CERTIFICATION STATEMENT

This 2020 Semiannual Groundwater Monitoring and Corrective Action Report, Georgia Power Company - Plant McManus- Inactive Ash Pond 1 (AP-1) has been prepared in compliance with the United States Environmental Protection Agency coal combustion residual rule [40 Code of Federal Regulations (CFR) 257 Subpart D] and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with Resolute Environmental & Water Resources Consulting, LLC (Resolute).

SUMMARY

This summary of the 2020 Semiannual Groundwater Monitoring and Corrective Action Report provides the status of groundwater monitoring and corrective action program through January 2021 at Georgia Power Company's (Georgia Power's) Former Ash Pond (AP) AP-1 at Plant McManus (the Site). This summary was prepared by Resolute Environmental and Water Resources Consulting, LLC. (Resolute) on behalf of Georgia Power to meet the requirements listed in Part A, Section 6¹ of the U.S. Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D).

Plant McManus is located at 1 Crispin Island Dr. in Glynn County, Georgia, approximately 5.37 miles northwest of the city of Brunswick. The plant property is bordered by the Turtle River to the west and by Burnett Creek to the north. The former AP-1 is located on the northeastern portion of the plant property (Figure 1). The former AP-1 was an approximately 80-acre ash pond that was built in the late 1950's. Ash sluicing operations at AP-1 commenced in 1959 and ceased in 1972. Closure of AP-1 commenced in 2016. As part of closure, AP-1 was dewatered sufficiently to remove the free liquids, and ash was removed and disposed of in an offsite, permitted landfill. A certification of removal report demonstrating completion of removal activities was submitted to EPD on November 27, 2019. Based on review of the report and an inspection of AP-1 on December 13, 2019, EPD acknowledged the completion of CCR removal on January 10, 2020.

Figure 1. Former Ash Pond (AP-1) and Site.

Groundwater at the Site is monitored using a multi-unit monitoring system comprised of 16 wells: 8 upgradient, 3 sidegradient, 4 downgradient, and 1 vertical extent, that meet federal and state monitoring requirements. Initial monitoring wells were installed between June and September 2016. Additional monitoring wells were installed in October 2019 and March 2020. Routine sampling and reporting began after the background groundwater conditions were established between August 2016 and May 2018. Based on groundwater conditions at the Site, an assessment monitoring program and assessment of corrective measures were established on August 2019 and July 2020, respectively. An *Assessment of Corrective Measures Report* was subsequently prepared for the former AP-1 (Arcadis, 2020b) and submitted to GA EPD in December 2020. During the 2020 semiannual reporting period, the Site remained in assessment monitoring as corrective measures were evaluated.

During the 2020 semiannual reporting period, Resolute conducted two groundwater sampling events in August and October 2020 as well as a resampling event in January 2021. Groundwater

¹ 80 FR 21468, Apr. 17, 2015, as amended at 81 FR 51807, Aug. 5, 2016; 83 FR 36452, July 30, 2018; 85 FR 53561, Aug. 28, 2020

samples were submitted to Pace Analytical Services, LLC, for analysis. Per the CCR rule, groundwater results were evaluated in accordance with the certified statistical methods. That evaluation showed statistically significant values of Appendix III² and Appendix IV³parameters in wells provided in the table below.

Appendix III Parameter	October 2020
Boron	MCM-06, MCM-07, and MCM-17
Calcium	MCM-06, MCM-07
pH	MCM-05, MCM-06, MCM-07, MCM-12, MCM-14, and MCM-17
TDS	MCM-06, MCM-07, and MCM-14
Appendix IV Parameter	October 2020
Arsenic	MCM-06
Lithium	MCM-06

Based on review of the Appendix III and Appendix IV statistical results, the Site will continue in assessment monitoring. Georgia Power will continue routine groundwater monitoring and reporting at the Site. Reports will be posted to the website and provided to EPD semiannually.

² Boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS)

³ Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, selenium, thallium, and radium 226 + 228

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015) and the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management 391-3-4-.10, this *2020 Semiannual Groundwater Monitoring and Corrective Action Report* has been prepared to document groundwater monitoring activities conducted at Georgia Power Company's (Georgia Power's) Plant McManus Inactive Ash Pond AP-1 (the Site) and satisfy the requirements of § 257.90(e). To specify groundwater monitoring requirements, Georgia EPD rule 391-3-4-.10(6)(a) incorporates by reference the United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015). For ease of reference, the USEPA CCR rules are cited within this report.

Groundwater monitoring and reporting for the former AP-1 is performed in accordance with the monitoring requirements of 40 CFR 257.90 through 257.95 of the USEPA CCR rule, and Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6).

The former AP-1 ceased receiving waste prior to the effective date of the USEPA CCR rule promulgated in April 2015. A notification of intent to initiate closure of the inactive CCR ash pond was certified on December 7, 2015 and posted to Georgia Power's website. Therefore, groundwater monitoring and reporting for the former AP-1 are being completed in accordance with the alternate schedule in § 257.100(e)(5) of the revised USEPA CCR rule (August 5, 2016).

This report documents semiannual monitoring activities completed August 2020 through January 2021 (the reporting period) and includes the required report components in accordance with 40 CFR 257.90(e).

1.1 SITE LOCATION AND DESCRIPTION

The Site is located at 1 Crispen Island Dr. in Glynn County, Georgia, approximately 5.37 miles northwest of the city of Brunswick. The plant property is bordered by the Turtle River to the west and by Burnett Creek to the north. The former AP-1 is located on the northeastern portion of the plant property (Figure 1).

The former AP-1 was an approximately 80-acre ash pond that was built in the late 1950's. Ash sluicing operations at AP-1 commenced in 1959 and ceased in 1972. Closure of AP-1 commenced in 2016. As part of closure, AP-1 was dewatered sufficiently to remove the free liquids, and ash was removed and disposed of in an offsite, permitted landfill. A certification of removal report demonstrating completion of removal activities was submitted to EPD on November 27, 2019. Based on review of the report and an inspection of AP-1 on December 13, 2019, EPD acknowledged the completion of CCR removal on January 10, 2020.

1.1.1 Regional Geology

The Brunswick area is underlain by three regional aquifer systems which extend to depths exceeding 1,100 feet. The uppermost regional aquifer is the surficial aquifer. In the Brunswick area, this aquifer extends to a depth of approximately 180 feet. Although the surficial aquifer is defined on a regional scale as extending to approximately 180 feet below ground surface, Clarke and others (1990) acknowledge that localized lower permeability units can create confined or semi-confined conditions within limited areas of the surficial aquifer (ATC Associates Inc., 1997).

Regionally, the surficial aquifer is composed of geologic formations overlying the Hawthorn Formation. These formations include the Satilla, Charlton, and Raynor Formations, as well as undifferentiated Holocene, Pleistocene, Pliocene and late-Miocene deposits. In the Brunswick area, the Satilla is described as extending to approximately 28 feet below ground surface and the Cypresshead to approximately 50 feet below ground surface. Underlying the Satilla and Cypresshead Formations are sands, gravels, and clays which have been described by Weems and Edwards (2001) as two pairs of alternating confining units and water-bearing zones of the Ebenezer Formation. These alternating units of the Ebenezer Formation are described as an uppermost confining unit extending from approximately 50 to 75 feet below ground surface, followed by a water-bearing zone from approximately 75 to 110 feet below ground surface, another confining unit from approximately 110 to 15 feet below ground surface, and then another water-bearing zone from approximately 150 to 185 feet below ground surface. Depositionally, these sediments represent marginal to shallow marine beds, that are overlain by marine terrace deposits. Fluvial or residual deposits overlay the terrace deposits (Miller, 1986; Clarke et al, 1990).

The regional surficial aquifer is underlain by approximately 90 feet of lower-permeability portions (Miocene Unit A) of the Hawthorn Formation. This stratum forms the upper confining bed for the Brunswick aquifer system. The Brunswick aquifer system is composed of two confined aquifers (the Upper Brunswick aquifer and the Lower Brunswick aquifer) which are separated and confined above and below by less permeable units of the Hawthorn Formation. The Upper Brunswick aquifer extends from approximately 270 feet to 350 feet below ground surface, and the Lower Brunswick aquifer extends from approximately 400 feet to 470 feet below ground surface (Clarke et al, 1990).

1.1.2 Site Geology and Hydrogeology

Based on information collected during subsurface investigations, Plant McManus is underlain by very fine sands and clays from land surface (or beneath a shallow fill layer) to depths ranging from 33 to 43 feet below land surface. Very fine sands are predominant, but discontinuous clay layers of varying thickness were encountered during drilling activities. The clay layers varied from less than one inch to approximately ten feet in thickness. These very fine sands and discontinuous clay layers are interpreted to be the Upper Satilla Formation (ATC Associates, Inc., 1997).

Underlying the Upper Satilla Formation are fine to medium sands with greater silt content, and apparently lower permeability, than the sands of the Upper Satilla. These siltier sands, which were

interpreted to be the Lower Satilla Formation, were encountered at depths greater than 35 feet below ground surface during the Site investigation performed in the 1990s (ATC Associates Inc., 1997). These sands may also correspond to the Cypresshead Formation of Huddleston (1988). Sands and clays below the Cypresshead and above the confining unit of the Brunswick aquifer system have been described by Weems and Edwards (2001) as two pairs of alternating confining units and water-bearing zones of the Ebenezer Formation, extending from approximately 50 to 185 feet below ground surface in the Brunswick area.

The regional surficial aquifer that contains the Upper and Lower Satilla Formations is underlain by approximately 90 feet of lower-permeability portions (Miocene Unit A) of the Hawthorn Formation. This stratum forms the upper confining bed for the Brunswick aquifer system.

The surficial aquifer underlying the mainland, marsh, and island is composed of the very fine to fine grain sand with discontinuous clay layers of the Upper and Lower Satilla Formation. In the marsh, the groundwater elevation at low tide is below the top of the marsh surface. The upper portion of the aquifer in the marsh has been cut by tidal creeks, which meander through the marsh. In addition to current and historically recent (pre-ash pond construction) tidal channels, the marsh is also likely to have paleo (pre-historic) tidal channels present throughout the upper portion of the aquifer in the marsh area, which may provide zones of higher hydraulic conductivity or isolated pockets of groundwater. Vertically, the Satilla formation fines downward to a silty fine sand of the Lower Satilla Formation. The aquifer is generally unconfined, with localized clay layers. Groundwater flowing within the surficial aquifer is separated from deeper aquifers by approximately 90 feet of lower-permeability portions of the Hawthorn Formation (Miocene Unit A) that form the upper confining bed for the Brunswick aquifer system (Clarke et al, 1990).

Groundwater flows from two directions toward the former AP-1. One groundwater flow component originates on the mainland, northeast of the facility, and flows southwest, while the other flow component originates on Crispen Island and flows north and northeast (Figures 4 through 7). Groundwater elevations in the monitoring wells on the mainland (MCM-02, -15, and -16) and on the island (MCM-08, and -11) have consistently exhibited higher groundwater elevations than the monitoring wells and piezometers installed along the dikes (Table 4), with MCM-01 and -04 exhibiting intermediate elevations between the mainland and dike wells. The potentiometric surface of the surficial aquifer and the resultant groundwater flow direction in the vicinity of the former AP-1 is a reflection of the topography of the mainland, Crispen Island, and the tidal marsh surrounding the area.

1.2 GROUNDWATER MONITORING SYSTEM

Pursuant to § 257.91, Georgia Power installed a groundwater monitoring system within the uppermost aquifer around former AP-1. The monitoring system is designed to monitor groundwater passing the waste boundary of the former AP-1 within the uppermost aquifer. Wells were located to serve as piezometers, upgradient monitoring points, sidegradient monitoring points, or downgradient monitoring points based on groundwater flow direction (Tables 1 and 2, Figures 2 & 3). The compliance monitoring network for the former AP-1 currently consists of 15

monitoring wells. As part of the assessment monitoring program, deep piezometer DPZ-02 was reclassified as a delineation well during this 2020 semiannual monitoring period. Pursuant to § 257.195(g)(1)(iv), the wells, classified as “delineation wells”, are sampled in addition to the compliance monitoring wells as part of the ongoing assessment groundwater monitoring program.

2.0 GROUNDWATER AND SURFACE WATER MONITORING ACTIVITIES

As required by § 257.90(e), the following describes monitoring-related activities performed during the reporting period and discusses any change in status of the monitoring program.

2.1 MONITORING WELL INSTALLATION, MAINTENANCE, AND ABANDONMENTS

In summary, monitoring activities for this reporting period included:

- Visual inspection of well conditions prior to sampling, recording Site conditions, and performing exterior maintenance to perform sampling under safe and clean conditions;
- Redevelopment of older monitoring wells installed in 2016 as a part of scheduled maintenance; wells were redeveloped in August 2020 and included: MCM-01, -02, -04, -05, -06, -07, -11, -12, -14, -15, -16, and -17;
- Re-classifying deep piezometer DPZ-02 as a delineation well and incorporating it into the assessment monitoring well network in October 2020.

The August 2020 redevelopment logs for the selected monitoring wells are located in Appendix B. The location of the transitioned piezometer, DPZ-02, is shown on Figure 2. DPZ-02 is located adjacent to monitoring well MCM-06 on the northern dike and is screened at a depth of 35 to 40 feet below ground surface, placing it in the Cypresshead formation approximately 16 ft deeper than well MCM-06, which is screened from approximately 14 to 24 feet below ground surface.

2.2 ASSESSMENT MONITORING

Based on results of the August 2019 *Annual Groundwater and Corrective Action Monitoring Report*, assessment monitoring was initiated at the Site. Statistical analyses of the 2019 groundwater data identified SSLs of arsenic and lithium in well MCM-06 in excess of the federal and state groundwater protection standard (GWPS).

Pursuant to § 257.96, an Assessment of Corrective Measures Report (ACM) was initiated for the former AP-1 in July 9, 2020. An Alternative Source Demonstration (ASD) for lithium was prepared pursuant to regulations in § 257.95(g)(3)(ii) and described in Section 2.3 (Arcadis, 2020a). The ASD was submitted to GA EPD on November 17, 2020; a copy is also provided in Appendix D of this report for reference. An *Assessment of Corrective Measures Report* (ACM Report) was subsequently prepared for the former AP-1 (Arcadis, 2020b) and submitted to GA EPD in December 2020 and posted to the CCR compliance website in January 2021. In accordance with § 257.96(b), groundwater continues to be monitored at the former AP-1 under the assessment monitoring program while the ACM phase is implemented.

Pursuant to § 257.95(b), the 15 monitoring wells of the certified compliance monitoring network (Figure 2) were sampled for the full suite of Appendix IV constituents in August 2020 as the initial assessment monitoring event. Following receipt of the initial Appendix IV sample results, the October 2020 semiannual assessment monitoring event was conducted. In October 2020, DPZ-02 was sampled and included in the assessment monitoring event as a vertical delineation well to assess the extent of arsenic at former AP-1. Sixteen wells were sampled and analyzed for Appendix III constituents and the following Appendix IV constituents that were detected during the August 2020 event: arsenic, barium, beryllium, cobalt, lead, lithium, combined radium 226/228, and selenium. In addition, resampling of monitoring well MCM-05 was performed in January 2021. The sequence of monitoring events conducted at the former AP-1 in 2020 is summarized in Table 3. Details of these events and analytical results are discussed in Section 3, while the statistical results are discussed in Section 4.

2.3 ALTERNATE SOURCE DEMONSTRATION

In pursuant to regulations in § 257.95(g)(3)(ii), Arcadis U.S., Inc. (Arcadis) prepared an ASD for the SSLs of lithium reported for well MCM-06. The ASD presents multiple lines of evidence that indicate that the lithium observed at former AP-1 is due to a natural source – i.e., the influx of brackish surface water during dewatering activities. Lithium is a naturally occurring element in seawater and is present in the brackish water that is a mix of seawater and freshwater surrounding the site. The following analyses are presented to support this ASD:

1. Evaluation of lithium concentrations in surface waters. This evaluation demonstrates that the range of lithium concentrations observed in surface water is comparable to the range of lithium concentrations observed at MCM-06.
2. Comparison of geochemistry markers in surface waters and groundwater. This comparison demonstrates that the monitoring wells where lithium is present in groundwater yield similar geochemistry to each other and the surface water, while being distinct from groundwater in monitoring wells with low estimated or non-detect lithium.
3. Variation in hydraulic conductivity and response to tidal fluctuations. This data shows that locations such as MCM-06 are in hydraulic communication with the tidal marsh.
4. Evaluation of groundwater flow conditions and concentration trends during CCR removal. Dewatering associated with CCR removal resulted in a consistent inward lateral gradient during high and low tides. The dewatered inward flow conditions correlate with a shift in groundwater quality at several monitoring wells, including MCM-06, toward the geochemistry of the surface water.

Combined, these lines of evidence demonstrate that the former CCR unit is not the source of lithium SSLs observed in well MCM-06. The ASD was provided in Appendix D of this report for reference.

2.4 ADDITIONAL SAMPLING EVENTS

Additional groundwater and surface water sampling events were performed during the reporting period to supplement existing groundwater data collected through previous assessment events and to further investigate the nature and the extent of parameters detected on Site.

2.4.1 Surface Water Sampling

Due to the presence of surface water adjacent to MCM-06, installation of wells to horizontally characterize this area is infeasible. Georgia Power proactively collected surface water samples from along four transects (T1 through T4) in the tidal marsh adjacent to wells MCM-05, MCM-06, MCM-07, and MCM-14, respectively, in October and November 2020⁴ during both high (HT, HTS, HS, HB) and low tides (L, LT). In addition, samples from the surface water in the former ash pond were collected adjacent to MCM-05, MCM-06, MCM-07 and MCM-14. Samples were also collected from two background locations. One background surface water location sampled was the low tide background location, BG-1LT, in Cowpen Creek, north of its confluence with Burnett Creek. The other surface water sample was collected at high tide from background location 2, or BG-2HT, located in the Turtle River, north of its confluence with Gibson Creek. Samples were collected from locations shown in Figures 8-10. Surface water samples are collected in accordance with USEPA Region 4 *Science and Ecosystem Support Division (SESD), Operating Procedure, Surface Water Sampling SESDPROC-201-R4* (December 16, 2016).

Surface water data will be collected for Appendix III parameters and arsenic semiannually with routine groundwater sampling and reported in semiannual and annual groundwater monitoring reports. Additional parameters were added during this reporting period to the surface water analyses to develop additional data for the ASD described in Section 2.3 and provided in Appendix D of this report for reference. The results for the October and November 2020 events are summarized in Table 5. The laboratory reports associated with the sampling event are provided in Appendix C. Georgia Power will continue collecting the surface water samples semiannually.

2.4.2 Additional Characterization of Groundwater Parameters on the Northern Dike

Additional groundwater sampling was performed in October 2020 along the northern dike to develop additional data in support of assessment of corrective measures (ACM). Samples were collected from monitoring wells, MCM-05, -06, -07, -14; deep piezometer DPZ-02; and the 10 former dewatering wells located on the northern dike (RW-1 through RW-10). Groundwater was analyzed for dissolved and total metals (arsenic, iron, and manganese), nitrate, sulfate, sulfide, TOC, BOD, orthophosphate, alkalinity (carbonate and bicarbonate), boron, TDS, cations (magnesium, calcium, sodium, and potassium), anions (chloride), and arsenic speciation (As [III], As [V], MMAAs, DMAAs, and sum of unknown arsenic species). The scope, sampling methodologies, and results of this event are presented in the Semi-Annual Remedy Selection and Design Progress Report prepared by Arcadis U.S., Inc. for Georgia Power in Appendix D.

⁴ A November 2020 resampling event was conducted to replace the samples that were lost due to the shipping mishap; the full parameter suite was resampled, including metals.

3.0 SAMPLE METHODOLOGY & ANALYSES

The following sections describe the methods used to conduct groundwater and surface water monitoring as well as the sampling results that were obtained from sampling events at the former AP-1 during August 2020 through January 2021.

3.1 GROUNDWATER ELEVATION MEASUREMENT

Prior to each sampling event, groundwater levels were recorded from piezometers and wells in the network at the former AP-1. Groundwater measurements were taken from transducers installed in 16 wells (MCM-01, -02, -04 through -07, -11, -12, -14 through -20, and DPZ-02) and 8 piezometers (MCM-03, -08, -13, DPZ-01, and DPZ-03 through -06). The remaining piezometers in the network were gauged by hand using a Heron water level indicator. Groundwater elevations calculated during the August and October 2020 monitoring events are summarized in Table 4. Groundwater elevation data were used to develop a high tide and low tide potentiometric surface elevation contour map for each event (Figures 4-7). Groundwater flow at the Site is discussed in Section 1.1.

3.2 GROUNDWATER GRADIENT AND HORIZONTAL FLOW VELOCITY

The horizontal groundwater flow velocity at the former AP-1 was calculated using a derivation of Darcy's Law. Specifically,

$$V = \frac{K * i}{\eta_e}$$

Where:

V = Groundwater flow velocity ($\frac{\text{feet}}{\text{day}}$)

K = Average Hydraulic Conductivity ($\frac{\text{feet}}{\text{day}}$)

i = Horizontal hydraulic gradient ($\frac{\text{feet}}{\text{foot}}$)

η_e = Effective porosity

Horizontal groundwater flow velocities were calculated for two well pairs at high and low tide using groundwater elevations collected from transducers on October 14, 2020. Groundwater flow velocities representing groundwater flowing from the mainland to former AP-1 (between MCM-02

and MCM-16) and from the island to former AP-1 (between MCM-11 and MCM-12) increased slightly during high tide compared to low tide (Table 6). Groundwater flow between MCM-02 and MCM-16 was 0.0606 ft/ day at low tide and 0.0610 ft/ day at high tide, while groundwater flow for MCM-11 and MCM-12 was 0.0506 ft/ day at low tide and 0.0527 ft/day at high tide. The groundwater direction during high tide was from the marsh to former AP-1 and at low tide from former AP-1 to the marsh. Average groundwater flow velocities were 0.057 ft/day or 20.74 feet per year (ft/year) at high tide and 0.056 ft/day or 20.30 ft/yr at low tide.

3.3 GROUNDWATER SAMPLING

Groundwater samples were collected from the compliance well network and select piezometers using low-flow sampling procedures in accordance with § 257.93(a). Purging and sampling was performed using a peristaltic pump with the intake tubing lowered to the midpoint of the well screen (or as appropriate determined by the water level). QED dedicated pumps are utilized in monitoring wells MCM-01, MCM-05, MCM-06, MCM-07, MCM-12, MCM-14, MCM-15, MCM-16, and MCM-17. Non-disposable equipment was decontaminated before use and between well locations.

An AquaTroll (In-Situ field instrument) was used to monitor and record field water quality parameters (pH, conductivity, dissolved oxygen (DO), temperature, and oxidation reduction potential [ORP]) during well purging to verify stabilization prior to sampling. Turbidity was monitored using a LaMotte 2020we (or similar) 1970-USEPA and ISO Compliant Model turbidity meter.

Groundwater samples were collected when the following stabilization criteria were met:

- ± 0.1 standard units for pH
- $\pm 5\%$ for specific conductance
- ± 0.2 milligrams per liter (mg/L) or $\pm 10\%$, whichever is greater for DO > 0.5 mg/L. No criterion applies if DO < 0.5 mg/L, record only
- Turbidity measurements less than or equal to 10 nephelometric turbidity units (NTU)

Once stabilization was achieved, unfiltered samples were collected in appropriately preserved laboratory-supplied containers, placed in ice-packed coolers.

Upon completion of the sampling events, samples were submitted to Pace Analytical Services, LLC (Pace) following chain-of-custody protocol. The field sampling forms generated during the assessment monitoring events conducted during August through January 2021 are included in Appendix A.

3.4 LABORATORY ANALYSES

Laboratory analyses were performed by Pace, which is accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintains a NELAP certification for all Appendix III and Appendix IV constituents analyzed for this project.

The groundwater analytical results from the initial assessment event conducted in August 2020, the semiannual assessment monitoring event conducted in October 2020, and the resample event conducted in January 2021 are summarized in Table 7. The Pace laboratory analytical reports are provided in Appendix A. The pH field measurements recorded during the sampling events are also provided in Table 7.

3.5 QUALITY ASSURANCE AND QUALITY CONTROL

During each sampling event, quality assurance/quality control samples (QA/QC) were collected at a rate of one sample per every 10 detection samples. QA/QC samples included field equipment rinsate blanks (EQBL), field blanks (FBL), and duplicate (DUP) samples. QA/QC sample data were evaluated during data validation (as described below) and are included in Appendix A and C.

Groundwater quality data for the assessment events were independently validated in accordance with USEPA guidance (USEPA, 2011) and the analytical methods. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences (RPDs), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits. Where appropriate, validation qualifiers and flags are applied to the data using USEPA procedures as guidance (USEPA, 2017). Based on the data validation reports, the data collected during August and October 2020 are acceptable for use in determining the compliance status of the Site. The associated data validation report is provided in Appendix A with the laboratory reports.

4.0 STATISTICAL ANALYSIS

Statistical analysis of the reporting period groundwater monitoring data was performed by Groundwater Stats Consulting, LLC (GSC), following the appropriate certified statistical methodology for the Site. The report generated from the statistical analysis is provided in Appendix F (GSC, 2020). A summary of methods and results are provided in the following sections.

4.1 METHODS

The statistical method used at the Site was developed by GSC using methodology presented in Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance, March 2009, US EPA 530/ R-09-007 (US EPA, 2009). To develop the statistical methods, analytical data collected during the background period were evaluated and used to develop statistical limits for each

Appendix III parameter and metals required by the existing EPD permit. Sanitas groundwater statistical software was used to screen the data and perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by US EPA regulations.

Appendix III statistical analysis was performed to determine if Appendix III constituents have returned to background levels. Appendix IV constituents were evaluated to determine if concentrations statistically exceeded the established state and federal GWPS. Detailed statistical methods used for Appendix III and Appendix IV constituents are discussed in statistical analysis package provided in Appendix F and summarized in Sections 4.1.1 and 4.1.2.

4.1.1 Appendix III Constituents

The statistical test used to evaluate the groundwater monitoring data was the interwell prediction limit (PL) method for Appendix III constituents (boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids [TDS]) combined with the option of a 1-of-2 verification resampling strategy. Interwell prediction limits, constructed from all available pooled upgradient well data were used to evaluate the most recent compliance sample from each downgradient well reported during the October 2020 sample event.

If data from a sampling event initially exceed the PL, the resampling strategy may be used to verify the result. In 1-of-2 resampling, one independent resample may be collected and evaluated within 90 days to determine whether the initial exceedance is verified. If the resample exceeds the PL, the initial exceedance is verified and an SSI is determined. When the resample result does not verify the initial result, there is no SSI. If resampling is not performed, the initial exceedance is a confirmed exceedance.

4.1.2 Appendix IV Constituents

Background limits were used when determining the Appendix IV GWPS under USEPA rule 40 CFR § 257.95(h) and GA EPD CCR Rule 391-3-4-.10(6)(a). Parametric tolerance limits were used to calculate background limits from pooled upgradient well data when data followed a normal or transformed-normal distribution for Appendix IV parameters with a target of 95% confidence and 95% coverage. When data contained greater than 50% non-detects or when the data distribution did not follow a normal or transformed-normal distribution, a nonparametric tolerance limit was used. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples.

USEPA revised the federal CCR Rule on July 30, 2018, updating GWPS for cobalt, lead, lithium, and molybdenum. As described in 40 CFR § 257.95(h)(1-3), the GWPS is:

- (1) The maximum contaminant level (MCL) established under 40 CFR §141.62 and 141.66.
- (2) Where an MCL has not been established:
 - (i) Cobalt 0.006 mg/L;
 - (ii) Lead 0.015 mg/L;
 - (iii) Lithium 0.040 mg/L; and

- (iv) Molybdenum 0.100 mg/L.
- (3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

USEPA's updated GWPS have not yet been incorporated under GA EPD's CCR Rule. The GA EPD CCR Rule GWPS is:

- (1) The federally established MCL.
- (2) Where an MCL has not been established, the background concentration.
- (3) Background levels for constituents where the background level is higher than the MCL.

Following the above federal and state rule requirements, GWPS were established for statistical comparison of Appendix IV constituents and are presented in Tables 8 and 9.

4.2 STATISTICAL ANALYSES RESULTS

Based on review of the full Appendix III statistical analysis discussion presented in Appendix E, groundwater conditions have not returned to background and assessment monitoring should continue. Review of the Sanitas results indicates that using the GWPS established according to both 40 CFR §257.95(h) and 391-3-4-.10(6)(a), the following SSLs were identified:

- Arsenic: MCM-06
- Lithium: MCM-06

A groundwater exceedance notification has been placed in the operating record pursuant to 40 CFR § 257.95(g). The lithium SSL in MCM-06 in excess of the state and federal GWPS is addressed with the ASD included in Appendix D and was submitted to Georgia EPD on November 17, 2020.

4.2.1 Delineation Data

Delineation well, DPZ-02, installed to assess the extent of arsenic in groundwater at former AP-1, shows that arsenic is vertically delineated at MCM-06. As described in Section 2.3.1, due to the presence of a surface water feature in the downgradient direction of MCM-06, installation of wells to horizontally characterize this area is infeasible. Georgia Power proactively collected surface water samples from along four transects in the tidal marsh adjacent to wells MCM-05, MCM-06, MCM07, and MCM-14 of former AP-1. The surface water sample results for arsenic from the transects are below the Georgia instream water quality standard chronic standard for dissolved arsenic (0.036 mg/L) for marine estuary environments (Table 5). Based on arsenic results for data collected to date, no arsenic impacts to surface water have been detected.

5.0 MONITORING PROGRAM STATUS

5.1 ASSESSMENT MONITORING STATUS

Pursuant to 40 CFR 257.96(b), Georgia Power will continue to monitor the groundwater at the former AP-1 in accordance with the assessment monitoring program regulations of 40 CFR 257.95 while ACM efforts are implemented to evaluate SSL concentrations of arsenic. Pursuant to § 257.94(e)(1), Georgia Power will continue assessment monitoring in accordance with § 257.95. Pursuant to § 257.95(g)(1)(iv), the delineation wells will continue to be sampled as part of the ongoing semiannual assessment groundwater monitoring program.

5.2 ASSESSMENT OF CORRECTIVE MEASURES

An ACM was implemented on July 9, 2020 and submitted to EPD on December 4, 2020. The ACM efforts completed during the reporting period covered by this groundwater monitoring and corrective action report are presented in the *Semiannual Remedy Selection and Design Progress Report* provided in Appendix E. The Semiannual Progress Report summarizes:

- (i) the current conceptual site model applicable to evaluating groundwater corrective measures proposed in the ACM Report (Arcadis, 2020b);
- (ii) the analytical data obtained during supplemental ACM-specific field investigations;
- (iii) the status of evaluating applicable corrective measures; and
- (iv) the planned activities and anticipated schedule for the following semiannual reporting period.

Georgia Power will include future Semiannual Progress Reports with each groundwater monitoring and corrective action report.

6.0 CONCLUSIONS & FUTURE ACTIONS

This 2020 *Semiannual Groundwater Monitoring and Corrective Action Report for Georgia Power's Plant McManus Inactive Ash Pond AP-1* was prepared to fulfill the requirements of USEPA's CCR Rule and Georgia EPD rule 391-3-4-.10(6)(c). Statistical evaluations of the groundwater monitoring data from August 2020 through January 2021 at the former AP-1 identified the continued presence of an SSL of arsenic and lithium in monitoring well MCM-06. The lithium SSL in MCM-06 is addressed with an ASD prepared pursuant to regulations in § 257.95(g)(3)(ii) and submitted to Georgia EPD on November 17, 2020 (Arcadis, 2020a). The arsenic SSL in MCM-06 is vertically delineated below the state and federal GWPS by DPZ-02. Based on the surface water data collected to date, the arsenic SSL in MCM-06 does not show impacts in adjacent surface water. Surface water data will be collected semiannually with routine groundwater sampling and reported in semiannual and annual groundwater monitoring reports.

Georgia Power will continue to monitor groundwater in the vicinity of former AP-1 under the current assessment monitoring program and adaptively manage the Site as new data become available. Georgia Power will continue efforts to assess corrective measures as presented in the *Semiannual Remedy Selection and Design Progress Report* provided in Appendix E.

The 2nd semiannual assessment sampling event is planned for March 2021.

Notes:

1. Results for substances (except radium) are reported in milligrams per liter (mg/L). Radium results are reported in picocuries per liter (pCi/L)

2. < indicates the substance was not detected above the analytical Method Detection Limit (MDL)

3. J - Estimated value. Substance was detected above the MDL and below the laboratory's Reporting Limit (RL).

4. U - Estimated value for radium. Substance was detected below the Minimum Detection Concentration (MDC).

5. TDS - Total Dissolved Solids

6. Appendix III = indicator parameters evaluated during Detection Monitoring; Appendix IV = parameters evaluated during Assessment Monitoring

7. Blank values indicate the parameter was not analyzed

8. pH - Parameter measured in the field

9. pH results reported in standard units (SU)

Groundwater Protection Standards from Appendix F- Groundwater Stats Consulting, February 2021

Notes:

mg/L = milligram per liter;

pCi/L = picocuries per liter;

n/a = Not Available;

MCL = Maximum Contaminant Level;

RSL = Rule Specified Limit (Not yet adopted by EPD)

[1] The background limits are used when determining the groundwater protection standard (GWPS) under 40 CFR § 257.95 (h) and Georgia Environmental Protection Division (EPD) Rule 391-3-4-.10(6)(a).

[2] Under 40 CFR § 257(h)(1-3) the GWPS is: (i) the MCL, (ii) where the MCL is not established, the background concentration, or (iii) background levels for constituents where the background level is higher than the MCL or rule specified GWPS.

RE: Project: MCMANUS ASH POND SCAN
Pace Project No.: 92493014

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on August 28, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,

without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: MCMANUS ASH POND SCAN
Pace Project No.: 92493014

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- E Analyte concentration exceeded the calibration range. The reported result is estimated.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- R1 RPD value was outside control limits.

RE: Project: MCMANUS ASH POND SCAN RADS
Pace Project No.: 92493016

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on August 28, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: MC MANUS ASH POND SCAN RADS
Pace Project No.: 92493016

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: MCMANUS CCR
Pace Project No.: 92500314

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between October 14, 2020 and October 16, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

Pace Project No.: 92500314

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- D6 The precision between the sample and sample duplicate exceeded laboratory control limits.
M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: MCMANUS CCR RADS
Pace Project No.: 92500310

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between October 14, 2020 and October 16, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:
• Pace Analytical Services - Greensburg

Revision 1 - This report replaces the November 6, 2020 report. This project was revised on November 30, 2020 to reflect correction of Lab ID's. (Greensburg, PA)

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: MCMANUS CCR RADS
Pace Project No.: 92500310

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: PLANT MCMANUS CCR
Pace Project No.: 92514770

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on January 05, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

QUALIFIERS

Project: PLANT MCMANUS CCR

Pace Project No.: 92514770

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- | | |
|----|---|
| M1 | Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery. |
| M6 | Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution. |

RE: Project: PLANT MCMANUS CCR RADS
Pace Project No.: 92514705

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on January 05, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: PLANT MCMANUS CCR RADS

Pace Project No.: 92514705

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

Setting the Standards for Innovative Environmental Solutions

**Stage 2A Data Verification Report
Georgia Power
McManus Fossil Plant
Coal Combustion Residuals Project
Groundwater Samples**

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the 15 groundwater samples collected as part of the August 2020 Ash Pond Scan sampling at the Georgia Power McManus Fossil Plant facility. These samples were collectively analyzed by Pace Analytical Services, LLC (Pace) in Asheville, North Carolina (Pace Asheville) and Huntersville, North Carolina (Pace Charlotte) for total metals by SW-846 Method 6010D and 6020B; for mercury by SW-846 Method 7470A; for total dissolved solids (TDS) by Standard Method (SM) 2540C; and for anions (specifically, chloride, fluoride, and sulfate) by US EPA Method 300.0. In addition, these samples were collectively analyzed by Pace of Greensburg, Pennsylvania (Pace Pittsburgh), for total radium-226 by SW-846 Method 9315, for total radium-228 by SW-846 Method 9320, and for combined radium-226+228 by calculation.

This review was performed with guidance from the US EPA Region IV Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (November 2001); the US EPA Region IV Data Validation Standard Operating Procedures (SOPs; US EPA Region IV, September 2011); and the applied analytical methods. These validation guidance documents, with the exception of the analytical methods, specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the SM, SW-846, and US EPA methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the SM, SW-846, and US EPA methods utilized by the laboratory.

Summary

The analytical results and associated laboratory quality control (QC) samples were reviewed to determine the integrity of the reported analytical results and to verify that the data met the established data quality objectives.

The samples collected on 8/26/2020 were evaluated as part of this QA review.

The following samples were evaluated as part of this QA review: MCM-01, MCM-02, MCM-04, MCM-05, MCM-06, MCM-07, MCM-11, MCM-12, MCM-14, MCM-15, MCM-16, MCM-17, MCM-18, MCM-19, and MCM-20.

The following Pace inorganic SDG was evaluated as part of this QA review: 92493014.

The following Pace radiological SDG was evaluated as part of this QA review: 92493016.

All data are considered usable as reported, or usable after integration of data validation qualifications.

Inorganic and Radiological Data Review

Data validation was performed for these samples based on the sample results, summary QC data, and raw data provided by the laboratory. The findings offered in this report for the inorganic analyses are based upon a review of the following QC measures:

- Sample condition upon laboratory receipt
- Chain-of-Custody (COC) Records
- Blank analysis results
- Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recoveries
- Laboratory duplicate precision
- Sample holding times
- Case Narratives
- Chemical yield
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision
- Field duplicate precision

The above QC measures were evaluated against the analytical method requirements and QC acceptance criteria. The data were validated based on guidance from the US EPA Region IV Data Validation SOPs, the referenced procedures, and were qualified as appropriate as described in the sections below.

Comments and Exceptions

1. In all SDGs, the laboratory did not provide a Case Narrative associated with the inorganic and radiological analyses. As this item was not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
2. In SDG 92493014, the laboratory did not provide the subcontracted COC Record or the Sample Login Receipt Checklist from Pace Asheville to Pace Charlotte. As these items were not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
3. In SDG 92493016, the laboratory did not provide the subcontracted COC Record or the Sample Login Receipt Checklist from Pace Asheville to Pace Pittsburgh. As these items were not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
4. In the anion fraction of SDG 92493014, the laboratory performed matrix QC (MS/MSD) analyses on an equipment blank. Matrix QC analyses are performed to evaluate the impact of matrix interferences on target analyte results in investigative samples, which would not be present in an equipment blank sample. The data reviewer evaluated the MS/MSD analyses performed on the field blank and equipment blank as an LCS/LCSD analysis.
5. In the metals fraction of SDG 92493014, the reported recovery concentration of boron in the MS/MSD was reported as ND. Due to the LIMS limitation the percent recovery is calculated using the on-instrument concentration. The boron recovery listed as ND, indicates the percent recovery is 0%; however, the parent sample was diluted twenty-

fold, raising the sample's MDL. As a result, boron was spiked in the MS/MSD below the sample-specific MDL. Qualification due to this issue was not warranted.

6. The data validator applied qualification to combined radium-226+228 based upon the QC samples associated with the analyses of the individual isotopes, radium-226 and radium-228. The electronic data deliverable (EDD) and the database only include the laboratory results for the combined radium-226+228; therefore, qualification of the individual isotopes is not addressed in this QA review.
7. SW-846 Method 9315 includes all alpha-emitting isotopes of radium. In order to analyze for only radium-226, a 21-day ingrowth period must be used. The radium-226 reported by the laboratory did not undergo a 21-day ingrowth; therefore, the results reported as radium-226 potentially contain additional alpha-emitting radium isotopes and could be high biased.
8. Combined radium-226+228 was reported as the summation of the calculated activities for radium-226 and radium-228. As consistent with routine radiological reporting conventions, negative activities were reported for the radium-226 and radium-228 analyses; however, all negative activities were entered as zero in the calculation of combined radium-226+228 activity.
9. The combined radium-226+228 sample-specific minimum detectable concentration (MDC) was reported as the summation of the MDCs for radium-226 and radium-228. Consequently, there may be instances where a detection was observed in one of the individual isotopes but the combined radium-226+228 result was reported as "not-detected" due to the laboratory's reporting convention for combined radium-226+228.
10. The combined radium-226+228 result uncertainty was reported as the summation of the calculated uncertainties for radium-226 and radium-228. If routine statistical uncertainty reporting conventions were followed, the result uncertainty would have been reported as the root sum square (RSS; the square root of the sum of the squared individual uncertainties).
11. The laboratory did not flag results < the MDC as "not-detected" in the data package provided. The data validator qualified these samples as "U" on the data tables.
12. The following field duplicate pairs (see table) were submitted and analyzed for inorganic and radiological parameters with this data set. Acceptable precision and sample representativeness were demonstrated by the reported results in the field duplicate pair evaluation (the relative percent difference [RPD] between results was $\leq 20\%$ when both results were $\geq 5\times$ the reporting limit [RL], the difference between results was \leq the RL when at least one result was $< 5\times$ the RL, or replicate error ratio [RER] < 3).

<u>Laboratory SDG(s)</u>	<u>Sample</u>	<u>Field Duplicate</u>

INORGANIC DATA QUALIFIERS

- U** - The analyte was analyzed for, but was not detected above the level of the reported sample reporting/method detection limit.
- U*** - This analyte should be considered "not-detected" because it was detected in an associated blank at a similar level.
- UJ** - The analyte was analyzed for, but was not detected above the level of the reported sample reporting/method detection limit. The reported method detection limit is approximate and may be inaccurate or imprecise.
- J** - The analyte was positively identified but the result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- R** - The data are unusable. The sample results are rejected due to serious analytical deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.
- UR** - The analyte was analyzed for, but was not detected above the level of the reported sample reporting or method detection; however, the data are unusable. The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The analyte may or may not be present in the sample.

Reason Codes and Explanations

Reason Code	Explanation
BE	Equipment blank contamination. The result should be considered "not-detected."
BF	Field blank contamination. The result should be considered "not-detected."
BL	Laboratory blank contamination. The result should be considered "not-detected."
BN	Negative laboratory blank contamination.
C	Initial and/or continuing calibration issue, indeterminate bias.
C+	Initial and/or continuing calibration issue. The result may be biased high.
C-	Initial and/or continuing calibration issue. The result may be biased low.
FD	Field duplicate imprecision.
FG	Total versus dissolved imprecision.
H	Holding time exceeded.
I	Internal standard recovery outside of acceptance limits.
L	LCS and LCSD recoveries outside of acceptance limits, indeterminate bias.
L+	LCS and/or LCSD recoveries outside of acceptance limits. The result may be biased high.

Setting the Standards for Innovative Environmental Solutions

**Stage 2A Data Verification Report
Georgia Power
McManus Fossil Plant
Coal Combustion Residuals Project
Groundwater Samples**

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the 16 groundwater samples collected as part of the October 2020 Semi-Annual Sampling at the Georgia Power McManus Fossil Plant facility. These samples were collectively analyzed by Pace Analytical Services, LLC (Pace) in Asheville, North Carolina (Pace Asheville) for total metals by SW-846 Method 6010D and 6020B; for mercury by SW-846 Method 7470A; for total dissolved solids (TDS) by Standard Method (SM) 2540C; and for anions (specifically, chloride, fluoride, and sulfate) by US EPA Method 300.0.

This review was performed with guidance from the US EPA Region IV Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (November 2001); the US EPA Region IV Data Validation Standard Operating Procedures (SOPs; US EPA Region IV, September 2011); and the applied analytical methods. These validation guidance documents, with the exception of the analytical methods, specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the SM, SW-846, and US EPA methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the SM, SW-846, and US EPA methods utilized by the laboratory.

Summary

The analytical results and associated laboratory quality control (QC) samples were reviewed to determine the integrity of the reported analytical results and to verify that the data met the established data quality objectives.

The samples collected on 10/12/2020 through 10/15/2020 were evaluated as part of this QA review.

The following samples were evaluated as part of this QA review: MCM-01, MCM-02, MCM-04, MCM-05, MCM-06, MCM-07, MCM-11, MCM-12, MCM-14, MCM-15, MCM-16, MCM-17, MCM-18, MCM-19, MCM-20, and DPZ-2.

The following Pace inorganic SDG was evaluated as part of this QA review: 92500314.

All data are considered usable as reported, or usable after integration of data validation qualifications.

Inorganic Data Review

Data validation was performed for these samples based on the sample results, summary QC data, and raw data provided by the laboratory. The findings offered in this report for the inorganic analyses are based upon a review of the following QC measures:

- Sample condition upon laboratory receipt
- Chain-of-Custody (COC) Records
- Blank analysis results
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries and precision
- Field duplicate precision
- Sample holding times
- Case Narratives
- Laboratory control sample (LCS) recoveries
- Laboratory duplicate precision

The above QC measures were evaluated against the analytical method requirements and QC acceptance criteria. The data were validated based on guidance from the US EPA Region IV Data Validation SOPs, the referenced procedures, and were qualified as appropriate as described in the sections below.

Comments and Exceptions

1. In SDG 92500314, the laboratory did not provide a Case Narrative associated with the inorganic analyses. As this item was not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
2. In SDG 92500314, the laboratory did not provide the subcontracted COC Record or the Sample Login Receipt Checklist from Pace Asheville to Pace Charlotte. As these items were not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
3. In the anion fraction of SDG 92500314, the laboratory performed matrix QC (MS/MSD) analyses on an equipment blank. Matrix QC analyses are performed to evaluate the impact of matrix interferences on target analyte results in investigative samples, which would not be present in a field or equipment blank sample. The data reviewer evaluated the MS/MSD analyses performed on the equipment blank as an LCS/LCSD analysis.
4. The following field duplicate pairs (see table) were submitted and analyzed for inorganic parameters with this data set. Acceptable precision and sample representativeness were demonstrated by the reported results in the field duplicate pair evaluation (the relative percent difference [RPD] between results was $\leq 20\%$ when both results were $\geq 5\times$ the reporting limit [RL], the difference between results was \leq the RL when at least one result was $< 5\times$ the RL).

<u>Laboratory SDG(s)</u>	<u>Sample</u>	<u>Field Duplicate</u>
92500314	MCM-11	DUP-1
92500314	MCM-16	DUP-2

Overall Assessment of Data

Based on a review of the data, qualification of data was warranted as noted below.

<u>Laboratory SDG(s)</u>	<u>Sample(s)</u>	<u>Analyte(s)</u>	<u>Qualifier</u>	<u>Reason(s) for Qualification</u>
92500314	MCM-17, MCM-19, and MCM-20	barium	J	M+ - High MS recovery
92500314	MCM-17, MCM-19, and MCM-20	selenium	J/UJ	M- - Low MS/MSD recoveries

- All inorganic positive results reported between the method detection limit (MDL) and RL have been flagged "J".

Report prepared by: Abigail Bossbaly M.S., Quality Assurance Chemist

Setting the Standards for Innovative Environmental Solutions

**Stage 2A Data Verification Report
Georgia Power
McManus Fossil Plant
Coal Combustion Residuals Project
Groundwater Samples**

This quality assurance (QA) review is based upon an examination of the data generated from the analyses of the 16 groundwater samples collected as part of the October 2020 semi-annual sampling at the Georgia Power McManus Fossil Plant facility. These samples were collectively analyzed by Pace of Greensburg, Pennsylvania (Pace Pittsburgh), for total radium-226 by SW-846 Method 9315, for total radium-228 by SW-846 Method 9320, and for combined radium-226+228 by calculation.

This review was performed with guidance from the US EPA Region IV Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (November 2001); the US EPA Region IV Data Validation Standard Operating Procedures (SOPs; US EPA Region IV, September 2011); and the applied analytical methods. These validation guidance documents, with the exception of the analytical methods, specifically address analyses performed in accordance with the Contract Laboratory Program (CLP) analytical methods and are not completely applicable to the type of analyses and analytical protocols performed for the SW-846 methods utilized by the laboratory for these samples. Environmental Standards, Inc. (Environmental Standards) used professional judgment to determine the usability of the analytical results and compliance relative to the SW-846 methods utilized by the laboratory.

Summary

The analytical results and associated laboratory quality control (QC) samples were reviewed to determine the integrity of the reported analytical results and to verify that the data met the established data quality objectives.

The samples collected 10/12/20 through 10/15/20 were evaluated as part of this QA review.

The following samples were evaluated as part of this QA review: MCM-01, MCM-02, MCM-04, MCM-05, MCM-06, MCM-07, MCM-11, MCM-12, MCM-14, MCM-15, MCM-16, MCM-17, MCM-18, MCM-19, MCM-20, and DPZ-2.

The following Pace radiological SDG was evaluated as part of this QA review: 92500310.

All data are considered usable as reported, or usable after integration of data validation qualifications.

Radiological Data Review

Data validation was performed for these samples based on the sample results, summary QC data, and raw data provided by the laboratory. The findings offered in this report for the inorganic analyses are based upon a review of the following QC measures:

- Sample condition upon laboratory receipt
- Chain-of-Custody (COC) Records
- Blank analysis results
- Laboratory control sample (LCS) recoveries
- Laboratory duplicate precision
- Sample holding times
- Case Narratives
- Chemical yield
- Field duplicate precision

The above QC measures were evaluated against the analytical method requirements and QC acceptance criteria. The data were validated based on guidance from the US EPA Region IV Data Validation SOPs, the referenced procedures, and were qualified as appropriate as described in the sections below.

Comments and Exceptions

1. The laboratory did not provide a Case Narrative associated with the radiological analyses. As this item was not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
2. The laboratory did not provide the subcontracted COC Record or the Sample Login Receipt Checklist from Pace of Peachtree Corners, Georgia to Pace Pittsburgh. As these items were not needed to complete the data validation, the laboratory had not been requested to provide this information. Qualification of data due to this issue was not warranted.
3. The laboratory did not provide the COC Record for the samples collected on 10/15/20. The missing COC pages had been requested and provided in the associated inorganic data package, SDG 92500314. Qualification due to this issue was not warranted.
4. The COC Record reported the sample collection time for MCM-14 as 9:10; the laboratory incorrectly logged in the collection time for the sample MCM-14 as 00:10 upon receipt at the laboratory. As this discrepancy did not impact the data quality, a revision was not requested. Qualification due to this issue was not warranted.
5. The data validator applied qualification to combined radium-226+228 based upon the QC samples associated with the analyses of the individual isotopes, radium-226 and radium-228. The electronic data deliverable (EDD) and the database only include the laboratory results for the combined radium-226+228; therefore, qualification of the individual isotopes is not addressed in this QA review.
6. SW-846 Method 9315 includes all alpha-emitting isotopes of radium. In order to analyze for only radium-226, a 21-day ingrowth period must be used. The radium-226 reported

by the laboratory did not undergo a 21-day ingrowth; therefore, the results reported as radium-226 potentially contain additional alpha-emitting radium isotopes and could be high biased.

7. Combined radium-226+228 was reported as the summation of the calculated activities for radium-226 and radium-228. As consistent with routine radiological reporting conventions, negative activities were reported for the radium-226 and radium-228 analyses; however, all negative activities were entered as zero in the calculation of combined radium-226+228 activity.
8. The combined radium-226+228 sample-specific minimum detectable concentration (MDC) was reported as the summation of the MDCs for radium-226 and radium-228. Consequently, there may be instances where a detection was observed in one of the individual isotopes but the combined radium-226+228 result was reported as "not-detected" due to the laboratory's reporting convention for combined radium-226+228.
9. The combined radium-226+228 result uncertainty was reported as the summation of the calculated uncertainties for radium-226 and radium-228. If routine statistical uncertainty reporting conventions were followed, the result uncertainty would have been reported as the root sum square (RSS; the square root of the sum of the squared individual uncertainties).
10. The laboratory did not flag results < the MDC as "not-detected" in the data package provided. The data validator qualified these samples as "U" on the data tables.
11. The following field duplicate pairs (see table) were submitted and analyzed for inorganic and radiological parameters with this data set. Acceptable precision and sample representativeness were demonstrated by the reported results in the field duplicate pair evaluation (replicate error ratio [RER] < 3).

<u>Laboratory SDG(s)</u>	<u>Sample</u>	<u>Field Duplicate</u>
92500310	MCM-11	DUP-1
92500310	MCM-16	DUP-2

Overall Assessment of Data

Based on a review of the data, qualification of data was warranted as noted below.

<u>Laboratory SDG(s)</u>	<u>Sample(s)</u>	<u>Analyte(s)</u>	<u>Qualifier(s)</u>	<u>Reason(s) for Qualification</u>
92500310	MCM-04, MCM-06, MCM-07, MCM-14, MCM-15, MCM-16, MCM-17, and MCM-19	combined radium-226+228	J	BE – Equipment blank contamination
92500310	MCM-11	combined radium-226+228	J	FD – Field duplicate imprecision
92500310	All samples	combined radium-226+228	J/UJ	L- – Low LCS/LCSD recoveries

- All radiological results reported below the MDC have been flagged "U."

Samples

Sample ID:	Description:
MCM-02	Metals, TDS, Inorganics, Radium

Low-Flow Test Report:

Test Date / Time: 8/26/2020 11:41:44 AM

Project: CCR AP Scan August 2020

Operator Name: Veronica Fay

Location Name: MCM- 04 Well Diameter: 2 in Casing Type: PVC Screen Length: 10 ft Top of Screen: 18.57 ft Total Depth: 28.57 ft Initial Depth to Water: 10.32 ft	Pump Type: Geotech Peristaltic Tubing Type: LDPE Pump Intake From TOC: 23.57 ft Estimated Total Volume Pumped: 2900 ml Flow Cell Volume: 90 ml Final Flow Rate: 240 ml/min Final Draw Down: 0.29 ft	Instrument Used: Aqua TROLL 400 Serial Number: 728638
--	---	--

Test Notes:

Prepurged 3L

Geotech Peristaltic Pump experiencing some erratic behavior due to weak battery. Will switch to a different peristaltic pump after completion of sample collection.

Samples

Sample ID:	Description:
MCM-05	Metals, TDS, Inorganics, Radium

Calibration Report

Instrument Aqua TROLL 400
Serial Number 728541
Created 10/12/2020

Sensor **RDO**

Serial Number 728741
Last Calibrated 10/12/2020

Calibration Details

Slope 1.195382
Offset 0.00 mg/L

Calibration point 100%

Concentration 7.13 mg/L
Temperature 23.41 °C
Barometric Pressure 1,014.4 mbar

Sensor **Conductivity**

Serial Number 728541
Last Calibrated 10/12/2020

Calibration Details

Cell Constant 0.98
Reference Temperature 25.00 °C
TDS Conversion Factor (ppm) 0.65

Sensor **Level**

Serial Number 724053
Last Calibrated Factory Defaults

Sensor	pH/ORP
Serial Number	20773
Last Calibrated	10/12/2020

Calibration Details

Total Calibration Points 3

Calibration Point 1

pH of Buffer 4.00 pH
pH mV 154.6 mV
Temperature 23.61 °C

Calibration Point 2

pH of Buffer 7.00 pH
pH mV -15.3 mV
Temperature 23.50 °C

Calibration Point 3

pH of Buffer 10.00 pH
pH mV -191.4 mV
Temperature 23.52 °C

Slope and Offset 1

Slope -56.63 mV/pH
Offset -15.3 mV

Slope and Offset 2

Slope -58.68 mV/pH
Offset -15.3 mV

ORP

ORP Solution ORP Standard

Samples

Sample ID:	Description:

Low-Flow Test Report:

Test Date / Time: 8/12/2020 12:06:19 PM

Project: CCR Well Redevelopment

Operator Name: Veronica Fay

Location Name: MCM-11 Well Diameter: 2 in Casing Type: PVC Screen Length: 10 ft Top of Screen: 14 ft Total Depth: 24 ft Initial Depth to Water: 5.35 ft	Pump Type: Proactive Cyclone Tubing Type: 3/8 LDPE Pump Intake From TOC: 19 ft Flow Cell Volume: - 0 ml Final Flow Rate: 2100 ml/min Final Draw Down: 5.3 ft Estimated Total Volume Pumped: 145.2 L	Instrument Used: Aqua TROLL 400 Serial Number: 728563
--	--	--

Test Notes:

Prepurged 139.5 L at 5L/min. Well would go dry, had to adjust pump rate several times.

Had to adjust/ decrease flow rate several times to try and get parameters to stabilize.

APPENDIX C

Surface Water Sampling Laboratory Results October – November 2020

November 17, 2020

Joju Abraham
Georgia Power-CCR
2480 Maner Road
Atlanta, GA 30339

RE: Project: MCMANUS SURFACE WATER
Pace Project No.: 92503105

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on October 30, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,

without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: MC MANUS SURFACE WATER
Pace Project No.: 92503105

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- E Analyte concentration exceeded the calibration range. The reported result is estimated.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
- R1 RPD value was outside control limits.

RE: Project: MCMANUS RESAMPLING
Pace Project No.: 92507147

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on November 19, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,

without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: MC MANUS RESAMPLING
Pace Project No.: 92507147

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
- H1 Analysis conducted outside the EPA method holding time.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
- R1 RPD value was outside control limits.

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION
PLANT McMANUS FORMER ASH POND 1

1 INTRODUCTION

Arcadis U.S., Inc. (Arcadis) has prepared this alternate source demonstration (ASD) in accordance with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule (40 Code of Federal Regulations [CFR] Part 257 Subpart D) and the Georgia Environmental Protection Division (GAEPD) Rules for Solid Waste Management 391-3-4-.10(6)(a). This report presents an ASD for the statistically significant levels (SSLs) of lithium, an Appendix IV groundwater monitoring constituent, which was detected at Georgia Power Company's Plant McManus former Ash Pond 1 (AP-1) (the site **Figure 1**). The site and CCR monitoring well network are shown on **Figure 1** and well construction details are presented in **Table 1**. The SSLs for lithium occurred at monitoring well MCM-06 in October 2019 and March 2020 with concentrations ranging from 0.064 to 0.13 milligrams per liter (mg/L) in 2019 and 2020, above the state and federal groundwater protection standards (GWPS) of 0.03 mg/L and 0.04 mg/L.

This ASD presents multiple lines of evidence that indicate that the lithium observed at former AP-1 is due to a natural source – i.e., the influx of brackish surface water during dewatering activities. Lithium is a naturally-occurring element in seawater and is present in the brackish water that is a mix of seawater and freshwater surrounding the site.

To support this ASD, the following analyses are presented in Section 3.0:

1. Evaluation of lithium concentrations in surface waters. This evaluation demonstrates that the range of lithium concentrations observed in surface water is comparable to the range of lithium concentrations observed at MCM-6.
2. Comparison of geochemistry markers in surface waters and groundwater. This comparison demonstrates that the monitoring wells where lithium is present in groundwater yield similar geochemistry to each other and the surface water, while being distinct from groundwater in monitoring wells with low estimated or non-detect lithium.
3. Variation in hydraulic conductivity across the site and variable groundwater level response to tidal fluctuations.
4. Evaluation of groundwater flow conditions and concentration trends during CCR removal. Dewatering associated with CCR removal resulted in a consistent inward lateral gradient during high and low tides. The dewatered inward flow conditions correlate with a shift in groundwater quality at several monitoring wells, including MCM-06, toward the geochemistry of the surface water.

Combined, these lines of evidence demonstrate that the former CCR unit is not the source of lithium SSLs observed in well MCM-06.

2 SITE BACKGROUND

Plant McManus is an electrical power generation plant located on Crispin Island, near Brunswick, Georgia. Crispin Island originally consisted of several smaller islands that were joined to construct Plant McManus. It was separated from the mainland to the northeast by tidal marsh and bound to the west and southwest by the Turtle River. The Turtle River is a tidally influenced brackish estuary that can vary in height by more than 8 feet during a tidal cycle (Resolute 2020a).

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION PLANT McMANUS FORMER ASH POND 1

The plant was originally constructed in 1952. Use of coal for power production ceased in 1972, and Georgia Power Company retired all coal power generating assets at Plant McManus prior to April 16, 2015. During operation of the coal-fired units from 1959 until 1972, CCR was disposed in an approximately 80-acre surface impoundment (AP-1) on the Plant McManus site northeast of the plant (**Figure 1**).

2.1 Site Geology

Plant McManus is located within the Coastal Plain Province of Georgia. The soils that make up the surficial aquifer are comprised of very fine sands with discontinuous clay layers, from land surface (or beneath a shallow fill layer) to depths ranging from 33 to 43 feet below ground surface (bgs) (Resolute 2020a). These very fine sands and discontinuous clay layers are interpreted to be the Upper Satilla Formation (ATC Associates, Inc. 1997). The Upper Satilla Formation fines downward to a silty fine sand of either the Lower Satilla Formation (ATC Associates, Inc. 1997) or the Cypresshead Formation (Huddleston 1988).

Gamma logs performed in on-site borings indicate a lower permeability layer starting between 40 and 52 feet bgs (Resolute 2020a). This is consistent with the depths of the upper confining unit of the Ebenezer Formation, described by Weems and Edwards (2001) as two pairs of alternating confining units and water-bearing zones, extending down to approximately 185 feet bgs.

The surface of the tidal marsh is covered by silt and vegetation, except where scoured by tidal creeks with fine sands in their channels. The surficial aquifer formed in a similar depositional environment, with paleo tidal channels likely present throughout, and discontinuous layers/channels of fine sand or clay. The surficial aquifer is generally unconfined, but there may be localized layers of lower permeability soils, resulting in semi-confined conditions in some locations.

2.2 Site Hydrogeology

There are two components of groundwater flow at the site. The first is along a northeast to southwest axis and originates from the mainland to the northeast and Crispin Island to the southwest. The groundwater elevations in the monitoring wells and piezometers on the mainland (MCM-01, -02, -15, and -16) and Crispin Island (MCM-08 and -11) are consistently higher than the surface water elevation in former AP-1 and the monitoring wells along both dikes, despite tidal fluctuations. This indicates that groundwater flow is consistently towards former AP-1 from the northeast and southwest. Potentiometric maps are provided in **Appendix A**.

The second component of groundwater flow is along the northwest to southeast axis between former AP-1 and the tidal marsh. Under the present ambient conditions, without the influence of dewatering, the gradient changes direction with the tides. Based on the March 2020 high and low tide potentiometric surface maps presented in Appendix A, at low tide the gradient is from former AP-1 and at high tide the gradient is inwards towards former AP-1.

2.3 Coal Ash Removal

2.3.1 Coal Ash Removal Timeline

In 2016, Georgia Power initiated CCR removal activities at former AP-1. Parts of former AP-1 were subcategorized during excavation activities to facilitate removal (Areas A, B, and C [**Figure 2**]). In general, the progression of CCR material removal was conducted in the following sequence:

- March 2016 – Began removal of bulk CCR material from Areas A, B, and C.
- February 2017 – Began saturated CCR material removal from Area C.
- March 2018 – Began saturated CCR material removal from Area B.
- April 2018 – Began saturated CCR material removal from Area A.
- October 2019 – Excavation activities were completed.

2.3.2 Dewatering

Dewatering of AP-1 was required for CCR for removal and pond closure. Dewatering wells (RW-1 through RW-10) were installed along the northern dike and dewatering activities progressed with excavation activities. After Hurricane Irma interrupted excavation activities in fall 2017, dewatering occurred in a step-wise process according to which pond was excavated. During excavation of Area C, water was pumped using a submersible pump from Area C to Areas A and B, which were within the influence of the dewatering wells. Water from Areas A and B was captured by the dewatering system, treated, and discharged. Once Area C was cleared of CCR, dewatering and CCR removal began at Area B followed by Area A. **Appendix A** provides a series of groundwater potentiometric maps during and after dewatering and excavation. An illustration of the hydrologic impacts of dewatering is provided as **Figure 3**. Dewatering activities began in February 2017 and operated nearly continuously until April 2019, a period of over 2 years. The prolonged pumping created a temporary shift in the hydrologic characteristics of the site. Further description of this hydraulic shift and its effect on lithium concentrations at monitoring well MCM-06 is discussed in Section 3.1.4.

2.4 Surface and Groundwater Chemistry

Plant McManus is situated on an island along the Turtle River, which feeds into the Saint Simons sound and the Atlantic Ocean. The Turtle River is a tidally influenced brackish estuary in the vicinity of Brunswick and Plant McManus. The water quality of brackish surface water can differ considerably compared to groundwater and reflects a mixing of saline seawaters with groundwater and freshwater inputs. Seawater has six major (above 100 parts per million [ppm]) dissolved elements: chlorine, sodium, magnesium, sulfur (as sulfate), calcium, and potassium; and six minor constituents (concentrations between 1 and 100 ppm): bromine, carbon, strontium, boron, silicon, and fluorine (Segar 1998). Trace elements, including lithium, are detected at concentrations less than 1 ppm. Lithium is the fourteenth most abundant element in seawater and are documented to range from 0.1 to 0.2 mg/L (Institute of Ocean Energy).

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION PLANT MCMANUS FORMER ASH POND 1

Typical CCR indicators (boron, sulfate, calcium, and chloride) are naturally present at elevated levels in seawater. The similarity between major, minor, and trace elements in seawater and CCR impacted water challenges the standard approaches for evaluating coal-ash sites. Therefore, in these conditions, a lines-of-evidence approach can be used to further understand the source of a constituent.

3 ALTERNATIVE SOURCE DEMONSTRATION

To evaluate alternative sources, the site conceptual model was revisited and site geochemistry, hydrogeology, historical data, and CCR removal activities were reviewed. Based on the data evaluation, the SSLs for lithium have been attributed to influxes of brackish surface water from the estuary during excavation dewatering and tidal influence in wells along the dike.

3.1.1 Lithium in Surface Water

A comparison of surface water quality to groundwater quality demonstrates that the range of lithium concentrations observed in surface water at the site is comparable to those observed in groundwater and that surface water is a viable source for lithium observed in well MCM-06. Surface water samples were collected in February 2020 and in June 2020. Memos summarizing the field activities and analytical data reports for these events are provided as **Appendix B**.

In February 2020, surface water samples were collected from 4 transects (T1 through T4) adjacent to monitoring wells MCM-04, MCM-05, MCM-07 and MCM-14, as shown on **Figures 4A and 4B**. Four sample locations were collected in each transect. In addition, samples from the surface water in the former ash pond were collected adjacent to MCM-05, MCM-06, MCM-07 and MCM-14. Samples were also collected from two background locations (**Figure 5**). One background surface water location sampled was the low tide background location, BG-1, in Cowpen Creek, north of its confluence with Burnett Creek. The other surface water sample was collected at high tide from background location 2, or BG-2, located in the Turtle River, north of its confluence with Gibson Creek.

The lithium results from surface water sampling are presented in **Table 2**. Total lithium concentrations in the surface water samples collected from the transects and background locations ranged from 0.035 (estimated) to 0.11 mg/L. This range of concentrations is comparable to the concentrations of the lithium SSLs ranging from 0.064 to 0.13 mg/L at MCM-06 in 2019 and 2020 when SSLs were identified. Total lithium concentrations in the former ash pond water were substantially lower than surface water, ranging from 0.012 (estimated) to 0.022 (estimated) mg/L.

3.1.2 Evaluation of Geochemistry Markers

Comparison of geochemistry markers in surface waters and groundwater demonstrates that the monitoring wells where lithium is present in groundwater yield similar geochemistry to each other and the surface water, while being distinct from groundwater in monitoring wells with low estimated or non-detect lithium. The June 2020 sampling event consisted of surface water samples from the two background locations within Turtle River, BG-1 and BG-2, along with groundwater samples from monitoring wells MCM-06 and MCM-07, and DPZ-02 in support of ASD development (**Figure 5**). These samples were analyzed for select cations, anions, metals, alkalinity, and total dissolved solids. Surface water data collected during this mobilization were also compared to data from the October 2019 and March 2020

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION
PLANT McMANUS FORMER ASH POND 1

Assessment Monitoring events that identified SSL lithium concentrations (Resolute 2020b). Background monitoring wells MCM-18, MCM-19, and MCM-20 were not installed at the time of the October 2019 sampling event. Nine sampling events were conducted at the background wells between November 2019 and March 2020 (Resolute 2020b). The March 2020 results were used for the comparative analysis. Notes regarding field activities completed by Resolute and data tables for the October 2019 and March 2020 sampling events are provided in **Appendices B and C**.

A direct comparison of surface water and monitoring well geochemical data supports the understanding that the source of lithium is brackish surface water. Piper plots were developed from the June data from surface water and groundwater monitoring wells MCM-06, MCM-07, and DPZ-02. Piper plots assess relative abundance of general cations and anions in groundwater and are a useful tool in differentiating water sources (Chu et al. 2017). The water quality is similar in BG-2 and the monitoring wells (**Figure 5**). Lower chloride concentrations were identified in water collected from background location BG-1; however, this is expected due to its upstream location, which is less influenced by the tidal zone.

A comparison of ratios of ions can be used to differentiate groundwater impacted by CCR from different sources. This method assumes that select ions in groundwater from a CCR source, such as boron, sulfate, calcium, chloride, and lithium, are conservative in groundwater and not retarded due to processes such as sorption or precipitation. Accordingly, the ratio of these conservative CCR ions would not change along the flowpath from a potential CCR source. At Plant McManus, many of the CCR ions (boron, sulfate, calcium, chloride and lithium) are also present in the surface water, as discussed in Section 2.4, and will be present at different characteristic ratios than a potential CCR source. Accordingly, a comparison of ion ratios is a line of evidence for evaluating a surface water versus CCR-derived source of lithium.

Figure 6 shows a correlation plot between Appendix III CCR indicator parameters chloride and lithium. The data shows several different relationships between lithium and chloride:

1. The similarity in ratios of lithium and chloride in the surface and groundwater samples shown by the orange trend line indicate that elevated lithium detections at MCM-06 are from surface water. Upgradient monitoring wells MCM-01, MCM-02, MCM-08, MCM-11, MCM-15, and MCM-16, shown with plus sign symbols, are clustered to the bottom left of the diagram demonstrating non-detect or estimated-below-reporting limit concentrations of lithium and low chloride concentrations. Downgradient monitoring well MCM-04 (grey dash symbol) and MCM-18 (grey asterisk symbol) also exhibit low estimated lithium concentrations below the reporting limit and low chloride concentrations, clustering to the lower left of the diagram. Wells located along the dikes exhibit a positive correlation between lithium and chloride along two trend lines shown in green and orange. Trendline 1, shown in orange, includes surface water samples, BG-1 and BG-2, the elevated lithium samples from MCM-06, and two samples from MCM-07 with elevated lithium. The similarity in ratios of lithium and chloride in the surface and groundwater samples along this trend line indicate the elevated lithium detections at MCM-06 are from surface water, rather than a CCR source that would be expected to have a different ratio of lithium and chloride.
2. The positive correlation of lithium and chloride along the green trend line also indicates a source of lithium from surface water. The green trend line includes samples that exhibited lower lithium concentrations from wells MCM-05, MCM-14, MCM-17, MCM-06, and MCM-07. The green trend line

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION
PLANT MCMANUS FORMER ASH POND 1

likely differs from the orange trend line because the ratio of surface water and groundwater samples differs due to variable mixing and flow conditions at those locations.

3. Finally, the samples from two background locations, MCM-19 and MCM-20 form a distinct cluster shown in blue with estimated lithium below the reporting limit consistently detected around 0.02 mg/L over a range of chloride concentrations from 5,010 mg/L to 8,130 mg/L. There is also one sample from MCM-07 that falls near this grouping shown in a blue triangle. The blue cluster of data from MCM-19 and MCM-20 is potentially a different mix of surface water and groundwater in these background locations.

To analyze several CCR indicator ions in conjunction with lithium simultaneously, concentrations for the ions are displayed on a star plot in **Figures 5 and 7**, with data in **Appendix C** for the October 2019 and March and June 2020 events. These plots visualize the relative amounts of ions present at varying orders of magnitude. A similarity in shape represents similar ratios of ions, indicating a similar source. On each plot, the surface water chemistry collected from location BG-2 in June 2020 is shown as a black dashed line while groundwater chemistry from the monitoring well is shown as a colorful solid line. Similar groundwater signatures are grouped by color. The star plots show that concentrations of boron, calcium, sulfate, lithium, and chloride in groundwater collected from several monitoring wells along the dikes (MCM-05, -06, -07, and -14) are present at ratios that are similar to surface water and to each other. In contrast, groundwater collected from the island and mainland have ion ratios dissimilar to the surface water samples. Lithium concentrations in these monitoring wells along the dikes (MCM-05, -06, -07, and -14) are similar to the range of surface water, as discussed in Section 3.1.1, and higher than wells located on the mainland and island.

3.1.3 Hydrogeologic Conditions

Variation in hydraulic conductivity across the site and variable groundwater level response to tidal fluctuations show that locations such as MCM-06 are in closer hydraulic communication with the tidal marsh than other wells. Site data collected to date, including slug tests and tidal studies, demonstrate heterogenous hydrogeologic conditions, with more groundwater flow in monitoring wells MCM-05, MCM-06, MCM-07, and MCM-14, located along the dikes (**Figure 1**).

Single well slug tests conducted in November 2019 identified a wide distribution of hydraulic conductivities across the site, from 8.67×10^{-5} centimeter per second (cm/sec) to 2.90×10^{-3} cm/sec (Resolute 2020a). The highest hydraulic conductivities were found primarily within monitoring wells along the northern and southern dikes at monitoring wells MCM-05, MCM-06, MCM-14, and MCM-17 (**Table 3**), although wells exhibiting high conductivities are also present within the mainland.

A tidal study was conducted (Resolute 2020a) to evaluate sensitivities of groundwater to changes in tides. Transducers were deployed over a period of several months. The monitoring well locations along the dikes were found to be more sensitive to tidal fluctuations during the study, especially MCM-05, MCM-06, MCM-07 and MCM-14 (**Figure 8**). The magnitude of tidal fluctuation at these monitoring wells was greater than at the other wells. Hydraulic conductivities measured at MCM-05, MCM-06 and MCM-14 are also on the high end of the range for the site. Together, the hydraulic conductivity and tidal data show these locations are in hydraulic communication with the tidal marsh. Locations MCM-05, MCM-06, MCM-07, and MCM-14 which exhibit tidal fluctuations in water levels also exhibit similar geochemistry to surface water, as discussed in Section 3.1.2.

3.1.4 Shifts in Hydraulic Conditions and Associated Water Quality Changes during Coal Ash Removal

Dewatering associated with CCR removal resulted in a consistent inward lateral gradient during high and low tides. The dewatered inward flow conditions correlate with a shift in groundwater quality at several monitoring wells, including MCM-06, toward the geochemistry of the surface water.

During the dewatering and excavation process, the water level in AP-1 was depressed below the water level in the tidal marsh (see March 2019 high and low tide potentiometric surface maps in **Appendix A**). As a result, regardless of the tidal stage, there was a consistent gradient towards AP-1 during dewatering activities, favoring lateral movement of surface water and groundwater flow towards AP-1 and the dewatering wells (**Figure 3**).

After excavation and dewatering ceased, the hydraulic gradient and direction along the dikes shifted to the present condition, where the hydraulic gradient changes with the tides, as described in Section 2. The tide cycle is approximately 6 hours between high and low tides. The amount of time for groundwater movement at each tide stage is approximately 3 hours – or less at the higher magnitude gradients that would be present at the peak tides – thus significantly limiting the opportunity for groundwater flow. These characteristics are reflected in minimal changes in concentrations of lithium and other salts after pumping ended. Over time, it is anticipated that concentrations of lithium will return to pre-excavation concentrations as steady-state hydraulic gradients are re-established.

The trend of lithium concentrations over time at monitoring wells MCM-06, MCM-07 and MCM-14 align with dewatering activities. An evaluation of lithium trends at the wells located along the dike show that lithium concentrations at well MCM-14, located along the southern dike, increased in conjunction with the progression of excavation activities and dewatering at Area C (**Figure 9**). As excavation progressed to Areas A and B (March and April 2018), water levels decreased in Areas A and B, and similar trends were then seen in monitoring wells MCM-06 and MCM-07. The increase in lithium and other water quality parameters such as total dissolved solids, sulfate, and boron in these monitoring wells likely reflects the point when the pond has been fully dewatered and the dewatering well system begins to draw in more surface water as compared to pond water. As presented in the previous section, the ion ratios of these markers are like that of surface water; therefore, Arcadis interprets the lithium to be derived from the lateral movement of brackish surface water towards the pond.

4 CONCLUSION AND RECOMMENDATION

This report serves as an ASD prepared in accordance with 40 CFR § 257.95(g)(3)(ii) and demonstrates that the SSL for lithium at Plant McManus former AP-1 monitoring well MCM-06 is attributed to naturally occurring lithium in the adjacent brackish estuary and were not due to a release from AP-1. This is demonstrated by:

- Presence of lithium in surface water, with concentrations 0.1 to 0.2 mg/L common in seawater (Institute of Ocean Energy) and concentrations up to 0.11 mg/L measured in the brackish water at surface water sampling locations in comparison to groundwater concentrations ranging from 0.064 to 0.13 mg/L at MCM-06 in 2019 and 2020;

LITHIUM ALTERNATIVE SOURCE DEMONSTRATION
PLANT McMANUS FORMER ASH POND 1

- Similarity of geochemical markers in surface water and groundwater wells with elevated concentrations of lithium;
- Variation in hydraulic conductivity across the site and variable groundwater level response to tidal fluctuations which demonstrate locations such as MCM-06 are in hydraulic communication with the tidal marsh. The locations which exhibit tidal fluctuations in water levels also exhibit similar geochemistry to surface water; and
- Shifts in groundwater chemistry and an increase in lithium concentrations at MCM-06 that coincided with the establishment of inward gradients during pond dewatering activities.

These multiple lines of evidence are exhibited at MCM-06 as well as other wells along the dike (e.g., MCM-07 and MCM-14). The evidence supports the conclusion that the lithium SSL is attributable to the influx of brackish surface water and is not attributable to CCR storage or a release from former AP-1. Therefore, no further action for lithium is warranted.

Memorandum: Surface Water Sampling Results
Georgia Power Company Plant McManus
Crispen Island Drive, Brunswick, Georgia

To: Ben Hodges, Environmental Affairs
Georgia Power Company

From: Stephen K. Wilson, P.G.
Resolute Environmental & Water Resources Consulting

1.0 PROJECT BACKGROUND

Site Location and Background

The Site is located at 1 Crispen Island Drive in Glynn County, Georgia, approximately 5 miles northwest of the city of Brunswick. The former ash pond 1 (AP-1) is located on the northeastern portion of the plant property (Figure 1). The former AP-1 was constructed in the late 1950's and encompassed approximately 80 acres. Coal ash sluicing operations at former AP-1 commenced in 1959 and ceased in 1972. Excavation and removal of ash from AP-1 commenced in 2016 and was completed in 2019. Since the completion of closure activities, the former AP-1 has filled with water, and the free water elevation within the footprint is currently approximately 2 (two) feet (NAVD88).

Preliminary statistics on the results from background groundwater monitoring, the first annual Appendix IV scan event (August 2019), and the first semiannual assessment monitoring event (November 2019) indicated one or more potentially-elevated levels of arsenic, cobalt, and lithium in groundwater detection monitoring network wells either adjacent to (MCM-05, MCM-06, MCM-07, and MCM-14) or near (MCM-04 and MCM-08) the tidal marshes located on and adjoining the site. On April 10, 2020, pursuant to the Coal Combustion Residuals (CCR) Rule, Georgia Power completed a statistical analysis of the groundwater results, which indicates that cobalt does not exceed the site-specific groundwater protection standard (GWPS) and arsenic and lithium exceed the GWPS in monitoring well MCM-06.

At the request of Georgia Power, Resolute Environmental & Water Resources Consulting, LLC (Resolute) collected surface water and groundwater samples to evaluate concentrations of arsenic, cobalt and lithium in surface water in the tidal salt marsh, free water in the footprint

of former AP-1, and in groundwater monitoring wells MCM-04, MCM-05, MCM-06, MCM-07, MMC-08, and MCM-14. Samples were collected to evaluate nature and extent at the Site. To support this evaluation, samples were collected from locations shown in Figure 1. This memorandum presents the assessment approach, sampling methodology, and results and conclusions of the sampling activities in surface water and groundwater at the Site.

2.0 ASSESSMENT APPROACH

Due to space limitations on the dikes, additional monitoring wells could not be installed between the existing detection monitoring network wells (MCM-04, MCM-05, MCM-06, MCM-07, MCM-08, and MCM-14) and the tidal marsh to evaluate the nature and extent of arsenic, cobalt, and lithium. Consistent with Georgia Power's proactive and comprehensive monitoring approach, additional sampling was completed to assess concentrations of arsenic, cobalt, and lithium in surface water in the tidal salt marsh. Resolute developed 16 sampling points divided equally among four transects (T1 through T4) adjacent to wells MCM-05, MCM-06, MCM-07, and MCM-14. Samples were also collected from groundwater monitoring wells MCM-04, MCM-05, MCM-06, MCM-07, MCM-08, and MCM-14, free water from the top of the water column in the former AP-1 adjacent to these wells, and two upstream surface water sample locations to establish background or natural conditions. To account for potential variability in water quality from tides, samples were collected at both high and low tide. Sampling locations are shown on Figure 1.

Surface water samples collected along transects T1 through T4 were collected from the top of the water column, approximately zero to six inches below the surface of the water, at both high and low tides and also from the bottom of the water column, approximately 12 inches above the marsh bottom, at high tide for the second, third, and fourth locations along each transect (e.g., T1-2, T1-3, T1-4 for transect T1).

Two background surface water sampling locations were identified and sampled to establish a dataset of naturally occurring levels of arsenic, cobalt, and lithium in surface water in the tidal marsh. The low tide background sample location (BG-1LT) was selected in Cowpen Creek, at a point which is hydraulically upgradient of both the junction with Burnett Creek and Crispen Island. At low tide, surface water flow is south from Cowpen Creek, toward the junctions with Burnett Creek and the Turtle River. The high tide background sample location (BG-2HT) was selected in the Turtle River, at a point which is upstream of Crispen Island during the incoming high tide.

Samples were initially submitted under Chain-of-Custody (COC) protocol to Pace Laboratories in Atlanta, Georgia on February 3, 2020, except for samples from transect T4, which were collected at a later date. Pace subsequently transferred the initial samples to their Asheville, North Carolina laboratory as further explained in Section 4.0 below, and the samples from transect T4, which were collected on March 18, 2020 were submitted directly to Pace's Asheville, North Carolina laboratory on March 20, 2020. Samples were analyzed for total and dissolved arsenic, cobalt, and lithium using EPA SW-846 Method 6020B.

To evaluate the data, surface water sample results for arsenic were compared to Georgia's In-Stream Water Quality Standard (ISWQS) for marine estuary environments, and groundwater samples were compared to the USEPA Maximum Contaminant Level (MCL) and the site-specific Groundwater Protection Standard (GWPS). Cobalt and lithium do not have ISWQS or recommended national ambient water quality criteria to compare surface water sample results or an MCL to compare groundwater results. Due to lack of surface water screening criteria for cobalt, surface water sample results were compared to both the observed background concentrations in surface water and the USEPA Regional Screening Level (RSL), which is a conservative approach for surface water comparison and is typically used to evaluate groundwater results.. Groundwater sample results for cobalt and lithium were compared to the RSL and site-specific GWPS since neither have an MCL.

3.0 SAMPLING METHODOLOGY

Surface water and groundwater samples were collected in accordance with the *Work Plan for Surface Water Sampling, Georgia Power Company Plant McManus, Former Ash Pond AP-1, Brunswick, Georgia*, dated January 2020, and prepared by Resolute (Work Plan) (Appendix 1). The Work Plan referenced USEPA Region 4 Science and Ecosystem Support Division (SESD), Operating Procedure, Surface Water Sampling SESDPROC-201-R3 (February 28, 2013) as a guide for surface water sampling.

The fourth surface water location in each transect (e.g., T1-4) was generally the farthest point from the ash pond dike along each transect that contained sufficient water for sampling at low tide. The first three surface water locations on each transect (e.g., T1-1 through T1-3) had insufficient water for sampling at low tide, and the samples from these locations were collected when the minimum level of surface water sufficient for sampling and access was present (approximately six inches to one foot) near low tide.

At each surface water sample location (tidal salt marsh, background, and free water in former AP-1), one bottle preserved with nitric acid was collected for total metals analysis, and a separate unpreserved bottle was collected for dissolved metals analysis. The unpreserved sample was filtered by the laboratory prior to analysis.

Groundwater sampling was conducted using the site Groundwater Monitoring Plan (GWMP) and USEPA Region 4 Field Quality and Technical Procedures as guides. Groundwater samples were collected for total metals analysis, and a sample for dissolved metals analysis was collected if sample turbidity exceeded 10 Nephelometric Turbidity Units (NTUs), in accordance with the site GWMP. Groundwater samples were collected at low and high tides in wells which were immediately adjacent to corresponding transects (MCM-05, -06, -07, and -14) and were collected at low tide in wells which were not immediately adjacent to transects (MCM-04 and -08). The latter were collected at low tide as a conservative approach based on groundwater flow toward the tidal marsh at low tide.

4.0 RESULTS

The total and dissolved metals samples were analyzed by Pace Atlanta in separate batches. Surface water samples contained high concentrations of total dissolved solids (TDS) (i.e., high concentrations of non-target ions such as sodium and chloride) because the surface water in the marsh is brackish. The laboratory reported that the high concentrations of non-target ions in the samples caused instrumentation interference problems and presented difficulty in reading the low concentrations of the arsenic, lithium, and cobalt target analytes for the instrumentation available in Pace's Atlanta laboratory.

The initial laboratory analytical results also showed the dissolved (filtered) concentrations being several times greater than the total concentrations. The elevated concentrations observed in the dissolved (filtered) results were not accurate, as the total samples collected at the same time were collected into an acidified bottle designed to preserve metals concentrations, including those potentially adsorbed to suspended solids in water. The turbidities of the samples were low, with many less than 10 NTUs; therefore, the total and dissolved concentrations should have been similar. For these reasons, the initial laboratory results were deemed to be suspect, but could not be checked by data validation procedures because the total and dissolved samples had been analyzed as separate laboratory batches. As a result, the remaining volumes of the samples were sent to Pace's laboratory in Asheville, NC for analysis using Method 6020B/3010A on a new mass spectrometer instrument which utilizes both collision cell technology and dual gas mode to make it less susceptible to interference caused by the high concentrations of non-target ions (e.g., salts) in the samples.

Samples collected along transect T4 submitted to Pace's laboratory in Asheville, NC on March 20, 2020 and did not require reanalysis.

The results of the analysis from Pace's Asheville laboratory are summarized on Tables 1 and 2, and the laboratory analytical reports are provided in Appendix 2. The total and dissolved concentrations are similar, as would be expected for samples with low turbidities such as these.

Arsenic

Arsenic was detected at low levels ranging from 0.0013 J to 0.0035 milligrams per liter (mg/L) in surface water samples, including both background samples. These results are well below the Georgia ISWQS chronic standard for dissolved arsenic (0.036 mg/L) for marine estuary environments. Arsenic in samples collected from background surface water sample locations ranged from 0.0014 J to 0.0023 mg/L. Surface water concentrations along transects T1 through T4 ranged from not detected (<0.0012 mg/L) to 0.0035 mg/L. Similar concentrations were detected in the free water samples in former AP-1 at both high and low tides ranging from 0.0013 J to 0.0025 mg/L.

Arsenic was detected in groundwater samples collected from MCM-06 (0.400 to 0.480 mg/L), above the MCL (0.010 mg/L) and site-specific GWPS (0.031 mg/L), and in MCM-07 (0.016 to

0.020 mg/L), above the MCL, but below the site-specific GWPS. Arsenic was detected at trace values between the laboratory method detection and reporting limit in MCM-04, MCM-05, and MCM-08, well below the MCL and site-specific GWPS. Arsenic was not detected in MCM-14. Concentrations in each well do not appear to be significantly affected by tidal stage.

Cobalt

Cobalt was detected at concentrations ranging from 0.0013 J to 0.0049 mg/L in surface water samples, which are slightly above background (<0.0010 mg/L), but below the RSL of 0.006 mg/L. As stated above the RSL is typically used to evaluate groundwater results and is a conservative approach for surface water comparison.

Cobalt detections in groundwater ranged from 0.0015 J to 0.0031 mg/L, which are below the RSL and site-specific GWPS of 0.031 mg/L. Concentrations in each well do not appear to be significantly affected by tidal stage. As documented in the introduction, cobalt is not an SSL in groundwater. Observed surface water data is substantially lower than cobalt in background groundwater (0.031 mg/L) and below the RSL; therefore, cobalt is no longer a constituent of interest in surface water.

Lithium

Lithium in background surface water samples ranged from 0.090 to 0.099 mg/L, which is higher than the RSL of 0.040 mg/L, which is typically used to evaluate groundwater results and is a conservative approach for surface water comparison. Lithium was detected at concentrations from 0.019 J to 0.11 mg/L in surface water samples, with the highest dissolved analysis at 0.10 mg/L in T3-4HT, which is above the RSL, but consistent with background. In comparing the 0.099 mg/L background to the 0.10 mg/L detection, the results are almost identical with a 1% difference. The laboratory reported a Relative Percent Difference (RPD) of 10% in their quality control samples for this batch of samples. Therefore, the sole detection exceeding background by 1% is well within the laboratory's repeatability range of 10%.

Lithium was detected at trace values ranging from 0.012 J to 0.022 J mg/L in free water samples in the former AP-1 and did not appear to vary at high and low tides.

In general, observed lithium concentration in background and transect surface water samples at high tide were greater than those observed at low tide. Lithium is a naturally-occurring element in seawater, and concentrations of lithium in seawater are documented to range from 0.1 to 0.2 mg/L¹. The increased concentrations observed at high tide in surface water are likely attributable to natural variability from the influx of seawater at high tide.

Lithium was detected in groundwater samples collected from MCM-06 (0.094 to 0.11 mg/L), MCM-07 (0.044 J to 0.062 mg/L), and MCM-14 (0.035 J to 0.055 mg/L), above the RSL (0.04 mg/L). Lithium was detected at trace values (between the laboratory method detection and

¹ "Lithium Occurrence", Institute of Ocean Energy, Saga University, Japan

reporting limit) in MCM-05, below the RSL. Lithium was not detected in MCM-04 or MCM-08. Concentrations in MCM-06 well appear to exhibit higher concentrations at high tide and lower concentrations at low tide. Other wells do not appear to be significantly affected by tidal stage. Lithium results in groundwater are generally consistent with previous sampling results.

5.0 CONCLUSIONS

Preliminary statistics on results from background groundwater monitoring and subsequent groundwater monitoring events (August and November 2019) indicated one or more potentially-elevated levels of arsenic, cobalt, and lithium in groundwater detection monitoring network wells adjacent to (MCM-05, MCM-06, MCM-07, and MCM-14) or near (MCM-08 and MCM-14) the tidal marshes located on and adjoining the site. Due to space limitations on the dikes, additional monitoring wells could not be installed between the existing detection monitoring network wells (MCM-04, MCM-05, MCM-06, MCM-07, MCM-08, and MCM-14) and the tidal marsh to evaluate the nature and extent of arsenic, cobalt, and lithium. Consistent with Georgia Power's proactive and comprehensive monitoring approach, surface water, groundwater, and free water sampling was completed to assess concentrations of arsenic, cobalt, and lithium in surface water in the tidal salt marsh.

Surface water sampling provided data that arsenic, cobalt, and lithium concentrations are below surface water comparison criteria or within the range of background levels observed in background surface water samples. Arsenic, cobalt, and lithium concentrations in free water samples from within the pond are below surface water comparison criteria and below levels observed in background surface water samples. On April 10, 2020, pursuant to the CCR Rule, Georgia Power completed a statistical analysis of the groundwater results, which indicates that cobalt does not exceed the site-specific GWPS and arsenic and lithium exceed the site-specific GWPS in monitoring well MCM-06. Based on the data collected, groundwater exceeding the site-specific GWPS in MCM-06 does not indicate impacts to free water quality in former AP-1 or surface water quality adjacent to Georgia Power's Plant McManus property.

Atlanta, GA 30339

RE: Project: Plant McManus
Pace Project No.: 92466089

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

QUALIFIERS

Project: Plant McManus
Pace Project No.: 92466089

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

BC The same analyte was detected in an associated blank at a concentration above 1/2 the reporting limit but below the laboratory reporting limit.
D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

RE: Project: Plant McManus SW
Pace Project No.: 92470735

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on March 24, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: Plant McManus SW

Pace Project No.: 92470735

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: Plant McManus SW
Pace Project No.: 2628570

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant McManus SW
Pace Project No.: 2628570

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

RE: Project: Plant McManus SW
Pace Project No.: 2628593

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: Plant McManus SW
Pace Project No.: 2628593

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

RE: Project: Plant McManus SW
Pace Project No.: 2628594

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant McManus SW

Pace Project No.: 2628594

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

RE: Project: Plant McManus SW
Pace Project No.: 2628595

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant McManus SW

Pace Project No.: 2628595

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: Plant McManus SW
Pace Project No.: 2628598

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant McManus SW
Pace Project No.: 2628598

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: Plant McManus SW
Pace Project No.: 2628599

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full, without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: Plant McManus SW

Pace Project No.: 2628599

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

RE: Project: Plant McManus SW
Pace Project No.: 2628600

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on February 04, 2020. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

QUALIFIERS

Project: Plant McManus SW
Pace Project No.: 2628600

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

REPORT OF LABORATORY ANALYSIS

APPENDIX IV	Lead	ND	ND	--	ND	ND	ND	--	ND
	Lithium	ND	ND	--	ND	ND	ND	--	ND
	Mercury	ND	--	--	ND	ND	--	--	ND
	Molybdenum	ND	ND	--	ND	ND	ND	--	ND
	Radium	1.20 U	1.40 U	--	1.15U	0.679 U	0.422 U	--	0.838U
	Selenium	ND	ND	--	ND	ND	ND	--	ND
	Thallium	ND	ND	--	ND	ND	ND	--	ND

Notes:

Results for substances are reported in milligrams per liter (mg/L). Radium results are reported in picocuries per liter (pCi/L)

ND (Not Detected) indicates the substance was not detected above the analytical method detection limit (MDL)

ND (value J) indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number

TDS indicates total dissolved solids

U indicates the substance was detected below the Minimum Detection Concentration (MDC) and the precision of the laboratory instruments could not produce a reliable value. Therefore, the value followed by U is qualified by the laboratory as estimated

Appendix III = indicator parameters evaluated during Detection Monitoring; Appendix IV = parameters evaluated during Assessment Monitoring

-- indicates the parameter was not analyzed

	Thallium	ND	ND	--	ND	ND	ND

Notes:

Results for substances are reported in milligrams per liter (mg/L). Radium results are reported in picocuries per liter (pCi/L)

ND (Not Detected) indicates the substance was not detected above the analytical method detection limit (MDL)

ND (value J) indicates the substance was detected at such low levels that the precision of the laboratory instruments could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated number

TDS indicates total dissolved solids

U indicates the substance was detected below the Minimum Detection Concentration (MDC) and the precision of the laboratory instruments could not produce a reliable value. Therefore, the value followed by U is qualified by the laboratory as estimated

Appendix III = indicator parameters evaluated during Detection Monitoring; Appendix IV = parameters evaluated during Assessment Monitoring

-- indicates the parameter was not analyzed

SEMIANNUAL REMEDY SELECTION AND DESIGN PROGRESS REPORT

PROFESSIONAL CERTIFICATION

This *Semiannual Remedy Selection and Design Progress Report, Georgia Power Company - Plant McManus – Former Ash Pond 1 Brunswick, Georgia*, has been prepared in accordance with the United States Environmental Protection Agency coal combustion residual rule, specifically 40 Code of Federal (CFR) 257.97(a) and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10(6)(a). This report describes the progress made during the second semiannual period of 2020 in selecting and designing a remedy previously documented in the *Assessment of Corrective Measures Report – Former Ash Pond 1 Brunswick, Georgia*, (Arcadis 2020a).

1 INTRODUCTION

1.1 Purpose

This Semiannual Remedy Selection and Design Progress Report (Semiannual Progress Report) has been prepared for the Georgia Power Company (Georgia Power) Plant McManus former Ash Pond (AP)-1 (the site; Figure 1) in accordance with the United States Environmental Protection Agency (USEPA) coal combustion residuals (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 Fed. Reg. 21302-21501, April 17, 2015), and pursuant to 40 CFR § 257.97(a) and the Georgia Environmental Protection Division Rule 391-3-4.10(6)(a). The Semiannual Progress Report was prepared to document activities conducted in support of the previously submitted Assessment of Corrective Measures (ACM) Report (Arcadis U.S., Inc. [Arcadis] 2020a). As required by the rules, this Semiannual Progress Report describes the progress made in selecting and designing a remedy for the site. This Semiannual Progress Report has been included as an appendix to the *2020 Semiannual Groundwater Monitoring and Corrective Action Report* (Resolute 2020). GPC will include future semiannual remedy selection progress reports as an appendix to the routine semiannual groundwater monitoring and corrective action reports.

Georgia Power completed the ACM Report on December 4, 2020 to address the occurrence of arsenic in groundwater at statistically significant levels (SSLs). The ACM Report was placed in the site's operating record and posted to the site's CCR Rule Compliance website. Lithium was also identified as an SSL at former AP-1, and an alternate source demonstration (ASD) was completed for lithium and submitted under a separate cover (Arcadis 2020b). The ASD is provided in the *2020 Semiannual Groundwater Monitoring and Corrective Action Report* (Semiannual Report; Resolute 2020) for reference. The ASD results indicated that concentrations of lithium in groundwater are naturally occurring.

Georgia Power conducted a human health and ecological risk evaluation to evaluate constituents that exhibit SSLs in groundwater including arsenic and lithium at former AP-1. To be conservative, lithium was carried forward into the refined risk evaluation that included multiple conservative assumptions protective of human health and the environment. The results indicated concentrations of arsenic and lithium detected in groundwater at former AP-1 do not pose a risk to human health or the environment. The *Risk Evaluation Report* (Wood Environment & Infrastructure Solutions, Inc. 2020) was provided in the ACM Report.

Pursuant to 40 CFR § 257.97, Georgia Power is evaluating the potential corrective measures presented in the ACM Report to identify an appropriate remedy or combination of remedies as soon as feasible.

The ACM Report presented the following corrective measures as potentially feasible for use at the site:

1. Geochemical Manipulation (In-Situ Injection)
2. Hydraulic Containment (Pump and Treat [P&T])
3. In Situ Stabilization/Solidification (ISS)
4. Monitored Natural Attenuation (MNA)
5. Permeable Reactive Barrier (PRB)

6. Phytoremediation
7. Subsurface Vertical Barrier Walls.

This evaluation was first completed in the ACM Report, as summarized in Table 1. Data obtained during site investigations and evaluations of corrective action alternatives in 2020 are included in this remedy selection update report.

Georgia Power will proactively initiate adaptive site management as outlined in the ACM Report (Arcadis 2020) to support the groundwater remedy selection process and address potential changes in site conditions as appropriate. The adaptive site management approach will take existing site conditions, including natural attenuation mechanisms, into account. Characterization activities to evaluate attenuation mechanisms at the site include collection of data necessary to evaluate the existing and long-term effectiveness of these processes in the aquifer and reduce uncertainty for decision making at each screening step as listed in the EPA guidelines for MNA (USEPA 2007, 2015) summarized below.

- Tier I: Constituent concentrations & plume stability
- Tier II: Constituent attenuation mechanisms
- Tier III: Aquifer capacity and stability
- Tier IV: Performance monitoring

1.2 Site Location and Description

Plant McManus is an electrical power generation plant located on Crispen Island in Glynn County, near Brunswick, Georgia (**Figure 1**). The physical address of the plant is 1 Crispen Island Drive, Brunswick, GA 31523. Crispen Island originally consisted of several smaller islands that were joined to construct Plant McManus. It was separated from the mainland to the northeast by tidal marsh and bound to the west and southwest by the Turtle River.

The plant was originally constructed in 1952 and consisted of two boilers and nine diesel-fired combustion turbines. Use of coal for production ceased in 1972, and Georgia Power retired all coal power generating assets at Plant McManus prior to April 16, 2015. During operation of the coal-fired units from 1959 until 1972, CCR was disposed in an approximately 80-acre surface impoundment (AP-1) on the Plant McManus Site northeast of the plant.

AP-1 was formed by the construction of a dike from the northeast corner of Crispen Island to the mainland. This dike formed the northwest side of AP-1, while Crispen Island, the mainland, and a southern roadway and dike (Crispen Boulevard) formed the other sides of AP-1.

1.3 Closure Activities

Source control has been implemented at the site as part of the closure process and was not specifically intended as a corrective measure. However, there is a strong potential for source control to limit future impact and improve groundwater quality.

Georgia Power completed closure of AP-1 between 2016 and October 2019 by dewatering and removing the CCR material. A notification of intent to close the former CCR Unit was placed in the operating record on December 7, 2015 and posted to the Plant McManus CCR Rule Compliance website within 30 days.

The initial Closure Plan was submitted to GAEPD on April 17, 2018 as part of the permit application package describing the closure activities and requirements in accordance with § 257.102. The Closure Plan and notification of closure completion are posted on the Plant McManus CCR Rule Compliance website, available to the public. The final CCR removal certification report was submitted in November 2019 (Arcadis 2019). The Georgia Environmental Protection Division (GAEPD) acknowledged the report and that the removal activities within the identified boundaries of AP-1 had occurred in a letter in January 2020 (GAEPD 2020).

1.4 Nature and Extent of Appendix IV Constituents

Groundwater monitoring of the surficial aquifer has been performed for former AP-1 since 2016. Groundwater results through January 2021 have shown an SSL of arsenic at MCM-06. The recent groundwater assessment data are provided in the 2020 Semiannual Groundwater Monitoring and Corrective Action Report (Resolute 2020). Investigations to characterize the nature and extent of Appendix IV constituents exceeding GWPS in 2020 included: installation of deep piezometers, collection and analysis of surface water samples, and collection and arsenic analysis of additional samples from existing wells (Arcadis 2020). Sampling locations are shown on Figure 2.

Vertical delineation at MCM-06 was evaluated with installation of deep piezometer DPZ-02 in March 2020 (Figure 3), which has since been incorporated into the monitoring well network as a delineation well. DPZ-02 was sampled in March and October 2020. October 2020 results are presented Table 7 of the Semiannual Report. Arsenic concentrations from DPZ-02 ranged from non-detect at less than the method detection limit of 0.0012 mg/L in March 2020 to 0.021 mg/L in October 2020. This indicates that arsenic concentrations above the GWPS present in groundwater at MCM-06 do not extend to the deeper portion of the aquifer, and that DPZ-02 provides vertical delineation of arsenic at MCM-06.

Due to space limitations on the dikes, additional monitoring wells could not be installed between the existing detection monitoring network wells in the vicinity of MCM-06 (MCM-04, MCM-05, MCM-07, MCM-08, and MCM-14) and the tidal marsh to evaluate the nature and extent of arsenic. Georgia Power proactively completed additional sampling to assess concentrations of arsenic in surface water in the tidal salt marsh in February, March, October, and November 2020. The October and November 2020 results are presented in Table 5 of the Semiannual Report. Arsenic concentrations in surface water samples ranged from not detected at <0.0012 mg/L to 0.0037 mg/L (estimated). These results are below the Georgia instream water quality chronic standard for dissolved arsenic (0.036 mg/L) for marine estuary environments. Arsenic concentrations in background surface water sample locations ranged from 0.0014 mg/L (estimated) to 0.0033 mg/L (estimated). Based on the data collected, no impacts to surface water have been detected and horizontal delineation is complete.

In addition to samples collected from the assessment monitoring well network, samples were collected in October 2020 from the wells used for dewatering during ash removal (RW-1 through RW-10, with RW well screen depths of 10 to 20 feet) to evaluate the extent of arsenic concentrations in groundwater along the dike between MCM-05, MCM-06, and MCM-07. The results of the sampling event are presented in Table 2, and laboratory analytical reports are included in Attachment 1. The results show that arsenic above the GWPS was limited to MCM-06 (0.45 mg/L) and RW-9 (0.038 mg/L). The updated isoconcentration contours on Figure 4 reflect these results.

2 SUMMARY OF WORK COMPLETED

2.1 Supplemental Groundwater Data Collection

Groundwater samples collected from the October 2020 semiannual assessment monitoring event were also analyzed for additional geochemical parameters to evaluate treatment technologies under consideration that are sensitive to geochemical conditions (i.e., in situ injections, P&T, ISS, MNA, PRB). Groundwater collected at former dewatering wells, MCM-05, MCM-06, MCM-07, and DPZ-02 was analyzed for major cations and anions, select total and dissolved metals, sulfide, total organic carbon, and biological oxygen demand. Field parameters (pH, dissolved oxygen, oxidation reduction potential [ORP], temperature, specific conductance, and depth to water) were also recorded. In addition, arsenic speciation analysis was conducted. Geochemical parameters, including alkalinity, biological oxygen demand, nitrate/nitrite, several forms of iron, manganese, orthophosphate, total organic carbon, and sulfide were analyzed at Pace Analytical. Samples for arsenic speciation were analyzed by Brooks Applied Laboratories. The results are presented in Table 2. Laboratory analytical reports are provided in Attachment 1.

Reducing conditions were observed in groundwater collected from wells along the northern dike (MCM-06, MCM-07, RW-7, RW-9, DPZ-02). Based on iron, manganese, sulfate and sulfide data, redox conditions varied from metal reducing to strongly sulfate reducing (Table 2). Elevated arsenic concentrations ($>0.01\text{ mg/L}$) coincided with elevated sulfide ($>20\text{ mg/L}$) and alkalinity ($>200\text{ mg/L}$) at wells located across the northern dike. Speciation analysis found that the arsenic consisted of reduced trivalent arsenic, As(III), and an unknown species, with a low concentration of oxidized pentavalent arsenic, As(V), also observed at MCM-06. These results highlight that the treatment technologies under consideration that are sensitive to geochemical conditions must be capable of treating arsenic species present in the reduced groundwater with elevated sulfide. The elevated total dissolved solids and alkalinity concentrations can also influence the effectiveness of several remedial options through altering reaction chemistry or through formation of fouling precipitates, such as carbonates.

2.2 Bench Testing for In Situ Injections

To evaluate the effectiveness of potential reagents for treatment of arsenic in groundwater by in situ injections, bench tests were conducted in 2020. The reagents tested were various formulations of the MetaFix® reagents from PeroxyChem that seek to immobilize arsenic in groundwater. Groundwater from MCM-06 and soil from DPZ-02 from 7-10 feet below ground surface were sent to the Resolution Partners LLC laboratory in Madison, Wisconsin for testing. The memorandum by PeroxyChem, provided in Attachment 2, details the bench testing experimental procedures and results. The results show several of the MetaFix® formulations were capable of substantial reductions in arsenic concentrations at the bench scale and are potential candidates for in situ injections. Additional field pilot testing would be needed to further evaluate the feasibility of injection and effectiveness of these reagents in situ. Feasibility will depend upon the ability to distribute the reagent in the subsurface. Effectiveness may differ in situ compared to the bench conditions. As discussed within Attachment 2, the removal of arsenic from solution in the bench scale was attributed to oxic conditions at the bench, which would not be present in situ.

3 PLANNED ACTIVITIES AND SCHEDULE

The former AP-1 closure was completed in late 2019 (Arcadis 2019, GAEPD 2020). The closure by removal approach provides a source control measure that reduces the potential for migration of CCR constituents to groundwater. Current conditions include management of the water levels in the former AP-1. As the aquifer adjusts to the closed conditions, concentrations of arsenic may improve. Georgia Power will implement an adaptive site management approach to support the remedial strategy and address potential changes in site conditions as appropriate. The adaptive site management approach may be adjusted over the site's life cycle as new site information and technologies become available. To this end, Georgia Power will continue its data collection efforts as necessary to support refinement of the conceptual site model and to further evaluate the feasibility of the retained list of potential corrective measures proposed in the ACM Report. At this time, all corrective measures outlined in Table 1 are being retained. Once sufficient data are available to make technically-sound decisions regarding the ability to implement one or more specific corrective measures, necessary steps will be taken to design and implement a remedy for the former AP-1 in accordance with 40 CFR § 257.98.

To achieve this goal and further the understanding of site conditions in support of remedy selection, the following activities are recommended for 2021 (summarized in Table 3):

- Continue routine groundwater sampling at Appendix III and Appendix IV constituent delineation locations to analyze and evaluate trends for effectiveness of source control and plume stability. Multiple datasets will be needed to assess temporal variations in conditions. An additional set of samples for arsenic speciation will be collected from MCM-05, MCM-06, MCM-07, and RW-9.
- Conduct a high-resolution investigation of arsenic mass flux, using a Hydraulic Profiling Tool to map aquifer permeability and Direct Push Technology to collect samples of soil and groundwater for arsenic analysis. The understanding of mass flux derived in this analysis will inform the comparative evaluation of technologies for remedy selection. Soil samples collected during the investigation will be analyzed for mineralogical analysis and physical parameters listed in Table 3.
- Conduct an evaluation of MNA as a potential remedy using the USEPA tiered analysis framework (USEPA 2007, 2015).

Georgia Power will include future semiannual remedy selection progress reports in routine groundwater monitoring reports to document groundwater conditions, results associated with additional data gathering, and the progress in selecting and designing the remedy in accordance with 40 CFR § 257.97(a). Record keeping, notifications, and publicly accessible internet site requirements for the semiannual remedy selection progress reports will be provided in accordance with 40 CFR §§ 257.105(h)(12), 257.106(h)(9), and 257.107(h)(9), respectively.

Table 1
Remedy Evaluation Summary
Semi-Annual Remedy Selection and Design Progress Report
Georgia Power Company
Plant McManus Former Ash Pond 1, Brunswick, Georgia

Technology	Description	Evaluation Criteria		
		Performance 40 CFR 257.96(c)(1)	Reliability 40 CFR 257.96(c)(1)	Ease of Implementation 40 CFR 257.96(c)(1)
<i>Geochemical Manipulation (In Situ Injection)</i>	Injection of a chemical or organic substrate to alter geochemical conditions to those more favorable for immobilization of arsenic.	<i>Moderate:</i> Effective immobilization of arsenic has been demonstrated at the bench scale; however, the effectiveness is uncertain under site-specific conditions and would require additional data and field testing. Remedial approaches to reducing constituents are typically more compatible with groundwater geochemistry and, therefore, are more viable than oxic remedial approaches.	<i>Moderate:</i> Reliability depends on: (i) the amendment distribution as a function of properties (reactivity, particle size, etc.) of the selected reagents and the permeability and heterogeneity of the subsurface; and (ii) the effectiveness of reagent chemistries for arsenic immobilization, which vary according to site-specific conditions. The approach has not been extensively used in field applications, and the most applicable methodology would require bench- and/or pilot-scale treatability testing. Stability of the precipitated phase may vary based on conditions of precipitation versus ambient conditions. Immobilization under similar conditions to ambient, reducing in this case, would promote long-term stability of the immobilized arsenic.	<i>Moderate:</i> The installation of an injection well network or placement of reagents via other injection methods would be required. Injection of reagents along the existing northern dike is likely feasible, although the workspace is narrow. The ability and scale over which reagents can be distributed depends on reagent properties, such as reactivity and, in the case of solid reagents, particle size. The feasibility of implementation will vary with scale. There is potential for clogging. An evaluation of the amendment distribution during injections (i.e., radius of influence) is needed to support full-scale design.
<i>In Situ Stabilization/Solidification (ISS)</i>	Use of amendments such as cement to reduce the bioavailability and mobility of contaminants through either physical encapsulation (solidification) or a reduction in solubility/mobility (stabilization).	<i>Moderate:</i> ISS is a proven technology for reducing the leachability and mobility of inorganic constituents above and below the water table but may be limited due to the potential size of the treatment area. Treatability depth limitations vary with application method. Within the context of former AP-1, ISS may be used either as a spot-treatment or as an impermeable barrier along the boundary of the former impoundment. Due to the size of the potential treatment area, and anticipated diffuse nature of residual arsenic, the performance of ISS is expected to be moderate. It may be used in conjunction with other treatment methods to achieve standards	<i>Moderate to High:</i> Monitoring is typically needed to confirm ISS effectiveness. Reagents such as Portland cement can cause pH changes, which may cause a release of secondary contaminants, which should also be monitored during implementation.	<i>Difficult:</i> The difficulty of ISS implementation increases with scale. If ISS is applied over a small area in the vicinity of MCM-06, the technology could be viable, whereas application over a greater scale would become difficult and impractical. ISS implementation along the narrow dike would be difficult and likely require widening.
<i>Hydraulic Containment</i>	Use of a groundwater extraction system with a surface treatment system to remove target analytes from the subsurface and/or to control/prevent constituent migration.	<i>High:</i> Pump and treat (P&T) is an effective, demonstrated technology for hydraulic control. The design of the P&T system requires groundwater modeling for the well network and, potentially, design of an above-ground treatment system. However, this remedy typically is not immediately effective for the treatment of trace level metals. There is also a possibility of rebounding when operations cease.	<i>Moderate to High:</i> Reliability may also depend on the operation and performance of an ex-situ treatment system, if needed. System downtime for maintenance may impact reliability.	<i>Difficult:</i> P&T is a longstanding, proven approach that requires installation of extraction wells/trenches. A variety of treatment technologies exist for ex-situ treatment of arsenic. The level of effort for construction and operations and maintenance (O&M) is relatively high compared to other options and requires onsite staff.
<i>Monitored Natural Attenuation (MNA)</i>	A remedial solution that takes advantage of natural attenuation processes to reduce constituents in soil and groundwater.	<i>Moderate:</i> Under the conditions of site groundwater, potential arsenic attenuation mechanisms include sorption, precipitation, oxidation-reduction reactions, dilution, and dispersion. Under the reducing conditions present at MCM-06, sorption of arsenic species, including arsenite, are likely occurring, as well as potential precipitation in reduced iron and sulfide minerals. Downgradient of MCM-06, there are likely redox gradients where aerobic conditions promote oxidation of arsenic, enhanced sorption, and potential for co-precipitation with iron oxides. The slow groundwater velocity and tidal gradient fluctuations further promote attenuation of arsenic concentrations with distance from MCM-06. Additional characterization would be needed to fully understand the attenuation processes and performance.	<i>Moderate to High:</i> The reliability of MNA is moderate to high as long as aquifer attenuation capacity is present and aquifer conditions that result in attenuation remain favorable and/or are being enhanced. Long-term monitoring well rehabilitation, replacement, or repair may be needed. Due to its location along the coast, large weather events such as hurricanes may cause fluctuations in groundwater conditions that affect attenuation processes (Northrup et al. 2017). ¹	<i>Easy:</i> A well network for MNA is already in place. Additional wells may be needed to monitor progress in select areas. Additional data would be needed to show that the existing aquifer attenuation capacity is sufficient to achieve the Groundwater Protection Standard (GWPS) within a reasonable timeframe.

Remedy Evaluation Summary
Semi-Annual Remedy Selection and Design Progress Report
Georgia Power Company
Plant McManus Former Ash Pond 1, Brunswick, Georgia

Technology	Description	Evaluation Criteria		
		Performance 40 CFR 257.96(c)(1)	Reliability 40 CFR 257.96(c)(1)	Ease of Implementation 40 CFR 257.96(c)(1)
Permeable Reactive Barrier (PRB)	Use of reactive material that extends below the water table to intercept and treat groundwater.	<i>Moderate to High:</i> PRBs have been shown to effectively address arsenic in groundwater. Performance may be affected by tidal cycles. Due to the elevated salts and alkalinity in groundwater at MCM-06, there is a risk for scaling and fouling of the reactive media, which will need to be considered during design. Delineation data will need to be collected to design an effective placement of a PRB.	<i>Moderate to High:</i> A PRB has been demonstrated effective for arsenic. Loss of reactivity over time, potentially exacerbated by brackish groundwater at the site, may require media replacement depending on the duration of the remedy. Additional data collection, including conducting a laboratory treatability test and/or field pilot study, would be needed to select the appropriate reactive media for a PRB.	<i>Moderate to difficult:</i> The practical location for the PRB is along the northern dike. Construction using trenching methods would be difficult on the narrow dike and would potentially require widening the dike. The PRB can be keyed into a relatively low permeability unit at 37 to 45 feet below ground surface (bgs) in the vicinity of MCM-06 (<i>refer to Appendix B</i>), but continuity must be confirmed. The presence of flowing sands may complicate the trenching process. Injection-style emplacements would likely be more feasible along the dike. Once installed, treatment would be passive and O&M requirements would be minimal, with the exception of media replacement.
Phytoremediation	Use of plants to remove, transfer, or stabilize constituents in soil or groundwater.	<i>Low:</i> While phytoremediation has been shown to have a degree of success treating deep contamination, site features may prove challenging for implementation of these deeper phytoremediation technologies. Brackish groundwater quality may limit the types of hyper-accumulative plants that are able to grow. A phytoremediation system may also be susceptible to damage and disruption by high winds associated with hurricanes.	<i>Low to Moderate:</i> The depth of the contamination and challenges for implementation at depth at the site make this option low to moderate in reliability. The well where Statistically Significant Levels for arsenic were identified (MCM-06) is screened at approximately 25 feet bgs, which is outside the typical rooting depth for common arsenic hyperaccumulators.	<i>Difficult:</i> The practical location for use of phytoremediation to capture arsenic and reduce concentrations at the compliance boundary is along the northern dike. Given the depths of the impacts, a TreeWell® system would be required. TreeWells® are installed in 3- to 5-foot-diameter boreholes extending to the target depth. Drilling borings within the narrow width of the dike may be challenging and require widening the dike. Depending on the number of TreeWells® and borings required, the construction could impact the stability of the dike. The presence of flowing sands and brackish water chemistry may complicate the installation process and viability of plants.
Subsurface Barrier Walls	Use of barriers to physically control the migration of impacted groundwater either directly or through manipulation of groundwater flow.	<i>Moderate:</i> Barrier walls are a proven technology for seepage control and/or groundwater cutoff at impoundments. Sheet pile walls are limited by the depth of installation, which is typically approximately 60 to 65 feet bgs with a single sheet. Within the context of former AP-1, a barrier wall as the sole remedial measure would likely be moderately effective. An alternative use of this strategy is in a “funnel and gate” system with a PRB. As such, groundwater with arsenic above the GWPS could be directed to “treatment gates” for passive treatment (in a PRB). Additional subsurface investigations and compatibility testing with groundwater from former AP-1 would be needed prior to selection and implementation. Performance may be affected by the fluctuating groundwater flow directions during tidal cycles.	<i>High – With proper installation:</i> O&M requirements can range significantly, depending on whether groundwater extraction and subsequent treatment from inside the wall is required.	<i>Moderate to difficult:</i> Limited space for construction activities along the dike makes implementation moderate to difficult. Widening the dike would likely be necessary prior to implementation. A relatively low permeability unit at 37 to 45 feet bgs in the vicinity of MCM-06 is present to key the barrier into (<i>refer to Appendix B</i>), but continuity needs to be confirmed. The presence of flowing sands may complicate the trenching process. Jet-grouting is another alternative but is typically more difficult compared to other barrier wall installation methods. Depending on design, groundwater extraction may be needed because of the inflow of water from the mainland and island.

Table 1
Remedy Evaluation Summary
Semi-Annual Remedy Selection and Design Progress Report
Georgia Power Company
Plant McManus Former Ash Pond 1, Brunswick, Georgia

Technology	Evaluation Criteria			
	Potential Impact 40 CFR 257.96(c)(1)	Estimated Time to Begin/Complete Remedy 40 CFR 257.96(c)(2)	Institutional Requirements and Other Env or Public Health Requirements 40 CFR 257.96(c)(3)	Relative Costs
<i>Geochemical Manipulation (In Situ Injection)</i>	<i>Low:</i> Low impacts are expected if the remedy works as designed, based on a thorough pre-design investigation, geochemical modeling, and bench/pilot study results. Consideration of groundwater flow to nearby sensitive environments may be needed. This remedial alternative may unintentionally alter the geochemistry within the aquifer, which may result in the mobilization of other constituents that require treatment. Short-term risks during remedial activities such as drilling and operating pressurized injection equipment can be mitigated through appropriate planning and health and safety (H&S) measures.	A thorough pre-design investigation, geochemical modeling, and/or bench scale treatability study and/or field-scale pilot testing may take up to 24 months to obtain the design parameters needed for design and construction of the corrective measure. Well construction is relatively quick (i.e., 1 to 2 months; potentially longer depending on the scale of the remedy) and time for an injection event is variable. Time to achieve the GWPS for arsenic is dependent on the attenuation process kinetics of the constituent as well as amendment longevity, injection layout, and arsenic transport properties. Additional injection events may be needed to maintain redox conditions and/or address additional flux of impacted groundwater into the treatment area.	Deed restrictions may be necessary until in situ treatment has achieved the GWPS. An Underground Injection Control Permit would be required to implement this corrective measure. No other institutional expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Potential mobilization of redox constituents may occur with in situ injections.	Medium
<i>In Situ Stabilization/Solidification (ISS)</i>	<i>Low:</i> Short-term impacts during remedy construction can be mitigated through appropriate planning and H&S measures. Changes to groundwater flow patterns due to stabilized media can occur, which can affect other aspects of the groundwater corrective action. Application of ISS mixture can also alter the geochemistry and may result in the mobilization of other constituents that require treatment. In addition, bulk mixing with reagents can occur.	Design phase and additional compatibility testing may be required, which may take up to 18 months. Completion of ISS may take an additional 12 to 18 months, depending on the final design, mixing method, and scale. Since this approach would likely not be applied to all of the impacted groundwater but rather applied to a specific source area to prevent migration, it may take an extended period of time to complete the remedy.	Deed restrictions may be necessary until groundwater concentrations are below the GWPS. No other institutional requirements expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment.	Medium to high (depending on area stabilized)
<i>Hydraulic Containment</i>	<i>Low:</i> Potential impacts are anticipated to be low. Short-term impacts during the construction of the remedy and long-term impacts during O&M can be mitigated through appropriate planning and H&S measures. Groundwater extraction may unintentionally alter the geochemistry within the hydraulic capture zone.	A thorough pre-design investigation, flow modeling, bench-scale treatability studies, and/or field-scale pilot testing may be needed. These activities may take 12 to 24 months prior to design, permitting, and construction of the corrective measure. Installation of extraction wells and/or trenches can be accomplished relatively quickly, while the time until startup is contingent on ex-situ treatment infrastructure. Hydraulic containment can be achieved relatively quickly after startup of the extraction system. However, uncertainty exists with respect to the time to achieve and maintain the GWPS and complete operations; additional data collection may be needed to better understand site mobility and attenuation mechanisms for arsenic.	A revision to the current permit may be required to withdraw water (e.g., water or consumptive use permit). Depending on the effluent management strategy, modifications to the existing National Pollutant Discharge Elimination System permit may be required for surface water discharge. In addition, deed restrictions may be necessary until groundwater concentrations are below the GWPS. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Potential mobilization of redox constituents may occur with in situ injections. Treatment system residuals require proper disposal.	Medium to high (depending on remedy duration and complexity of above-ground treatment system)
<i>Monitored Natural Attenuation (MNA)</i>	<i>Negligible:</i> Potential impacts of the remedy will be negligible because MNA relies on natural processes active in the aquifer matrix without significant disturbance to the surface or subsurface.	Implementation of the MNA remedy would require time for additional data collection and documentation, even though an existing monitoring network is already in place. Additional data collection activities may take up to 24 months to complete. The additional data would be needed for statistical analysis and to evaluate whether additional monitoring wells need to be installed to supplement the existing monitoring network. MNA timeframes range from a few years to a few decades.	Deed restrictions may be necessary until natural attenuation processes have achieved the GWPS. No other institutional requirements expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Minimally disruptive technology.	Low

Table 1
Remedy Evaluation Summary
Semi-Annual Remedy Selection and Design Progress Report
Georgia Power Company
Plant McManus Former Ash Pond 1, Brunswick, Georgia

Technology	Evaluation Criteria			
	Potential Impact 40 CFR 257.96(c)(1)	Estimated Time to Begin/Complete Remedy 40 CFR 257.96(c)(2)	Institutional Requirements and Other Env or Public Health Requirements 40 CFR 257.96(c)(3)	Relative Costs
Permeable Reactive Barrier (PRB)	Low: Impacts are expected to be low if the remedy works as designed, based on a thorough pre-design investigation, geochemical modeling, and geophysical testing. Short-term impacts during construction of the remedy can be mitigated through appropriate planning and H&S measures. Consideration of groundwater flow to nearby sensitive environments may be needed. This remedial alternative may unintentionally alter the geochemistry within the wall, which may result in the mobilization of other constituents that require treatment.	Installation of a PRB can be accomplished relatively quickly (6 to 12 months), depending on the final location and configuration. However, bench-scale treatability studies and/or compatibility testing would be required to obtain design parameters prior to design and construction of the remedy. These processes may take up to 24 months. Media may need to be replaced periodically to maintain reactive conditions and/or address additional flux of impacted groundwater into the PRB.	Deed restrictions may be necessary until groundwater concentrations are below the GWPS. No other institutional requirements expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Passive remedy with minimal disruption after installation.	Medium (for installation) with minimal O&M requirements
Phytoremediation	Low: Phytoremediation typically has low expected impacts. Depending on the phytoremediation strategy, disposal methods for vegetation with bioaccumulated arsenic may need to be considered. Short-term impacts during the construction of the remedy can be mitigated through appropriate planning and H&S measures.	Installation of a phytoremediation system can be accomplished relatively quickly (within 6 to 12 months), depending on the final location and configuration. However, treatability studies and pilot testing would be required to ensure effective treatment. These studies may take up to 24 months. Once installed, the time to achieve the GWPS downgradient of the phytoremediation system is anticipated to be long and can take multiple years before system is treating at design capacity	Deed restrictions may be necessary until groundwater concentrations are below the GWPS. No other institutional requirements expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Passive remedy with minimal disruption after installation.	Medium (for installation) with minimal O&M requirements
Subsurface Barrier Walls	Low: Impacts are expected to be low following construction of the remedy. Short-term impacts during remedy construction can be mitigated through appropriate planning and H&S measures. Changes to groundwater flow patterns due to installation of the barrier wall are expected and may require dewatering.	Design phase and additional compatibility testing may be required, which may take up to 24 months. Installation of a barrier wall can be accomplished relatively quickly (i.e., 6 to 12 months), depending on the final location and configuration. Once installed, preventing migration of constituents in groundwater is anticipated to be similar to a companion technology (e.g., PRBs or P&T). Since this approach does not treat the downgradient area of impacted groundwater but rather prevents migration from a source area, it will likely have to be maintained long-term and coupled with other approaches.	Deed restrictions may be necessary until groundwater concentrations are below the GWPS. No other institutional requirements expected. Based on the Risk Evaluation Report (Wood 2020), the arsenic SSL is not expected to pose a risk to human health or the environment. Passive remedy with minimal disruption after installation. If implemented in conjunction with P&T, treatment system residuals require proper disposal	Medium (for installation) with minimal O&M requirements

Acronyms and Abbreviations:

CFR = Code of Federal Regulations

bgs = below ground surface

GWPS = Groundwater Protection Standard

H&S = health and safety

ISS = in situ stabilization/solidification

MNA = monitored natural attenuation

O&M = operation and maintenance

P&T = pump and treat

PRB = permeable reactive barrier

SSL = statistically significant level

Notes:

Data collected as part of semi-annual monitoring (laboratory report #92500314) indicated in parentheses. All other data presented was collected as part of supplemental groundwater data collection (laboratory report #92500569)

1. Laboratory not certified for analyte.

2. Ferrous iron samples were analyzed outside of the holding time. Results are still useful for interpretation of variation in geochemical conditions, given that sum of ferric and ferrous iron is consistent with total iron.

3. Arsenic speciation samples from MCM-06, MCM-07, MCM-14, RW-01, RW-02, MW-03, RW-07, RW-08, RW-09, and RW-10 arrived at the lab at 7.1°C, above the lab recommended temperature of 6°C. The results do not appear to have been affected, i.e. oxic species were not dominant and results were comparable to DPZ-02 that was maintained below 6°C. Arsenic speciation will be resampled at MCM-05, MCM-06 and MCM-07 to verify.

J - Estimated concentration greater than the laboratory's method detection limit, but less than the laboratory's reporting limit.

< not detect above method detection limited listed

Acronyms and Abbreviations:

°C - degrees Centigrade	mg/L - milligram per liter
µg/L - micrograms per liter	mV - millivolts
µS/cm - microsiemens per centimeter	NT

RE: Project: MCMANUS APP III
Pace Project No.: 92500569

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between October 15, 2020 and October 16, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: MC MANUS APP III
Pace Project No.: 92500569

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.
ND - Not Detected at or above adjusted reporting limit.
TNTC - Too Numerous To Count
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.
MDL - Adjusted Method Detection Limit.
PQL - Practical Quantitation Limit.
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.
S - Surrogate
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.
LCS(D) - Laboratory Control Sample (Duplicate)
MS(D) - Matrix Spike (Duplicate)
DUP - Sample Duplicate
RPD - Relative Percent Difference
NC - Not Calculable.
SG - Silica Gel - Clean-Up
U - Indicates the compound was analyzed for, but not detected.
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.
TNI - The NELAC Institute.

ANALYTE QUALIFIERS

- B2 Oxygen usage is less than 2.0 for all dilutions set. The reported value is an estimated less than value and is calculated for the dilution using the most amount of sample.
- D6 The precision between the sample and sample duplicate exceeded laboratory control limits.
- E Analyte concentration exceeded the calibration range. The reported result is estimated.
- H1 Analysis conducted outside the EPA method holding time.
- H2 Extraction or preparation conducted outside EPA method holding time.
- H3 Sample was received or analysis requested beyond the recognized method holding time.
- M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
- M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.
- N2 The lab does not hold NELAC/TNI accreditation for this parameter but other accreditations/certifications may apply. A complete list of accreditations/certifications is available upon request.
- R1 RPD value was outside control limits.

RE: Project: MCMANUS AS SPECIATION
Pace Project No.: 92500800

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on October 15, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

Some analyses were subcontracted outside of the Pace Network. The test report from the external subcontractor is attached to this report in its entirety.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

 Kevin.Herring@pacelabs.com

RE: Project PAC-HN2007

Client Project: 92500800

Dear Kevin Herring,

On October 15, 2020, Brooks Applied Labs (BAL) received eleven (11) water samples at a temperature of 7.1°C. The samples were logged-in for the analysis of arsenic (As) speciation per the chain-of-custody (COC). The client directly filtered (0.45µm) each sample into an evacuated container prior to receipt at BAL. All samples were stored according to BAL SOPs and EPA methodology.

BAL strongly recommends that all samples submitted for arsenic speciation remain at a temperature of less than or equal to 6° Celsius to maintain sample integrity prior to analysis. Consequently, the As speciation results were qualified (**Z**), indicating that the samples were received above the recommended temperature.

Arsenic Speciation by IC-ICP-CRC-MS

All aqueous samples for As speciation were analyzed using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). In accordance with the project agreement, As speciation was defined as dissolved arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs]; the total estimated concentration of any unidentified arsenic-containing species detected in each sample has also been reported as Unk As Sp. Arsenic species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the Interference Reduction Technology section on our website, brooksapplied.com.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

The results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

It should be noted that all Brooks Applied Labs, LLC methods, standard operating procedures, inventions, ideas, processes, improvements, designs and techniques included or referred to therein, must be considered and treated as Proprietary Information, protected by the Washington State Trade Secret Act, RCW 19.108 et seq., and other laws. All Proprietary Information, written or implied, will not be distributed,

copied, or altered in any fashion without prior written consent from Brooks Applied Labs, LLC. All Proprietary Information (including originals, copies, summaries or other reproductions thereof) shall remain the property of Brooks Applied Labs, LLC at all times and must be returned upon demand. Furthermore, products presented in this document may be protected by Federal Patent laws and infringement will be subject to prosecution in accordance with Title 35 US Code 271.

All data was reported without further qualification and all other associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report. Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Amy Goodall
Project Manager
Brooks Applied Labs

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <<http://www.brooksapplied.com/resources/certificates-permits/>> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

- E** An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
- H** Holding time and/or preservation requirements not met. Please see narrative for explanation.
- J** Detected by the instrument, the result is $>$ the MDL but \leq the MRL. Result is reported and considered an estimate.
- J-1** Estimated value. A full explanation is presented in the narrative.
- M** Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
- N** Spike recovery was not within acceptance criteria. Please see narrative for explanation.
- R** Rejected, unusable value. A full explanation is presented in the narrative.
- U** Result is \leq the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
- X** Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch.
Result is estimated.
- Z** Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Accreditation Information

RE: Project: MCMANUS AS SPECIATION
Pace Project No.: 92501055

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on October 16, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

Some analyses were subcontracted outside of the Pace Network. The test report from the external subcontractor is attached to this report in its entirety.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

RE: Project PAC-HN2007

Client Project: 92501055

Dear Kevin Herring,

On October 16, 2020, Brooks Applied Labs (BAL) received seven (7) water samples at a temperature of 1.6°C. The samples were logged-in for the analysis of arsenic (As) speciation per the chain-of-custody (COC). The client directly filtered (0.45µm) each sample into an evacuated container prior to receipt at BAL. All samples were stored according to BAL SOPs and EPA methodology.

Arsenic Speciation by IC-ICP-CRC-MS

All aqueous samples for As speciation were analyzed using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). In accordance with the project agreement, As speciation was defined as dissolved arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid [MMAs], and dimethylarsinic acid [DMAs]; the total estimated concentration of any unidentified arsenic-containing species detected in each sample has also been reported as Unk As Sp. Arsenic species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the Interference Reduction Technology section on our website, brooksapplied.com.

In instances where the native sample result and/or the associated duplicate (DUP) result were below the MDL the RPD was not calculated (**N/C**).

The results were not method blank corrected as described in the calculations section of the relevant BAL SOP(s) and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

It should be noted that all Brooks Applied Labs, LLC methods, standard operating procedures, inventions, ideas, processes, improvements, designs and techniques included or referred to therein, must be considered and treated as Proprietary Information, protected by the Washington State Trade Secret Act, RCW 19.108 et seq., and other laws. All Proprietary Information, written or implied, will not be distributed, copied, or altered in any fashion without prior written consent from Brooks Applied Labs, LLC. All Proprietary Information (including originals, copies, summaries or other reproductions thereof) shall remain the property of Brooks Applied Labs, LLC at all times and must be returned upon demand. Furthermore, products presented in this document may be protected by Federal Patent laws and infringement will be subject to prosecution in accordance with Title 35 US Code 271.

All data was reported without further qualification and all other associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information please see the *Report Information* page in your report. Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <<http://www.brooksapplied.com/resources/certificates-permits/>> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

- E** An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
- H** Holding time and/or preservation requirements not met. Please see narrative for explanation.
- J** Detected by the instrument, the result is $>$ the MDL but \leq the MRL. Result is reported and considered an estimate.
- J-1** Estimated value. A full explanation is presented in the narrative.
- M** Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
- N** Spike recovery was not within acceptance criteria. Please see narrative for explanation.
- R** Rejected, unusable value. A full explanation is presented in the narrative.
- U** Result is \leq the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
- X** Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch.
Result is estimated.
- Z** Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Accreditation Information

Table 1. Accredited method/matrix/analytes for TNI
Issued by: State of Florida Dept. of Health (The NELAC Institute 2016 Standard)
Issued on: July 27, 2020; Valid to: June 30, 2021
Certificate Number: E87982-35

Method	Matrix	TNI Accredited Analyte(s)
EPA 1638	Non-Potable Waters	Ag, Cd, Cu, Ni, Pb, Sb, Se, Ti, Zn
EPA 200.8	Non-Potable Waters	Ag, Al, As, Ba, Be, Cd, Co, Cr, Cu, Mn, Mo, Ni, Pb, Sb, Se, Ti, U, V, Zn

Bench-scale Treatability Testing for Soluble Arsenic and Lithium
in Groundwater (Phase I and Phase II Summary Report)
(PeroxyChem 2020)

9 September 2020

Stephen K. Wilson, P.G.
Principal
Resolute Consulting
1003 Weatherstone Parkway, Suite 320
Woodstock, Georgia 30188

**Subject: Bench-scale Treatability Testing for Soluble Arsenic and Lithium in Groundwater
(Phase I and Phase II Summary Report)**

Dear Mr. Wilson:

Bench-scale treatability testing was conducted using PeroxyChem's MetaFix® reagents and soil and groundwater samples collected from the Dike area of an industrial site in Georgia (the Site). The objective of the work was to evaluate the efficacy of MetaFix® reagents for removal of soluble arsenic and lithium in groundwater at the Site. The treatability testing was conducted by Resolution Partners LLC at their laboratory in Madison Wisconsin, under the direction of PeroxyChem.

Baseline Groundwater Characterization

A plastic cooler containing groundwater (2.0 gallons) and soil (1 gallon) samples packed in ice was received by Resolution Partners LLC at their laboratory in Madison WI on 24 March 2020. The groundwater was labeled as MCM-06 and the soil was labeled as DPZ-2 (7-10). The soil sample was homogenized, and subsamples of the soil and groundwater were subjected to baseline characterization including pH, arsenic, and lithium.

Subsamples of the homogenized groundwater and soil samples were submitted to URSUS Laboratories (Mt. Horeb WI) for determination of the as-received arsenic and lithium concentrations by US EPA Method 6010 (inductively coupled plasma-optical emission spectrometry). The pH of both soil and groundwater were determined in-house by Resolution Partners. The results are presented in Table 1.

Arsenic and lithium concentrations in the MCM-06 groundwater were 220 µg/L and 120 µg/L, respectively. The DPZ-2 (7-10) soil analysis indicated arsenic and lithium concentrations of 4,100 µg/kg and 12,000 µg/kg, respectively. The pH of the MCM-06 groundwater was near neutral at 6.95 while the DPZ-2 (7-10) soil was somewhat more alkaline (7.58).

Following consultation with Resolute, it was agreed to proceed with the bench-scale treatability testing using the as-received groundwater and soil samples (i.e., no spiking of arsenic or lithium was required).

Table 1: Baseline characterization of soil and groundwater samples from the Dike site.

Groundwater & Soil Samples	Description	pH	Analyte (µg/L groundwater, µg/kg soil)	
			Arsenic	Lithium
MCM-06 (Dike site groundwater)	Clear, no odor.	6.95	220	120
DPZ-2 (7-10) (Dike site soil)	Poorly graded sand (SP), fine sand, non-plastic, light brownish grey 10YR6/2, no odor, moist.	7.58	4,100	12,000

Treatability Test Set-up

To determine the influence of the reagents and their dosages on soluble arsenic and lithium concentrations, amber glass microcosms were loaded with 200 mL of MCM-06 groundwater and 20.0 g of DPZ-2 (7-10) soil and then amended with the prescribed mass of each reagent. The microcosms were sealed with Teflon®-lined lids and then incubated for 14 days with daily tumbling. The control contained only groundwater and soil (i.e., no reagent was added). Upon completion of the incubation, samples were filtered through a 0.45 µm glass fiber filter and the filtered groundwater was analyzed for total arsenic.

Treatability Test Results: Phase I

The influence of these treatments on total soluble arsenic and lithium in the filtered groundwater is presented in Table 2.

Table 2. Influence of Phase I treatments on soluble As and Li in the MCM-06 groundwater/DPZ-2 (7-10) soil blend.

Each microcosm contained DPZ-2 (7-10) soil (20.0 g) + MCM-06 groundwater (200 mL)				
Identifier	Dosage (% w/w)	pH (s.u.)	Total Arsenic	Total Lithium
			(µg/L groundwater; µg/kg soil)	
As-received Groundwater	-	6.95	220	120
As-received Soil	-	7.58	4,100	12,000
Untreated Control	-	6.45	6.0	100
MetaFix® 1	1.25	6.14	<3.0	130
MetaFix® 2	1.25	6.20	<3.0	120
MetaFix® 3	1.0	8.56	16	49
MetaFix® 4	1.0	7.88	23	74
MetaFix® 5	0.75	5.25	170	140
MetaFix® 6	1.0	6.27	<3.0	130

Arsenic

Substantial reductions in soluble arsenic concentration, as compared to the as received groundwater, and the untreated control, were observed in response to three of the treatments (MetaFix 1, MetaFix 2, and MetaFix 6). In response to these treatments, soluble arsenic was reduced to less than the method detection limit of 3.0 µg/L. Other treatments reduced arsenic as compared to the as-received groundwater but not as compared with the untreated control.

The observed reduction in soluble arsenic in the untreated control was most probably caused by coprecipitation of arsenic with iron as ferric arsenate (Equation 1).

Such coprecipitation may have been promoted by oxic, near neutral pH conditions in the untreated control as (a) native ferrous iron (Fe^{+2}) was oxidized to ferric form (Fe^{+3}) and the uncharged form of arsenic (i.e., As(III), arsenite) was oxidized to the anionic form (As(V), arsenate). If trace amounts of barium were present in the groundwater it is also possible that soluble arsenic in the untreated control may have precipitated as barium arsenate ($\text{Ba}_3\text{As}_2\text{O}_8$). Both ferric arsenate and barium arsenate have aqueous solubilities below 0.3 µg/L.

Lithium

Lithium in the untreated control was 100 µg/L, comparable to that determined for the as-received groundwater (120 µg/L). Only one treatment (MetaFix 3) supported appreciable removal of soluble lithium. In response to this treatment soluble lithium was reduced about 60% as compared to the as-received groundwater (i.e., from 120 µg/L to 49 µg/L). The MetaFix 3 treatment was designed to promote precipitation and coprecipitation of lithium (Li^+) in the form of low solubility minerals with broad pH stability. The observed degree of lithium removal is high enough to serve as proof of concept. We are confident that greater lithium removal efficiency could be achieved with optimization of the treatment conditions including pH, reagent dosage, and a longer reaction period.

None of the treatments was found to be effective for removal of both soluble arsenic and soluble lithium. As a result, a second treatability investigation designed to focus on increasing lithium removal and combining the more effective treatments for arsenic with the most effective treatment for lithium. The set-up used in the second treatability test (Phase II) was the same as that used in the first treatability test (Phase I); however, the incubation period was increased from 14 days to 28 days.

Treatability Test Results: Phase II

The influence of the Phase II treatments on pH, soluble arsenic and soluble lithium in the groundwater/soil blend is presented in Table 3.

Arsenic

Several of the MetaFix treatments produced substantial reductions in soluble arsenic concentration as compared to the as received groundwater. The most effective treatment for arsenic was MetaFix 7 which

reduced soluble As to below the method detection limit of 5.0 µg/L. It should also be noted that arsenic in the untreated control was below the method detection limit of 5.0 µg/L. A discussion of the chemistry most probably involved in removal of soluble arsenic in the control is provided in the section on Phase I test results (above).

Table 3: Influence of Phase II treatments on soluble As and Li in the MCM-06 groundwater/DPZ-2 soil blend.

Each microcosm contained DPZ-2 (7-10) soil (20.0 g) + MCM-06 groundwater (200 mL)				
Identifier	Dosage (% w/w)	Final pH (s.u.)	Total Arsenic	Total Lithium
			(µg/L groundwater; µg/kg soil)	
As-received Groundwater	-	6.95	220	120
As-received Soil	-	7.58	4,100	12,000
Untreated Control	-	5.31	<5.0	48
MetaFix® 1	1.0	8.02	7.0	26
MetaFix® 2	1.5	8.51	7.0	23
MetaFix® 3	2.25	8.86	16	15
MetaFix® 4	1.75	8.03	10	33
MetaFix® 5	1.5	8.05	8.0	30
MetaFix® 6	1.5	7.87	9.0	32
MetaFix® 7	1.25	7.77	<6.0	31
MetaFix® 8	1.75	8.26	9.0	34
MetaFix® 9	1.5	8.11	11	33

Lithium

Lithium in the untreated control was found to be 48 µg/L as compared to 120 µg/L in the as-received groundwater. A relatively stable concentration of lithium in the untreated control is expected, because lithium in its most common and soluble form (Li^+) is the least reactive of the alkali metals. Relative to the untreated control, all the MetaFix treatments reduced soluble lithium. The most effective treatment for lithium was MetaFix 3 which reduced by almost 70% to 15 µg/L. It should be noted that the MetaFix 7 treatment reduced soluble lithium from 48 µg/L to 31 µg/L and also achieved complete removal of soluble arsenic.

Other Metals

Samples from MetaFix 7 treatment and the untreated control were submitted for determination of a range of other metals and the results are presented in Table 4.

Table 4: Influence of MetaFix® 7 treatment on concentrations of selected metals.

Control or Treatment	Analyte ($\mu\text{g/L}$)												
	As	Li	Ba	Be	Cd	Co	Cr	Hg	Mo	Pb	Sb	Se	Tl
Control	<5.0	48	250	1.0	3.0	49	<5.0	<50	<10	<30	<50	<30	<10
MetaFix 7	<6.0	31	140	<1.0	<3.0	<10	<5.0	<50	91	<30	<50	<30	<10

Summary and Recommendations

Given the relatively short reaction period (14 days in Phase I and 28 days in Phase II) we believe that the treatability test results should be viewed as conservative and that continued removal of both arsenic and lithium may be expected over time at the Site. Since MetaFix 7 achieved complete removal of soluble arsenic as well as substantial removal of soluble lithium we recommend this treatment for application to groundwater at the Site.

I would be pleased to answer any questions you may have about the treatability testing and this report.

Sincerely,

Alan Seech, Ph.D.

Woodstock, GA 30188

Re: Plant McManus Ash Pond (AP)
1st Semi-Annual Statistical Analysis – October 2020 Sampling Event

Dear Mr. Wilson,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater data for the Groundwater Monitoring and Corrective Action 1st Semi-Annual October 2020 sample event for Georgia Power Company's Plant McManus Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

The groundwater monitoring well network consists of the following:

- **Upgradient Wells:** MCM-01, MCM-02, MCM-11, MCM-15, MCM-16, MCM-18, MCM-19, and MCM-20
- **Downgradient Wells:** MCM-04, MCM-05, MCM-06, MCM-07, MCM-12, MCM-14, and MCM-17

Note that upgradient wells MCM-18, MCM-19, and MCM-20 were installed late in 2019. A minimum of 8 samples have been collected at each well and data from these wells are included in this analysis. For some constituents in these upgradient wells such as arsenic, calcium, lead, and lithium, the concentrations are higher in comparison to other upgradient wells.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed Kristina Rayner, Groundwater Statistician and Founder of Groundwater Stats Consulting.

The statistical analysis provided in this report was performed according to the background screening conducted by MacStat Consulting in April 2019. Interwell prediction limits, combined with a 1-of-2 resample plan, for Appendix III parameters were recommended as the primary statistical method.

The CCR program monitors the constituents listed below. The terms "parameters" and "constituents" are used interchangeably.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. Summaries of well/constituent pairs with 100% nondetects follow this letter. Additionally, when Appendix IV constituents are not detected during a scheduled Scan event, statistical analyses may not be required during the following semi-annual sample event. During the annual Scan event for 2020, antimony, cadmium, chromium, mercury, molybdenum, and thallium were not detected, and therefore, were not required to be sampled during the October 2020 event. These constituents were included on time series and box plots, but were not included in statistical analyses.

For all constituents, a substitution of the most recent reporting limit is used for nondetect data. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group. For calculating prediction limits, the substitution is performed for individual wells and may differ across wells. This generally gives the most conservative limit in each case. However, in some cases the most recent reporting limit increased compared to historical data and, therefore, the lower historical reporting limit was substituted for nondetects to maintain more conservative limits. Due to varying detection limits, the following reporting limits were used for these constituents across all wells:

- Antimony: 0.003 mg/L
- Lithium: 0.03 mg/L
- Molybdenum: 0.01 mg/L
- Thallium: 0.001 mg/L

When concentrations exist higher in downgradient wells relative to observations reported upgradient of the facility, as seen in the majority of the Appendix III parameters, this may be reflective of natural variation or a result of practices at the facility. A separate study and hydrogeological investigation would be required to fully understand the geochemical conditions and expected groundwater quality for the region. That study and assessment is beyond the scope of services provided by Groundwater Stats Consulting.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

No values were previously flagged as outliers during the April 2019 screening; however, the following non-detect values were flagged due to elevated reporting limits: <0.025 mg/L for lead in upgradient well MCM-19; and <0.1 mg/L, <0.15 mg/L and <0.3 mg/L for lithium in upgradient well MCM-18. Additionally, a high value for combined radium 226 + 228 in upgradient well MCM-20 was flagged as an outlier. These steps result in construction of background limits that are conservative from a regulatory perspective.

Based on the 2019 screening, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when introwell statistical methods are recommended. Power curves were provided with the 2019 screening to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

Summary of Statistical Methods:

Based on the evaluation for state and federal regulatory requirements, the following methods were selected for Appendix III and IV constituents:

- Appendix III: Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- Appendix IV: Confidence intervals on downgradient well data compared against Ground Water Protection Standards (GWPS) for each Appendix IV constituent

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. Parametric prediction limits (or tolerance limits or confidence intervals as applicable) are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The following approaches are used for handling nondetects (USEPA, 2009):

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. While this was not required for this report, in some cases, deselecting the earlier portion

of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Statistical Analysis of Appendix III Parameters – October 2020

All Appendix III parameters were analyzed using interwell prediction limits. Background (upgradient) well data were re-assessed for potential outliers during this analysis. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. No new values were flagged for Appendix III parameters in upgradient wells and a summary of flagged outliers follows this report (Figure C).

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through October 2020 (Figure D). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether there are statistically significant increases (SSIs).

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result and, therefore, no exceedance is noted and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. A summary table of the interwell prediction limits follows this letter and includes a list of exceedances. Exceedances were identified for the following well/constituent pairs:

- Boron: MCM-06, MCM-07, and MCM-17
- Calcium: MCM-06 and MCM-07
- pH: MCM-05, MCM-06, MCM-07, MCM-12, MCM-14, and MCM-17
- TDS: MCM-06, MCM-07, and MCM-14

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure E). Upgradient well data are included in the trend analyses for all parameters found to exceed their prediction

limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of trend test results follows this letter including a list of statistically significant trends. Statistically significant trends were identified for the following well/constituent pairs:

Increasing:

- Boron: MCM-06
- Calcium: MCM-07
- TDS: MCM-06, MCM-07, and MCM-14

Decreasing:

- Calcium: MCM-18 (upgradient)
- pH: MCM-11 (upgradient), MCM-05, MCM-06, MCM-12, and MCM-14
- TDS: MCM-18 (upgradient)

Statistical Analysis of Appendix IV Parameters – October 2020

For Appendix IV parameters, confidence intervals for each downgradient well/constituent pair were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. Well/constituent pairs that have 100% nondetects do not require analysis. Data from all wells for Appendix IV parameters are reassessed for outliers during each analysis. A high value for fluoride in downgradient well MCM-06 was flagged and a summary of flagged outliers follows this report (Figure C).

First, interwell tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through October 2020 for Appendix IV constituents (Figure F). Parametric tolerance limits are used when data follow a normal or transformed-normal distribution. When data contained greater than 50% nondetects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used. The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a).

As described in 40 CFR §257.95(h) (1-3), the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title

- Where an MCL has not been established for a constituent, CCR-rule specified level have been specified for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

On July 30, 2018, USEPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Georgia EPD has not incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a); therefore, for sites regulated under Georgia EPD Rules, the GWPS is:

- The MCL or
- The background concentration when an MCL is not established or when the background concentration is higher than the MCL.

Following Georgia EPD Rule requirements and the Federal CCR requirements, Federal and State GWPS were established for statistical comparison of Appendix IV constituents for the October 2020 sample event (Figure G).

To complete the statistical comparison of downgradient well data to GWPS, confidence intervals were constructed for the Appendix IV constituents in each downgradient well. The Sanitas software was used to calculate both the tolerance limits and the confidence intervals. For Federal requirements, confidence intervals were compared to the GWPS prepared according to the CCR Rule (Figure H). For the State requirements, confidence intervals were compared to the GWPS established using the Georgia EPD Rules 391-3-4-.10(6)(a) (Figure I). The background limit for combined radium 226 + 228 is considerably higher than the MCL due to high concentrations in upgradient wells, such as those in upgradient well MCM-20. Additionally, TDS appears to be highly variable across the site, particularly upgradient of the site. These concentrations are assumed to represent natural groundwater quality since the reported measurements are in upgradient wells; however, this determination is beyond the scope of this analysis.

Only when the entire confidence interval is above a GWPS is the downgradient well/constituent pair considered to exceed its respective standard. If there is an exceedance of the GWPS, a statistically significant level (SSL) exceedance is identified. Summaries of both the Federal and State confidence intervals follow this letter and exceedances were identified for the following well/constituent pairs:

Federal and State:

- Arsenic: MCM-06
- Lithium: MCM-06

Addendum Report – January 2021

Additional data were collected in January 2021 for the following constituents at well MCM-05: arsenic, barium, beryllium, boron, calcium, chloride, cobalt, combined radium 226 + 228, fluoride, lead, lithium, pH, selenium, sulfate, and TDS. Time series and box plots were generated for all sampled constituents (Figures J and K, respectively). Interwell prediction limits were constructed for Appendix III parameters, using pooled upgradient well data through October 2020, to compare the January 2021 sample at well MCM-05 (Figure L). An exceedance was identified for pH in this well and complete graphical results of the interwell prediction limits follow this report. A Sen's Slope/Mann-Kendall trend test was used to evaluate the pH exceedance (Figure M). A statistically significant decreasing trend was identified for pH at well MCM-05 and complete graphical results of the trend tests follow this letter.

For arsenic, barium, beryllium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, and selenium, confidence intervals were constructed for well MW-05 to compare all data at this well through January 2021 to the established Federal and State GWPS (Figure G). No exceedances were identified for either federal or state confidence intervals (Figures N and O, respectively).

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for the Plant McManus Ash Pond. If you have any questions or comments, please feel free to contact us.

Exceeds Limit: MCM-06, MCM-07, MCM-17

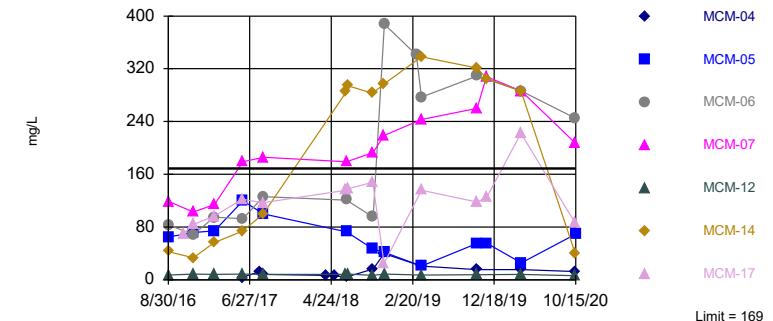

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 90 background values. 5.556% NDs. Annual per-constituent alpha = 0.003314. Individual comparison alpha = 0.0002371 (1 of 2). Comparing 7 points to limit.

Exceeds Limit: MCM-06, MCM-07

Prediction Limit
Interwell Non-parametric

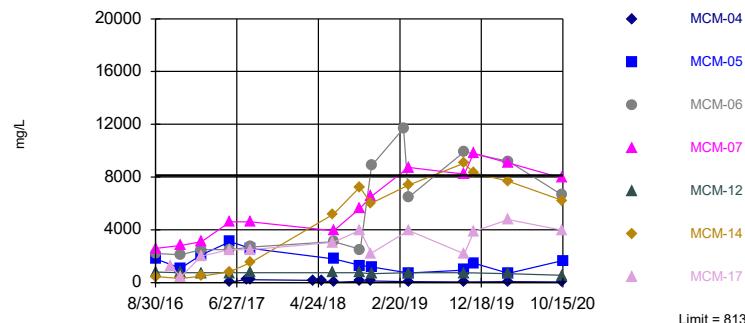

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 91 background values. 1.099% NDs. Annual per-constituent alpha = 0.003253. Individual comparison alpha = 0.0002327 (1 of 2). Comparing 7 points to limit.

Within Limit

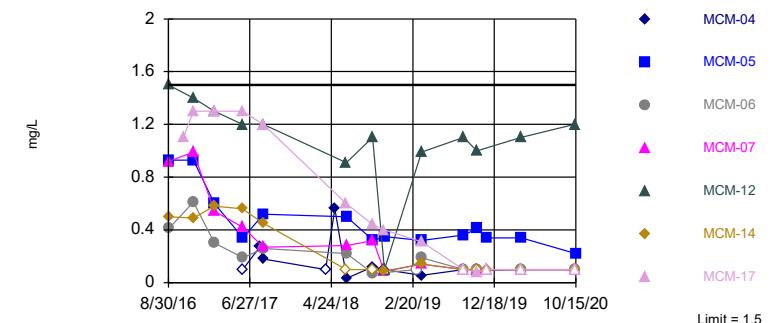

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 90 background values. 5.556% NDs. Annual per-constituent alpha = 0.003314. Individual comparison alpha = 0.0002371 (1 of 2). Assumes 6 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

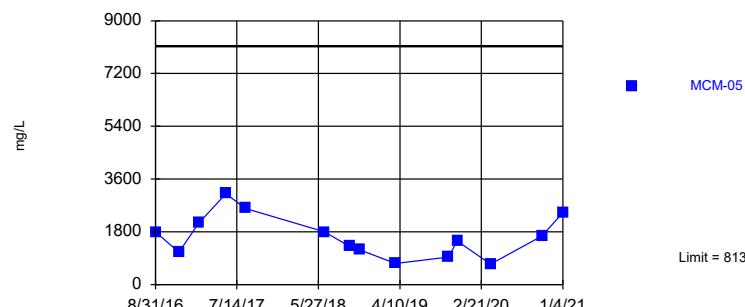

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 91 background values. 1.099% NDs. Annual per-constituent alpha = 0.003253. Individual comparison alpha = 0.0002327 (1 of 2). Assumes 6 future values.

Constituent: Boron Analysis Run 2/16/2021 3:40 PM View: Addendum

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 90 background values. Annual per-constituent alpha = 0.003314. Individual comparison alpha = 0.0002371 (1 of 2). Assumes 6 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

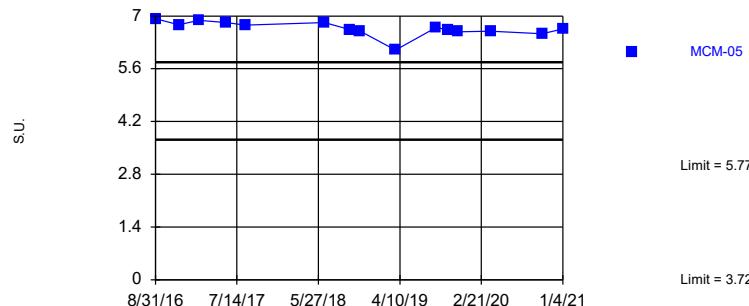

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 95 background values. 40% NDs. Annual per-constituent alpha = 0.003006. Individual comparison alpha = 0.000215 (1 of 2). Assumes 6 future values.

Exceeds Limits: MCM-05

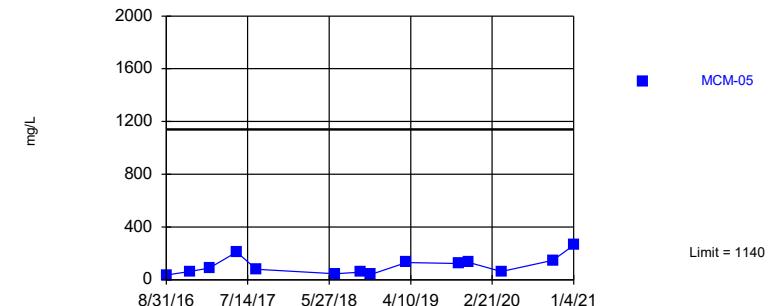

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 94 background values. Annual per-constituent alpha = 0.006135. Individual comparison alpha = 0.0004389 (1 of 2). Assumes 6 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

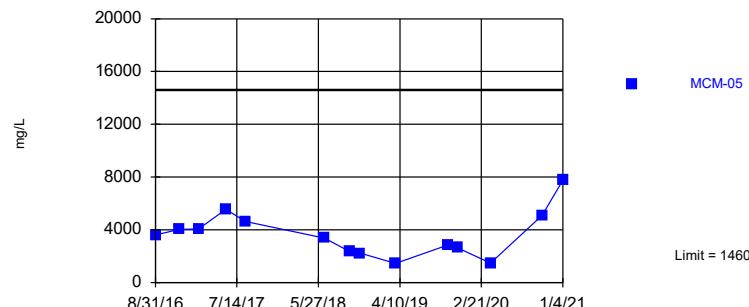

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 89 background values. Annual per-constituent alpha = 0.0034. Individual comparison alpha = 0.0002432 (1 of 2). Assumes 6 future values.
