3.3 Scanning Electron Microscopy – SEM

Qualitative backscattered electron imaging (BSE) and identification of potential Uranium (U)/Thorium (Th)-bearing accessory minerals in uncoated, polished thin-sections were conducted using the FEI Quanta 200 SEM instrument and attached Bruker EDX detector for semi-quantitative analysis. Analyses were completed using a 20 kV accelerating voltage on the filament and a partial vacuum of 0.45 Torr in the sample chamber. Images and spectra were collected, processed, and annotated using the Bruker ESPRIT software package. Images resulting from the SEM analyses are presented in Appendix A.

### 3.4 Whole-Rock Geochemistry

Samples were inspected visually for weathering, and weathered portions were removed by rock saw prior to grinding. Samples were placed in a drying oven at 90°C. After drying, samples were crushed in a jaw crusher with steel grinding plates to prepare the sample to 90% at a -10 mesh. After jaw crushing, the samples were split using a Jones riffle splitter to obtain a statistically representative reduce volume aliquot. The split samples were then transferred into ring and puck shatterbox where samples were reduced to a fine powder (200 mesh). A 0.5-gram sample is then weighed and placed into Teflon sample tubes for acid digestion with HNO<sub>3</sub>+HCl+HF+HClO<sub>4</sub> for 1 hour. Major, minor and trace element concentrations of the samples were determined by Inductively Coupled Plasma- Atomic Emission Spectrometer (ICP-AES) and ICP-Mass Spectrometry (MS) by American Assay Laboratory in Sparks, Nevada using their ICP-4B-UT and ICP-NF protocols.

## 4.0 ANALYTICAL RESULTS

### 4.1 Petrographic Analysis

Petrographic analysis was conducted on Long Island Creek gneiss samples collected in B-53 and B-54 indicate thin folia of biotite and less abundant muscovite in a quartzofeldspathic matrix that consists of porphyroclastic, partially recrystallized alkali feldspar, ribbon quartz, and plagioclase. Accessory minerals observed include pyrite, zircon, epidote, apatite, ilmenite, sphene (titanite), monazite, and allanite. Indication of shearing was observed in these photomicrographs, including elongated feldspar porphyroclasts and ribbon quartz.

Petrographic analysis of core B-57 represents button schist interlayered with metagraywacke and occur in fault contact and southeast of the Long Island Creek Gneiss, occupying roughly one-half of the site, and show foliated matrix of quartz, muscovite and biotite, and shearing within this lithology.

### 4.2 Scanning Electron Microscopy - SEM

Radiogenic minerals identified from SEM analyses in representative core samples from the Long Island Creek Gneiss include the following:

- Zircon
- Apatite
- Titanite
- Thorite
- Epidote
- Ilmenite
- Monazite
- Allanite

Energy dispersive spectroscopy (EDS) and BSE images of cores samples are presented as Appendix A. In the BSE images, minerals that contain elements with low atomic numbers are shown in gray tones. Minerals that contain elements with large atomic numbers, generally show up as “bright” spots on the BSE image. Because uranium and thorium have atomic numbers of 92 and 90 respectively, minerals that contain these elements are “brighter” than the surrounding matrix.

Once a mineral with high atomic number elements was identified in the BSE image, the mineral was analyzed using EDS. EDS is an analytical technique for elemental analysis based on x-ray emission caused by electrons that are dislodged from the inner orbitals by an x-ray beam from the instrument. As the inner electron is ejected from the inner shell, the electron hole is filled by electrons from higher-energy shells. This transformation from an outer to an inner shell releases energy in form of an x-ray that can be detected and quantified. The energy of the x-ray is characteristic for different elements and can be displayed on an EDS spectrum as a function of electron volts (KeV). EDS and BSE plots for each sample analyzed is presented in Appendix A.

### **4.3 Whole-Rock Geochemistry**

A summary of the elemental analysis of rock core samples from B-53, B-54, and B-57 is presented in Appendix A. The ICP-4B-UT protocol was selected because of the lower detection limit (0.1 ppm) for both uranium and thorium.

As indicated in these results, the radiogenic elements uranium, thorium, and potassium were detected in all of the rock samples collected from the Long Island Creek Gneiss, button schist and metagraywacke.

## **5.0 SOURCE DETERMINATION**

According to the USGS and EPA, naturally occurring radioactive material is present everywhere in North America. The concentration of resultant radioactivity measured in groundwater wells varies significantly, depending upon rock type and groundwater conditions. Surface mapping and boring logs from Plant McDonough indicate the presence of granitic gneiss, a rock type known to contain a naturally high concentration of minerals that carry radioactive isotopes such as uranium, thorium, and their related daughter products including radium. Furthermore, accessory minerals observed in the augen gneiss such as sphene are known to contain radionuclides and are commonly used for age dating purposes due to the presence of uranium in the crystal structure.

Based on surface geologic mapping and core logging, both B-53 and B-54 were advanced through lithologies of the Long Island Creek Gneiss, which is comprised of moderately foliated, felsic, granitic gneiss (meta-granite) with the ubiquitous occurrence of sphene and epidote occurring as accessory minerals. The mineralogy identified during petrographic analysis from samples collected in this unit is consistent with this lithology. The accessory minerals identified include zircon, apatite, titanite, pyrite, chalcopyrite, ilmenite, epidote, allanite, and monazite.

Locally, pleochroic halos around inclusions within biotite crystals support the presence of radioactive minerals in the rock. This interpretation is supported by results of SEM analysis, which identified the minerals allanite, thorite and monazite in the granitic gneiss. EDS spectra from monazite show characteristic uranium and thorium peaks indicating a possible source material for uranium, thorium, and associated decay products. This is further supported by the detection of uranium and thorium in the whole rock geochemistry. Additionally, allanite is enriched in light rare earth elements (LREE) which are commonly associated with uranium and/or thorium. Allanite is very unstable in a weathering environment and is one of the first minerals to undergo chemical weathering under saturated groundwater conditions. Based on the rock mineralogy and whole rock geochemistry,

the granitic gneiss bears naturally occurring, radioactive minerals in the bedrock upgradient of the ponds at Plant McDonough. The uranium and thorium-bearing minerals in the granitic gneiss and similar lithologies are the source of radium in groundwater at the Site.

## 6.0 ASD SUMMARY

In summary, this document satisfies the requirements of § 257.95(g)(3)(ii) and § 391 3-4-.14(23)(c) which allows the owner or operator to demonstrate that a source other than the CCR Unit has caused an SSL. As presented here and in the prior ASD (WSP Golder 2022), multiple lines of evidence supporting the natural source of combined radium are as follows:

- Results of petrographic analyses from bedrock samples (including upgradient location B-53/DGWA-53) indicate presence of accessory minerals including pyrite, zircon, epidote, apatite, ilmenite, sphene (titanite), monazite, and allanite. These minerals are known to carry radioactive isotopes such as uranium, thorium, and their related daughter products including radium.
- Results of SEM analysis of the bedrock samples identified the minerals allanite, thorite and monazite in the granitic gneiss. EDS spectra from monazite show characteristic uranium and thorium peaks indicating a possible source material for uranium, thorium, and associated decay products.
- Whole-rock geochemistry showed the radiogenic elements uranium, thorium, and potassium were detected in all of the rock samples collected from the Long Island Creek Gneiss, button schist and metagraywacke.

And as documented previously,

- Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.
- Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- The wells with elevated radium concentrations show low levels of CCR indicator parameters.
- Parent isotopes and quantified radionuclides have been sampled and noted in downgradient bedrock wells exhibiting detections above the MCL with some exhibiting SSLs above background.

This information has been prepared to document that the SSLs and MCL exceedances noted at wells, DGWA-53, B-104D, B-105D, B-109D, B-111D, B-115D, and B-122D are the result of natural occurrences of radionuclides in the subsurface and not a release from the CCR Unit.

**APPENDIX A**

**Rock Core Photographs, Photomicrographs and SEM  
Test Results**

Southern Company Service: Plant McDonough	
<p><b>PHOTO 1</b> B-53 16.0 feet</p>	 A photograph of a light-colored, irregular rock sample. The sample is marked with red handwritten text: "B53" and "16'-16.5". A GSA metric ruler is placed horizontally above the sample for scale. The ruler shows centimeter and inch markings.
<p><b>PHOTO 2</b> B-53 24.7 feet</p>	 A photograph of a light-colored, irregular rock sample. The sample is marked with red handwritten text: "B53" and "24'-24.9". A GSA metric ruler is placed horizontally below the sample for scale. The ruler shows centimeter and inch markings.

Southern Company Service: Plant McDonough	
<p><b>PHOTO 3</b> B-54 32.5 feet</p>	 A photograph of a light-colored, irregular rock sample. The sample is marked with red handwritten text: "B54" and "32.5". A GSA metric ruler is placed horizontally above the sample for scale. The ruler shows centimeter and inch markings.
<p><b>PHOTO 4</b> B-57 44.0 feet</p>	 A photograph of a light-colored, irregular rock sample. The sample is marked with red handwritten text: "B57" and "44.0". A GSA metric ruler is placed horizontally above the sample for scale. The ruler shows centimeter and inch markings.

**PHOTOMICROGRAPH SAMPLE B-53**  
**16.1 feet**

**B-53 16.1':** Representative photomicrograph of matrix of sample. Thin folia of biotite (dark brown) in a quartzofeldspathic matrix that includes porphyroclastic and partially recrystallized alkali feldspars. High-relief minerals include epidote and zircon.

Accessory phases in this sample include pyrite, zircon, epidote, apatite, and monazite.

B-53 16.1': BSE image (top) and EDS spectrum (bottom) for zircon in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 16.1': BSE image (top) and EDS spectrum (bottom) for epidote in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 16.1': BSE image (top) and EDS spectrum (bottom) for apatite in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 16.1': BSE image (top) and EDS spectrum (bottom) for monazite in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

**PHOTOMICROGRAPH SAMPLE B-53**  
**24.8 feet**

**B-53 24.8':** Representative photomicrograph of sample matrix, with thin folia of biotite mica (and less abundant muscovite) wrapping around porphyroclastic, partially recrystallized alkali feldspars, ribbon quartz, and small plagioclase.

Accessory minerals in this sample include ilmenite, zircon, apatite, and allanite.

B-53 24.8': BSE image (top) and EDS spectrum (bottom) for illmenite in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 24.8': BSE image (top) and EDS spectrum (bottom) for allanite in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 24.8': BSE image (top) and EDS spectrum (bottom) for zircon in Long Island Creek Gneiss; green crosshair on BSE image marks analysis location.

B-53 24.8': BSE image (top) and EDS spectrum (bottom) for thorite in Long Island Creek Gneiss (appears metamict); green crosshair on BSE image marks analysis location.

**PHOTOMICROGRAPH SAMPLE B-54**  
32.5 feet

**B-54 32.5':** This sample contains sheared porphyroclasts of feldspar (small example at center of photo), hosted in a matrix of recrystallized quartz ribbons, biotite, and accessory epidote, titanite, and zircon.

**PHOTOMICROGRAPH SAMPLE B-54**  
32.5 feet

**B-54 32.5':** This sample contains a small cluster of high-relief titanite and epidote within mica-defined foliation.

**B-54 32.5'**: False color SEM-EDS chemical map of Ca (blue) and Ti (purple) superimposed on BSE base image; element maps highlight the locations of Apatite (blue) and Titanite (violet) within this area of the sample.

**B-54 32.5'**: False color SEM-EDS chemical map of Ti (purple) and Zr (light green) superimposed on BSE base image; element maps highlight the locations of Titanite (purple) and Zircon (light green and small – note that due to co-location of Zr and P within the energy spectrum, larger apatites are also highlighted) within this area of the sample.

**PHOTOMICROGRAPH SAMPLE B-57**  
**44.0 feet**

**B-57 44.0'**: Poikiloblastic, anhedral garnet; matrix foliation defined by alignment of fine-grained micas wraps around garnet crystal.

**PHOTOMICROGRAPH SAMPLE B-57**  
**44.0 feet**

**B-57 44.0'**: Same garnet as above; cross-polarization. Possible alignment of quartz inclusions within garnet defines a fabric that is oblique to matrix foliation.

**B-57 44.0':** BSE (top) and EDS spectrum (bottom) of garnet core, green crosshair on BSE image marks analysis location.. Garnet composition is almandine-rich, with significant grossular and spessartine component.

**PHOTOMICROGRAPH SAMPLE B-57**  
**44.0 feet**

PPL (top) and XPL (bottom) of two anhedral, poikiloblastic garnets. Note increase in abundance of quartz and lack of micas in proximity of garnet, which may suggest local depletion of Al and other nutrients consumed during garnet-forming reaction.

**PHOTOMICROGRAPH SAMPLE B-57**  
**44.0 feet**

PPL image (5X magnification) of small (sub-mm) subhedral garnet poikiloblast. Note change in inclusion density from core-to-rim.

**PHOTOMICROGRAPH SAMPLE B-57**  
**50.5 feet**

PPL (top) and XPL (bottom) of mica "fish" in sheared button schist.

PHOTOMICROGRAPH SAMPLE B-57  
50.5 feet

Small (< 1 mm) garnet (center of photo).

B-57 50.5': 5X magnification image of garnet in previous image. Note high density of fine-grained inclusions (quartz, opaques) that appear to define a complex, rotated internal fabric. This suggests syndeformational growth of the garnet in this sample.

**B-57 50.5':** BSE and EDS spectrum of Epidote with allanite component (presence of LREE). Also note apparent sheared apatite (lower center-left) and Epidote (with LREE) rimmed by apatite (top-center). Other bright minerals in BSE include ilmenite, zircon, pyrite, and chalcopyrite.
