CERTIFICATION STATEMENT

This 2020 Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company - Plant Bowen – Ash Pond 1 (AP-1) has been prepared in compliance with the United States Environmental Protection Agency coal combustion residual rule [40 Code of Federal Regulations (CFR) 257 Subpart D], specifically § 257.90(e), and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with Geosyntec Consultants.

EXECUTIVE SUMMARY

This summary of the 2020 Annual Groundwater Monitoring and Corrective Action Report provides the status of groundwater monitoring and corrective action program through December 2020 at Georgia Power Company's (Georgia Power's) Plant Bowen Ash Pond 1 (AP-1) (the Site). This summary was prepared by Geosyntec Consultants, Inc. (Geosyntec) on behalf of Georgia Power to meet the requirements listed in Part A, Section 6¹ of the U.S. Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D).

Plant Bowen is located at 317 Covered Bridge Rd SW, nine miles southwest of Cartersville in Bartow County, Georgia. Plant Bowen is a four-unit, coal-fired, electric-generating facility that commenced operations in the 1970s. CCR material resulting from power generation have historically been transferred and stored at the Site. In preparation for AP-1 closure, the plant completed the conversion to dry ash handling in early 2019 and AP-1 no longer receives ash. Georgia Power submitted to Georgia Environmental Protection Division (GA EPD) a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020. The Site is located on the western portion of the Plant Bowen property shown on Figure 1.

Figure 1. Plant Bowen and the Site

Georgia Power submitted to Georgia Environmental Protection Division (GA EPD) a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020. The Site is located on the western portion of the Plant Bowen property shown on Figure 1.

Groundwater at the Site is monitored using a monitoring system comprised of five upgradient and 17 downgradient wells installed between October 2015 and May 2020 that meet federal and state monitoring requirements. Routine sampling and reporting began after the background groundwater conditions were established between June 2016 and August 2017. Based on groundwater conditions at the Site, an assessment monitoring program and assessment of corrective measures were established in January 2018 and January 2019, respectively. During the 2020 annual reporting period, the Site remained in assessment monitoring as corrective measures were evaluated.

¹ 80 FR 21468, Apr. 17, 2015, as amended at 81 FR 51807, Aug. 5, 2016; 83 FR 36452, July 30, 2018; 85 FR 53561, Aug. 28, 2020

During the 2020 reporting period, Geosyntec conducted three groundwater sampling events in February, March, and September. Groundwater samples were submitted to Pace Analytical Services, LLC, for analysis. Per the CCR rule, groundwater results for March and September 2020 data were evaluated in accordance with the certified statistical methods. That evaluation showed statistically significant values of Appendix III² and Appendix IV³ parameters in wells provided in the table below.

Appendix III Parameter	March 2020	September 2020
Boron	BGWC-7, BGWC-8, BGWC-9, BGWC-10, BGWC-12, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30
Calcium	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-16, BGWC-17, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30	BGWC-7, BGWC-12, BGWC-14A, BGWC-16, BGWC-20, BGWC-22, BGWC-23, BGWC-24
Chloride	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30
pH	BGWC-7, BGWC-9, BGWC-12, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-25, BGWC-30	BGWC-16, BGWC-19, BGWC-22, BGWC-24
Sulfate	BGWC-7, BGWC-8, BGWC-9, BGWC-10, BGWC-12, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-21, BGWC-22, BGWC-23, BGWC-24, BGWC-30	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-19, BGWC-20, BGWC-22, BGWC-23, BGWC-24,
Total Dissolved Solids	BGWC-7, BGWC-9, BGWC-10, BGWC-12, BGWC-16, BGWC-17, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30	BGWC-7, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-20, BGWC-22, BGWC-23, BGWC-24, BGWC-30

² Boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS)

³ Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, selenium, thallium, and radium 226 + 228

Appendix IV Parameter ⁴	March 2020	September 2020
Arsenic	<i>Federal and State: BGWC-34D</i>	<i>Federal and State: BGWC-34D</i>
Cobalt	<i>Federal and State: BGWC-22</i>	<i>Federal and State: BGWC-22</i>
Molybdenum	<i>State only: BGWC-22</i>	<i>State only: BGWC-22, BGWC-38D</i>

An Alternate Source Demonstration (ASD) that presents multiple lines of evidence that the arsenic groundwater concentrations detected in well BGWC-34D are not associated with a release from AP-1 but are instead caused by a natural source of arsenic in the site-specific rock formation was prepared in January 2021 and provided in **Appendix C**. The ASD was also submitted under separate cover to GA EPD on January 29, 2021.

Based on review of the Appendix III and Appendix IV statistical results completed for the groundwater monitoring and corrective action program from January through December 2020, the Site will continue in assessment monitoring. Georgia Power will continue routine groundwater monitoring and reporting at the Site. Reports will be posted to the website and provided to GA EPD semiannually.

⁴ A state statistically significant level SSL-related constituent is determined by comparing the confidence intervals developed to either the constituent's MCL, if available, or the calculated background interwell prediction limit. A federal SSL-related constituent is determined by comparing the confidence intervals developed to either the constituent's MCL, if available, the USEPA RSL, if no MCL is available, or the calculated background interwell prediction limit.

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule [40 Code of Federal Regulations (CFR) Part 257, Subpart D] and the Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management 391-3-4-.10, Geosyntec Consultants (Geosyntec) has prepared this *2020 Annual Groundwater Monitoring & Corrective Action Report* to document groundwater monitoring activities conducted at Georgia Power Company (Georgia Power) Plant Bowen (Site) Ash Pond 1 (AP-1). GA EPD Rules for Solid Waste Management 391-3-4-.10(6)(a) adopt Federal CCR rule by reference. For ease of reference, the USEPA CCR rules are cited within this report. This report documents groundwater monitoring activities completed for AP-1 during the 2020 calendar year.

Due to statistically significant levels (SSLs) of cobalt and molybdenum identified in the *2018 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2019a), Georgia Power initiated an assessment of corrective measures (ACM) for AP-1 in January 2019. Pursuant to § 257.96(b), Georgia Power continues to monitor groundwater associated with AP-1 in accordance with the assessment monitoring program established for the unit in 2018, including semiannual monitoring and reporting pursuant to §§ 257.90 through 257.95 of the Federal CCR rule, and GA EPD Rules for Solid Waste Management 391-3-4-.10(6)(a).

1.1 Site Description and Background

Plant Bowen is a four-unit, coal-fired, electric-generating facility that commenced operations in the 1970s. The plant is located nine miles southwest of Cartersville in Bartow County, Georgia. The plant is bordered by the Etowah River to the north and east, and sparsely populated, forested, rural, and industrial land on the south and west (**Figure 1**).

AP-1 at the Site occupies an area of approximately 254 acres. In preparation for AP-1 closure, the plant completed the conversion to dry ash handling in early 2019 and AP-1 no longer receives ash. Georgia Power submitted to EPD a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020. Georgia Power will close AP-1 by excavation and consolidation of CCR material into an approximately 144-acre lined, multi-cell storage facility situated within the current footprint of AP-1. Closure activities will be conducted in accordance with § 257.102 and corresponding Rule 391-3-4-.10(7)(b). The proposed closure approach provides a source control measure that reduces the potential for migration of CCR constituents to

groundwater. Details of the closure approach have been summarized in the Amended Written Closure Plan and published in 2018 to Georgia Power's CCR Rule Compliance website.

1.2 Regional Geology & Hydrogeologic Setting

The following section summarizes the geologic and hydrogeologic conditions at the Site as described in the *Hydrogeologic Assessment Report (Revision 1) – AP-1* (HAR Rev 1) (Geosyntec, 2020c) prepared in support of the AP-1 solid waste handling permit.

1.2.1 Regional and Site Geology

The Site is located within the Great Valley District of the Valley and Ridge Physiographic Province (Valley and Ridge) in northwest Georgia. The Valley and Ridge is characterized by Paleozoic sedimentary rocks that have been folded and faulted into the ridges and valleys that gave this region its name. The floor of the valley is underlain by shales, dolomites, and limestones of Cambrian and Ordovician age. Geologic mapping performed by Lawton et al. (1976) indicates that the Site is underlain by the Ordovician-Cambrian age Knox Dolomite and the Ordovician age Newala Limestone. Based on review of subsurface investigations at the Site, the bedrock is described as predominantly dolomite. The overall Site is underlain primarily by residuum and competent dolomite/limestone bedrock. AP-1 is underlain primarily by three lithologic units: (i) fill material consisting of earthen embankments and CCR material, (ii) residuum, and (iii) competent dolomite/limestone bedrock.

Based on subsurface investigations, the residuum at the Site is the result of in-place weathering of the underlying dolomite/limestone bedrock. The residuum consists mainly of mottled light brown to red to yellow, low to high plasticity, stiff to very stiff clay, silt, and silty clay. Most soils contain varying amounts of black chert nodules and chert gravel. The bedrock beneath the Site is described as light to dark gray, fine to medium-grained, thinly bedded to massive, dense, and hard dolomite, limestone, and dolomitic limestone. Some evidence of weathering along fracture or bedding surfaces is observed, with some manganese or iron oxide staining. Abundant calcite veins and occasional zones of healed dolomite breccia are observed throughout the bedrock. Solution features such as voids in the underlying limestone/dolomite bedrock have formed in the bedrock over geological timeframes, primarily along pre-existing discontinuities such as joints and bedding planes. At the Site, these voids are typically filled with residuum from the in-place weathering of the bedrock or the downward migration of the overlying residuum,

but they may also be open, or water filled. When hydraulically interconnected these voids may create preferential groundwater flow paths across the Site.

1.2.2 Hydrogeologic Setting

The uppermost aquifer at the Site is a regional groundwater aquifer that occurs near the interface of the residuum and the fractured and solutioned bedrock. Groundwater recharge is by precipitation infiltrating through the residuum to bedrock, or in bedrock outcrop areas, it infiltrates directly into the bedrock. Groundwater flow in bedrock is under unconfined to semi-confined conditions from the mantle of overlying lower-permeability residuum and is controlled by secondary porosity along fractures and solution-enhanced features. Based on observations of residuum soil types and horizontal hydraulic conductivity values, the movement of groundwater in the residuum and upper weathered bedrock zone is slow and likely behaves as flow through low-permeability porous media. Groundwater flow in the underlying dolomite/limestone bedrock is likely controlled by preferential flow pathways associated with fractures and solution-enhanced joints and fissures.

1.3 Groundwater Monitoring Well Network

In accordance with § 257.91, a groundwater monitoring system was installed at AP-1 that (1) consists of a sufficient number of wells, (2) is installed at appropriate locations and depths to yield groundwater samples from the uppermost aquifer, and (3) represents the groundwater quality both upgradient of the unit (i.e., background conditions) and passing the waste boundary of the unit. The number, spacing, and depths of the groundwater monitoring wells were selected based on the characterization of site-specific hydrogeologic conditions.

The compliance monitoring well network for AP-1 currently consists of 22 monitoring wells. The original well network of 19 wells was certified by a professional engineer (PE) on October 17, 2017; the certification is maintained in the AP-1 Operating Record. The network was expanded in 2020 to include BGWA-33, BGWA-47D, and BGWA-48D. Per comments provided by GA EPD, two additional compliance wells (i.e., BGWC-51 and BGWC-52) on the southern end of AP-1 are scheduled to be installed in January 2021. The location of these and associated well installation documents will be provided with the next semiannual groundwater monitoring report.

As part of the assessment monitoring program, 13 additional groundwater monitoring wells have been installed since 2018 to provide additional data to characterize flow and

groundwater quality conditions downgradient of AP-1. At the time of the above well installation efforts, piezometer BGWA-6 was suitably located downgradient of a well reporting an SSL and was therefore reclassified as a delineation well. Prior to 2018, BGWA-6 had only been used for gauging groundwater levels. Pursuant to § 257.195(g)(1)(iv), the wells, classified as “delineation wells”, are sampled in addition to the compliance monitoring wells as part of the ongoing assessment groundwater monitoring program.

An on-site network of piezometers is used to gauge water levels to define groundwater flow direction and gradients. Currently, there are 16 piezometers used to gauge groundwater levels downgradient of AP-1.

The locations of the compliance monitoring wells, delineation wells, and piezometers are shown on **Figure 2**; well construction details are listed in **Table 1**.

2.0 GROUNDWATER MONITORING ACTIVITIES

In accordance with § 257.90(e), the following describes monitoring-related activities performed during January through December 2020 and discusses any change in status of the monitoring program. All groundwater sampling was performed in accordance with § 257.93.

2.1 Monitoring Well Installation and Maintenance

During the reporting period, Georgia Power installed two delineation wells (i.e., BGWC-42D and BGWC-43D) to vertically characterize molybdenum in well clusters BGWC-22/BGWC-35D/BGWC-37D and BGWC-30/BGWC-36D/BGWC-38D, respectively. Two additional delineation wells (i.e., BGWC-41D and BGWC-44D) were installed to vertically characterize molybdenum concentrations at deeper zones of the aquifer downgradient of BGWC-22 and BGWC-30, respectively. Two background compliance monitoring wells (i.e., BGWA-47D and BGWA-48D) were installed to characterize background groundwater conditions at two deeper intervals in the vicinity of background well BGWA-2. Due to excessive drawdown and high total dissolved solids repeatedly reported during prior sampling events, well BGWC-14 was deemed to be unrepresentative of conditions at AP-1. Georgia Power abandoned and replaced compliance well BGWC-14 with BGWC-14A in May 2020. The locations of the seven wells installed during this 2020 reporting period are shown on **Figure 2**; well construction details are also provided in **Table 1**. A well installation report that includes detailed boring and well construction logs for the installation of the seven wells installed in April and May 2020 was submitted to GA EPD under separate cover in July 2020 (Geosyntec, 2020e) and is provided in **Appendix A**.

During the 2020 reporting year, former characterization well BGWA-33 was reclassified as a compliance monitoring well based on a geochemical analysis completed in support of the ACM efforts. The geochemical analysis is summarized in the *Semiannual Remedy Selection and Design Progress Report* (Geosyntec, 2020g).

The AP-1 well network was re-surveyed by GEL Solutions May 26-June 2, 2020. The top of the PVC well casing [top of casing (TOC) elevation] and the survey pin installed at each well pad were surveyed to within 0.5-foot horizontal accuracy and to 0.01-foot vertical accuracy. The horizontal location (i.e., northings and eastings) was recorded in feet relative to the North America Datum of 1983 (NAD83) with the vertical elevation recorded in feet relative to the North American Vertical Datum of 1988 (NAVD88). The new survey data are incorporated into this report's applicable tables; a copy of the well

survey data certified by a Georgia-licensed surveyor is included with the well installation report provided in **Appendix A**. Additionally, a memorandum was prepared to update and modify well construction details based on the updated survey data and included updated boring and well construction logs for the entire AP-1 well network. The *September 2020 Well Installation Addendum* was submitted to GA EPD on September 29, 2020 (Geosyntec, 2020i).

The well and piezometer networks are inspected during each groundwater monitoring event. For this reporting period, inspections were conducted in February, March, and September. Inspections are conducted by the field sampling team using GA EPD-based inspection criteria. Any issues identified with the wells (e.g., clogged weep holes within the outer protective casing, faded well identification signage, rusted locks and/or latches, etc.) are addressed before the following groundwater sampling event. The well inspection forms are provided in **Appendix B**, with the exception of well BGWA-4 for September 2020. The piezometer could not be accessed at the time of inspection event due to construction activities in the area. Access to well BGWA-4 was available in January 2021, the associated well inspection form is also provided in **Appendix B**. Maintenance activities were completed on January 21, 2021. The repairs will be documented in forthcoming well inspection forms.

2.2 Assessment Monitoring

Georgia Power initiated an assessment monitoring program for groundwater at AP-1 in January 2018. Statistical analyses of the 2018 assessment monitoring groundwater data identified SSLs of cobalt in well BGWC-22 in excess of the federal and state groundwater protection standard (GWPS) and SSLs of molybdenum in wells BGWC-20, BGWC-22, BGWC-23, and BGWC-30 in excess of the state GWPS.

Pursuant to § 257.96, an ACM was initiated for AP-1 in January 2019. An *Assessment of Corrective Measures Report* (ACM Report) was subsequently prepared for AP-1 (Geosyntec, 2019b) and submitted to GA EPD in June 2019 and posted to the CCR compliance website in July 2019. In accordance with § 257.96(b), groundwater continues to be monitored at AP-1 under the assessment monitoring program while the ACM phase is implemented.

Since initiating the ACM, Georgia Power has undertaken multiple ACM-specific field investigations and data evaluation efforts to characterize the site and delineate concentrations of cobalt and molybdenum in groundwater at AP-1 pursuant to the Federal CCR rule and GA EPD Rules. However, GA EPD sent a Notice of Deficiency (NOD)

letter to Georgia Power on February 7, 2020, stating that vertical delineation of molybdenum at AP-1 wells had not been completed by the stipulated deadline. The letter requested that Georgia Power provide a new milestone schedule within 30 days that outlined methods to expeditiously meet the delineation requirement. Georgia Power submitted a response letter and the requested schedule to GA EPD on March 6, 2020 (Georgia Power, 2020).

Georgia Power submitted a subsequent delineation progress report to GA EPD on June 15, 2020, that documented the field investigation efforts and data analyses completed between February 7 and June 15, 2020, to vertically delineate molybdenum concentrations in groundwater (Geosyntec, 2020d). A delineation workplan was prepared from the work presented in the June 2020 progress report (Geosyntec, 2020h). The delineation workplan was submitted under separate cover to GA EPD in August 2020. GA EPD conditionally approved the delineation workplan on January 12, 2021, contingent upon receiving a certified version of the plan sealed by a qualified groundwater scientist. Georgia Power submitted a certified version of the delineation workplan on January 18, 2021 (Geosyntec, 2021). The proposed wells are scheduled for installation in the first quarter of 2021.

Regarding the routine assessment monitoring program, the initial annual Appendix IV sampling event at AP-1 was conducted in February 2020, with semiannual assessment monitoring events occurring in March 2020 and September 2020. The number of groundwater samples collected for analysis and the dates the samples were collected at AP-1 during this reporting period are summarized in **Table 2**. The analytical results are discussed in Section 3.0, while the statistical results are discussed in Section 4.0.

2.3 Additional Groundwater and Surface Water Sampling

Supplemental groundwater sampling events were conducted during the reporting period to collect additional data in support of the continued evaluation of corrective measures as presented in the ACM Report. The supplementary data will be used (i) to evaluate attenuation mechanisms and rates and aquifer capacity for attenuation; (ii) conduct geochemical fingerprinting of the groundwater relative to source water; and (iii) and establish a set of groundwater quality data for newly installed delineation wells. The scope of these additional efforts and associated results are presented in the *Semiannual Remedy Selection and Design Progress Report* provided in **Appendix D**.

In support of risk assessment efforts, Georgia Power collected surface water samples from three locations along Euharlee Creek downgradient of AP-1 on March 31, 2020. Surface

water samples were collected from six locations in January 5, 2021. The surface sampling locations and additional details are provided in **Appendix D**. The laboratory reports associated with the sampling events are provided in **Appendix E**.

During this reporting period, additional background samples were collected at BGWC-14A, BGWA-47D, BGWA-48D as shown in **Table 2**. For each event, the samples were analyzed for the complete list of Appendix III and Appendix IV constituents. The associated laboratory reports are provided in **Appendix E**, except for the December 2020 groundwater sampling event. The laboratory report for this event was not received with sufficient time to complete validation efforts for inclusion in this report and will be provided with the August 2021 semiannual report.

2.4 Alternate Source Demonstration

A demonstration document was prepared and submitted to GA EPD on July 30, 2019, to present an evaluation of the arsenic groundwater concentrations reported in excess of the maximum contaminant level (MCL) of 0.010 milligrams per liter (mg/L) for delineation well BGWC-34D (Geosyntec, 2019c). BGWC-34D was installed to vertically delineate molybdenum detected at compliance well BGWC-20. The demonstration document presented multiple lines of evidence that the arsenic groundwater concentrations detected in well BGWC-34D are not associated with a release from AP-1 but are instead caused by a natural source of arsenic in the site-specific rock formation. The demonstration document was also included as an appendix to the *2019 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2020a). Arsenic at BGWC-34D was identified as an SSL after the March 2020 statistical analysis. In order to formally address the updated arsenic SSL, an Alternate Source Demonstration (ASD) is provided as **Appendix C** and was submitted under separate cover to EPD on January 29, 2021.

3.0 SAMPLING METHODOLOGY & ANALYSES

The following section presents a summary of the field sampling procedures that were implemented and the groundwater sampling results that were obtained in connection with the assessment monitoring program conducted at AP-1 during this reporting period.

3.1 Groundwater Level Measurement

A synoptic round of depth-to-groundwater-level measurements were recorded from the AP-1 wells and piezometers during the three 2020 site-wide assessment monitoring events and used to calculate the corresponding groundwater elevations, which are presented in **Table 3**. The May/June 2020 survey data was used to calculate the groundwater elevations for all events. The February, March and September 2020 elevations reported using the new survey data are generally representative of the groundwater elevations reported for prior monitoring events.

The groundwater elevation data were used to prepare potentiometric surface maps for the three 2020 events, which are presented on **Figures 3, 4, and 5**. Groundwater flow pathways at the Site are expected to be influenced by solution features, fractures, and weathered zones in the upper bedrock. Interpretation of the potentiometric surface contours indicates that groundwater generally flows to the north, northwest, and west. A component of flow in the southernmost portion of AP-1 is to the south and west, likely due to groundwater mounding related to historical free water storage at the recycle pond at the southern end of AP-1 (now decommissioned).

3.2 Groundwater Gradient and Flow Velocity

Because of lithologic heterogeneity and anisotropic groundwater flow, groundwater velocity calculations using derivations of Darcy's Law, or other methods, may not capture the full range and distribution of flow velocities beneath and around AP-1. Groundwater flow velocity calculations are provided as a general estimate of groundwater flow velocity at the site based on available information and assumptions described below.

The groundwater hydraulic gradients within the residuum and fractured and solutioned bedrock of the uppermost aquifer beneath AP-1 were calculated using groundwater elevation data recorded in February, March, and September 2020, and along three main interpreted groundwater flow paths to account for changing flow directions underlying AP-1, as discussed in Section 3.1 (i.e., northwest, west, south/southwest). Hydraulic gradients were calculated between the following well pairs: APPZ-1R/APPZ-5R

(February), APPZ-1R/BGWC-17 (March), and APPZ-1R/BGWC-14A (September); APPZ-3R/BGWC-25; APPZ-2R/BGWC-40. The supporting calculations are presented in **Table 4**; the locations of the flow paths used in the calculations and associated potentiometric contour lines are shown on **Figures 3, 4, and 5**.

The calculated hydraulic gradient along the northwest, west, and south/southwest flow paths are 0.013 feet per foot (ft/ft), 0.020 ft/ft, and 0.016 ft/ft, respectively. These hydraulic gradients represent the calculated average of the February, March, and September 2020 events.

The approximate horizontal flow velocities along the northwest, west, and south/southwest flow paths were calculated using the following derivative of Darcy's Law. The calculations are presented on **Table 4**.

$$V = \frac{K_h * i}{n_e}$$

Where:

$$V = \text{Groundwater flow velocity} \left(\frac{\text{feet}}{\text{day}} \right)$$

$$K_h = \text{Horizontal Hydraulic Conductivity} \left(\frac{\text{feet}}{\text{day}} \right)$$

$$i = \text{Horizontal hydraulic gradient} \left(\frac{\text{feet}}{\text{feet}} \right)$$

$$n_e = \text{Effective porosity}$$

Because the geologic conditions at AP-1 are not homogenous or isotropic, and that the flow pathways are influenced by solution features, fractures, and weathered zones in the upper bedrock, groundwater flow velocities are variable. Based on the values presented in the HAR Rev 1, the horizontal hydraulic conductivity (K_h) values for the residuum range from 4.4×10^{-5} to 4.2×10^{-1} feet per day (ft/d), with a geometric mean of 7.0×10^{-3} ft/d. Horizontal hydraulic conductivity values measured for bedrock ranged from 3.0×10^{-2} to 33.0 ft/d, with a geometric mean of 2.4 ft/d. To be conservative, the flow velocities were calculated using the geometric mean K_h for weathered/fractured bedrock. Also, an estimated effective porosity of 0.30 for the fractured and solutioned dolomite/limestone bedrock was applied.

The calculated flow velocities along the northwest, west, and south/southwest flow paths are 0.10 ft/d, 0.16 ft/d, and 0.13 ft/d, respectively. These velocities were derived using the average hydraulic gradients presented above. Due to the hydrogeologic conditions affected by karst processes at the Site, the use of groundwater flow velocity calculations such as these may not be applicable; therefore, the above estimates should be considered a rough approximation.

3.3 Groundwater Sampling Procedures

Groundwater samples were collected from the compliance monitoring and delineation well networks using low-flow sampling procedures in accordance with § 257.93(a). Compliance wells were purged and sampled using an installed bladder pump with dedicated tubing; the delineation wells were sampled using a portable bladder pump equipped with new disposable polyethylene tubing. All non-disposable equipment was decontaminated before use and between well locations.

A SmarTROLL or Aqua TROLL (In-Situ field instrument) was used to monitor and record field water quality parameters listed below during purging to verify stabilization prior to sampling. Turbidity was measured using a LaMotte 2020we (or similar) portable turbidimeter. Groundwater samples were collected when the following stabilization criteria were met:

- pH \pm 0.1 Standard Units (s.u.).
- Conductivity \pm 5%.
- \pm 10% or \pm 0.2 mg/L (whichever is greater) for dissolved oxygen (DO) $>$ 0.5 mg/L. No criterion applies if DO $<$ 0.5 mg/L, record only.
- Turbidity measured less than 10 nephelometric turbidity units (NTU).

Once stabilization was achieved, samples were collected into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Pace Analytical Services, LLC. (Pace Analytical) in Norcross, Georgia following chain-of-custody protocol. The field sampling and equipment calibration forms generated during the 2020 assessment monitoring events are provided in **Appendix E**.

3.4 Laboratory Analyses

Laboratory analyses were performed by Pace Analytical, which is accredited by the National Environmental Laboratory Accreditation Program (NELAP). Pace Analytical maintains a NELAP certification for the Appendix III and Appendix IV parameters analyzed for this project. Analytical methods used for groundwater sample analysis are listed in the analytical laboratory reports included in **Appendix E**.

The groundwater analytical results from the February, March, and September 2020 assessment monitoring events, and the supplementary sampling of new compliance wells BGWC-14A, BGWA-47D, and BGWA-48D in May through November 2020, are summarized in **Table 5**. The Pace Analytical laboratory reports associated with the results presented in Table 5 are provided in **Appendix E**.

3.5 Quality Assurance & Quality Control Summary

Quality assurance/quality control (QA/QC) samples were collected during the groundwater monitoring events in accordance with the site's *Groundwater Monitoring Plan* (Geosyntec, 2020b), and included the following: field duplicates, equipment blanks, and field blank samples. QA/QC samples were collected in laboratory-provided bottles and submitted under the same chain of custody as the primary samples for analysis of the same parameters by Pace Analytical.

In addition to collecting QA/QC samples, the data were validated based on the pertinent methods referenced in the laboratory reports, professional and technical judgment, and applicable federal and site-specific guidance documents (USEPA, 2011; USEPA, 2017). Where necessary, the data were qualified with supporting documentation and justifications. The data are considered usable for meeting project objectives and the results are considered valid. The associated data validation reports are provided in **Appendix E** with the laboratory reports.

4.0 STATISTICAL ANALYSIS

The following section summarizes the statistical analysis of Appendix III groundwater monitoring data performed pursuant to § 257.93. In addition, pursuant to § 257.95(d)(2), Georgia Power established GWPS for the Appendix IV constituents and completed statistical analyses of the Appendix IV groundwater monitoring data obtained during the 2020 assessment monitoring events. The two reports generated from the analyses are provided in **Appendix F**. The 2020 groundwater data were analyzed by Groundwater Stats Consulting (GSC) (GSC, 2020, 2021).

4.1 Statistical Methods

Analytical data from the 2020 assessment monitoring events were statistically analyzed in accordance with the PE-certified Statistical Analysis Method Certification (October 2017, revised January 2020). The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision support software package, that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations and guidance as recommended in the Unified Guidance (USEPA, 2009).

Based on data evaluation completed in the *Semiannual Remedy Selection and Design Progress Report* (Geosyntec, 2020g), as described in Section 2.1, BGWA-33 is now considered a background compliance well. Groundwater data from BGWA-33 were statistically evaluated and subsequently incorporated as a background well in the statistical analysis conducted for the first assessment monitoring event reporting period (GSC, 2020). Data from background wells BGWA-47D and BGWA-48D were incorporated to the upgradient well data pool for the second assessment monitoring event reporting period (GSC, 2021).

Appendix III statistical analysis was performed to determine if Appendix III constituents have returned to background levels. Appendix IV constituents were evaluated to determine if concentrations statistically exceeded the established state and federal GWPS. Detailed statistical methods used for Appendix III and Appendix IV constituents are discussed in statistical analysis package provided in **Appendix F** and summarized in Sections 4.1.1 and 4.1.2. The GWPS were finalized pursuant to § 257.95(d)(2) and presented in **Table 6**.

4.1.1 Appendix III Statistical Methods

Statistical tests used to evaluate the groundwater monitoring data consist of interwell prediction limits combined with a 1-of-2 verification resample plan for each of the Appendix III parameters. Interwell prediction limits (PLs) pool upgradient well data to establish a background limit for an individual constituent, and the most recent sample from each downgradient well is compared to the same limit for each parameter. The most recent sample from each downgradient well is compared to the background limit to determine whether there are significant statistical increases (SSIs). An "initial exceedance" occurs when an Appendix III constituent reported in the groundwater of a downgradient compliance monitoring well exceeds the constituent's associated PL. The 1-of-2 resample plan allows for collection of an independent resample. A confirmed exceedance is noted only when the resample confirms the initial exceedance by also exceeding the statistical limit. If the resample falls within its respective prediction limit, no exceedance is declared.

4.1.2 Appendix IV Statistical Methods

To statistically compare groundwater data to GWPS, confidence intervals are constructed for each of the detected Appendix IV constituents in each downgradient compliance and delineation monitoring well with a minimum of 4 samples. In accordance with Section 21.1.1 of the Unified Guidance (USEPA, 2009), four independent data is the minimum population size recommended to construct confidence intervals required to assess SSLs for Appendix IV constituents.

Due to non-routine (or ACM investigation) sampling, some Appendix IV constituents at a well location may have differing number of data. At the time of this report, only the following delineation wells had four independent data to complete Appendix IV constituent list: BGWA-6, BGWC-31, BGWC-32, BGWC-34D, BGWC-35D, and BGWC-36D. The data set for delineation wells installed in 2019 and 2020 (BGWC-37D through BGWC-44D) are limited to less than four independent datums for the majority of the Appendix IV constituents and therefore those constituents are not subject to the statistical analyses. Due to non-routine sampling events in which select Appendix IV constituents were analyzed, confidence intervals could be constructed for the following delineation wells and specified Appendix IV constituents: BGWC-37D (molybdenum), BGWC-38D (molybdenum), BGWC-39 (cobalt, fluoride), and BGWC-40 (fluoride).

The confidence intervals are compared to both the state and federal GWPS. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its GWPS. If a confidence interval exceeds a GWPS, an SSL exceedance is identified.

USEPA revised the federal CCR Rule on July 30, 2018, updating GWPS for cobalt, lead, lithium, and molybdenum. As described in §§ 257.95(h)(1-3), the GWPS is:

- (1) The maximum contaminant level (MCL) established under §§ 141.62 and 141.66.
- (2) Where an MCL has not been established:
 - (i) Cobalt 0.006 mg/l;
 - (ii) Lead 0.015 mg/l;
 - (iii) Lithium 0.040 mg/l; and
 - (iv) Molybdenum 0.10 mg/l.
- (3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

USEPA's updated GWPS have not yet been incorporated under GA EPD's CCR Rule. GA EPD CCR Rule GWPS are:

- (1) The federally established MCL.
- (2) Where an MCL has not been established, the background concentration.
- (3) Background levels for constituents where the background level is higher than the MCL.

Following the above federal and state rule requirements, GWPS have been established for statistical comparison of Appendix IV constituents and are presented in **Table 6**.

4.2 Statistical Analyses Results

Based on review of the full Appendix III statistical analysis discussion presented in **Appendix F**, groundwater conditions have not returned to background and assessment monitoring should continue. Based on the statistical analysis of Appendix IV

constituents, the following constituents exceeded the state or federal GWPS for both 2020 assessment monitoring events:

AP-1 (Federal CCR Rule):

- Arsenic: BGWC-34D
- Cobalt: BGWC-22

AP-1 (GA EPD CCR Rule):

- Arsenic: BGWC-34D
- Cobalt: BGWC-22
- Molybdenum: BGWC-22 and BGWC-38D

As presented in **Appendix F**, the inclusion of BGWA-33 as a background compliance well resulted in the recalculation of the state GWPS for molybdenum. The new state GWPS is based on a background molybdenum concentration of 0.034 mg/L reported in BGWA-33. The federal GWPS of 0.10 mg/L remains unchanged since the background concentration is less. Under the new state GWPS, analysis of the 2020 data set did not identify an SSL of molybdenum in wells BGWC-20, BGWC-23, and BGWC-30, as seen historically.

The identified SSLs of cobalt and molybdenum in BGWC-22 are consistent with the 2019 reporting year statistical results. The arsenic SSL in BGWC-34D in excess of the state and federal GWPS is addressed with the ASD included in **Appendix C**. The SSL of molybdenum in BGWC-38D in excess of the state GWPS was identified for the September 2020 data set. A groundwater exceedance notification acknowledging the March 2020 SSLs was placed in the Operating Record on August 31, 2020, pursuant to § 257.95(g). The notification for September SSLs was placed in the Operating Record on January 29, 2021.

4.3 Delineation Data

The current 2020 data indicate that the SSL of cobalt associated with BGWC-22 is horizontally and vertically delineated to below the state and federal GWPS by delineation wells BGWC-39 and BGWC-35D, respectively, and contained within the property boundary of Plant Bowen. Similarly, current data indicate that the SSL of molybdenum

associated with BGWC-22 is horizontally and vertically delineated to below the state and federal GWPS by delineation wells BGWC-32 and BGWC-35D, respectively.

The molybdenum concentration in BGWC-38D is horizontally delineated to below the state GWPS by well BGWC-44D; vertical delineation is pending the installation of deeper characterization wells, scheduled to occur in first quarter of 2021, as described in the delineation workplan (Geosyntec, 2021) discussed in Section 2.2. Well BGWC-49D is proposed to be installed as a vertical characterization well located adjacent to BGWC-38D and BGWC-43D. The second characterization well, BGWC-50D, is proposed to horizontally characterize groundwater conditions downgradient of and at the same general elevation as BGWC-43D. The anticipated location of BGWC-50D is adjacent to well BGWC-44D.

Georgia Power will continue to monitor the delineation wells and adaptively manage the Site as new data become available. At this time, concentrations of Appendix IV constituents above the state and federal GWPS are delineated to within the property boundary by delineation wells BGWA-6, BGWC-40, BGWC-39, BGWC-41D, and BGWC-44D.

5.0 MONITORING PROGRAM STATUS

5.1 Assessment Monitoring Status

Pursuant to § 257.96(b), Georgia Power will continue to monitor the groundwater at AP-1 in accordance with the assessment monitoring program regulations of § 257.95 while ACM efforts are implemented to evaluate SSL concentrations of cobalt and molybdenum in select AP-1 wells. Pursuant to § 257.195(g)((1)(iv), the additional delineation wells will continue to be sampled as part of the ongoing assessment groundwater monitoring program.

5.2 Assessment of Corrective Measures

The ACM efforts completed during the reporting period covered by this groundwater monitoring and corrective action report are presented in the *Semiannual Remedy Selection and Design Progress Report* provided in **Appendix D**. The Semiannual Progress Report summarizes:

- (i) the current conceptual site model applicable to evaluating groundwater corrective measures proposed in the ACM Report (Geosyntec, 2019b);
- (ii) the analytical data obtained during supplemental ACM-specific field investigations;
- (iii) the status of evaluating applicable corrective measures; and
- (iv) the planned activities and anticipated schedule for the following semi-annual reporting period.

Georgia Power will include future Semiannual Progress Reports with each groundwater monitoring and corrective action report.

6.0 CONCLUSIONS & FUTURE ACTIONS

This *2020 Annual Groundwater Monitoring & Corrective Action Report* for Plant Bowen AP-1 was prepared to fulfill the requirements of USEPA's CCR Rule and GA EPD Rules for Solid Waste Management 391-3-4-.10. Statistical evaluations of the groundwater monitoring data for AP-1 confirmed the continued presence of SSLs of cobalt and molybdenum in AP-1 compliance monitoring well BGWC-22. The current groundwater data indicate the SSLs associated with BGWC-22 are horizontally and vertically delineated to below the state and federal GWPS by delineation wells BGWC-32/BGWC-39 and BGWC-35D, respectively, and contained within the property boundary of Plant Bowen. No SSLs of molybdenum were identified in BGWC-20, BGWC-23, and BGWC-30 as was historically the case.

The statistical analyses identified an SSL of arsenic in delineation well BGWC-34D for both of the 2020 semiannual assessment monitoring events. An ASD is provided in **Appendix C** that presents multiple lines of evidence that illustrate the groundwater arsenic detections are associated with naturally occurring arsenic within the localized rock formation. The ASD is an amended version of the demonstration document submitted to GA EPD in July 2019.

An SSL of molybdenum above the state GWPS was identified in delineation well BGWC-38D for the September 2020 assessment monitoring event. Current groundwater data indicate that the molybdenum SSL is horizontally delineated to below the state GWPS by delineation well BGWC-44D. Georgia Power will install additional characterization wells in the first quarter of 2021 to further characterize Appendix III and IV constituents in vicinity of BGWC-38D and BGWC-43D.

The initial annual Appendix IV sampling event is scheduled to occur in February 2021, with the first semiannual assessment monitoring event tentatively planned for March 2021. Additional groundwater monitoring and delineation activities in support of the ACM efforts may occur in the interim as described in the *Semiannual Remedy Selection and Design Progress Report* provided in **Appendix D**.

Notes:

ft = feet

ft BTOC = feet below top of casing

(1) Coordinates in North American Datum (NAD) 1983, State Plane, Georgia-West, feet. Survey completed by GEL Solutions obtained June 10, 2020.

(2) Elevations referenced to the North American Vertical Datum of 1988 (NAVD88). Survey completed by GEL Solutions obtained June 10, 2020.

(3) Total well depth accounts for sump if data provided on well construction logs.

(4) Monitoring well BGWC-14 was abandoned on May 17, 2020, and replaced with BGWC-14A.

Notes:

(1) Well abandoned on May 17, 2020.

(2) Well installed May 4, 2020, as a replacement for BGWC-14.

(3) Monitoring well analyzed for the complete list of Appendix III and Appendix IV constituents to establish background groundwater quality in compliance with 40 CFR 257.93.

Notes:

- = Not applicable

-- = Well not installed at the time of the event.

ft = feet

ft BTOC = feet below top of casing

(1) Elevations referenced to the North American Vertical Datum of 1988 (NAVD88).

(2) Survey completed by GEL Solutions obtained June 10, 2020.

(3) Well abandoned on May 17, 2020 . BGWC-14 was deemed to be unrepresentative of conditions at AP-1 and therefore, groundwater elevations were not used in development of groundwater contours on Figures 3 and 4 .

(4) Well installed May 4, 2020, as a replacement for BGWC-14.

	K_h (ft/d)	n	$\Delta h/\Delta l$ (ft/ft)	V (ft/d) ⁽³⁾
Northwest Flow Path (APPZ-1R to APPZ-5R/BGWC-17/BGWC-14A) ⁽²⁾	2.4	0.3	0.013	0.10
West Flow Path (APPZ-3R to BGWC-25)	2.4	0.3	0.020	0.16
South/Southwest Flow Path (APPZ-2R to BGWC-40)	2.4	0.3	0.016	0.13

Notes:

ft = feet

ft/d = feet per day

ft/ft = feet per foot

h_1, h_2 = point of interpreted groundwater elevation

$\Delta h/\Delta l$ = hydraulic gradient

K_h = horizontal hydraulic conductivity

Δl = distance between location 1 and 2

n = effective porosity

V = groundwater flow velocity

(1) Flow path direction relative to the orientation of AP-1 and illustrated on Figures 3, 4, and 5 of associated report.

(2) Velocity was calculated between APPZ-1R and APPZ-5R, BGWC-17, and BGWC-14A in February, March, and September 2020, respectively.

(3) Groundwater flow velocity equation: $V = [K_h * (\Delta h/\Delta l)] / n$

Notes:

-- = Parameter was not analyzed

J = Indicates the parameter was estimated and detected between the method detection limit (MDL) and the reporting limit (RL)

< = Indicates the parameter was not detected above the analytical MDL

TDS = total dissolved solids

U = Indicates the parameter was not detected above the analytical minimum detectable concentration (MDC) (Specific to combined radium 226/228)

(1) Appendix III/IV parameter per 40 CFR 257 Subpart D. Parameters are reported in units of milligrams per liter (mg/L), except for pH reported as s.u. (standard units) and combined radium reported as picocuries per liter (pCi/L).

(2) Metals were analyzed by EPA Method 6010D/6020B, mercury was analyzed by EPA Method 7470A, anions were analyzed by EPA Method 300.0, TDS was analyzed by SM2540C, and combined radium 226/228 by EPA Methods 9315/9320. The pH value presented was recorded at the time of sample collection in the field.

(3) Monitoring wells BGWC-14A, BGWA-47D, and BGWA-48D were analyzed for the complete list of Appendix III and Appendix IV constituents to establish background groundwater quality in compliance with 40 CFR 257.93. The wells will be sampled in this manner for eight independent events.

(4) Well installed May 4, 2020, as a replacement for BGWC-14.

(5) Well serves as a delineation monitoring well.

(6) The value exceeds the Maximum Contaminant Level (MCL) for arsenic (0.010 mg/L). An alternate source demonstration documenting a naturally occurring source is included in Appendix D.

(7) The value exceeds the Maximum Contaminant Level (MCL) for arsenic (0.010 mg/L). Due to the limited data set for this well, a statistical analysis cannot be performed yet. Therefore, monitoring will continue until population size is large enough to run statistical analysis following EPA Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance (2009).

Thallium	mg/L	0.0010	0.002	0.002
Combined Radium-226/228	pCi/L	1.8	5	5

Notes:

"mg/L" = milligrams per liter

"pCi/L" = picocuries per liter

1. Statistical analyses were performed on semiannual monitoring events for data through May 2020 and data through November 2020.
2. The background limits were used when determining the groundwater protection standard (GWPS) under 40 CFR 257.95(h) and Georgia Environmental Protection Division (EPD) Rule 391-3-4-.10(6)(a). Where two numbers are present, they denote the different background concentrations for each of the two semiannual monitoring events in the order that they were determined.
3. Under 40 CFR 257.95(h)(1-3) the GWPS is: (i) the maximum contaminant level (MCL) established under §§141.62 and 141.66 of this title; (ii) where an MCL has not been established a rule-specific GWPS; or (iii) background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.
4. Under the existing EPD rules, the GWPS is: (i) the MCL; (ii) where the MCL is not established, the background concentration; or (iii) background concentrations for constituents where the background concentration is higher than the MCL.

LEGEND

- Compliance Monitoring Well
- Horizontal Delineation Monitoring Well
- Vertical Delineation Monitoring Well
- Piezometer
- Groundwater Elevation Contour
- Approximate Groundwater Flow Direction

Notes:

1. Water level elevations recorded on February 17, 2020. Elevation provided in feet referenced to the North American Vertical Datum (NAVD) 88. The Recycle Pond water elevation is currently below the measuring threshold of the installed gauge. Based on information provided by GPC, the lowest elevation that the gauge can measure is 699 ft NAVD.
2. The map shows only the wells/piezometers currently installed at the time of the gauging event.
3. BGWC-14 was deemed to be unrepresentative of conditions at AP-1 and therefore, groundwater elevations were not used in development of groundwater contours.
4. Aerial photograph source: Google Earth Pro, November 2019.

The Recycle Pond water elevation is currently below the measuring threshold of the installed gauge. Based on information provided by Georgia Power, the lowest elevation that the gauge can measure is 699 ft NAVD.
2. The map shows only the wells/piezometers currently installed at the time of the gauging event.
3. Water elevation in parentheses is not used in development of groundwater contours due to well being screened at a different elevation in the formation/aquifer.
4. Aerial photograph source: Google Earth Pro, November 2019.

1. INTRODUCTION

This report provides details regarding the design, installation, and development of seven groundwater monitoring wells to supplement the current groundwater monitoring system at Georgia Power Company (GPC) Plant Bowen (Site) Ash Pond 1 (AP-1). Four wells (BGWC-41D, BGWC-42D, BGWC-43D, BGWC-44D) were installed to vertically characterize wells BGWC-22, BGWC-23, and BGWC-30, respectively. Two upgradient wells (BGWA-47D, BGWA-48D) were installed to characterize groundwater conditions at two deeper intervals in the vicinity of compliance upgradient well BGWA-2. Compliance monitoring well BGWC-14 was abandoned and replaced with BGWC-14A. This report was prepared as an addendum to previously issued well certification reports prepared for the Site (Anchor QEA, 2017; Geosyntec, 2019, Geosyntec, 2020), and meets the requirements promulgated in the United States Environmental Protection Agency (US EPA) coal combustion residual (CCR) rule [40 Code of Federal Regulations (CFR) Part 257, Subpart D], specifically 40 CFR §257.91(e)(1) and Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management 391-3-4-.10.

Plant Bowen is a four-unit, coal-fired, electric-generating facility located nine miles southwest of Cartersville in Bartow County, Georgia. The current groundwater monitoring system at AP-1 includes 21 wells associated with the certified CCR compliance monitoring well network and a network of secondary groundwater monitoring wells and groundwater level monitoring piezometers. The locations of these wells and piezometers are shown on **Figure 1**.

2. DRILLING AND WELL INSTALLATION

Well installation and development activities were performed according to accepted industry standards and following guidelines within the *Manual for Groundwater Monitoring* (GA EPD, 1991). Well drilling, installation, and surface completion activities were performed by Cascade Drilling, Inc of Midland, North Carolina under contract with, and the supervision of, Southern Company Services (SCS) Civil Field Services (CFS) personnel. In accordance with the Georgia Water Well Standards Act, the driller was required to have an insurance bond on file with the State of Georgia at the time of drilling. A copy of this bond is provided in **Appendix A**. CFS personnel oversaw the drilling and installation efforts. Resolute Environmental & Water Resources Consulting was responsible for developing the newly installed wells. A professional geologist employed with Geosyntec Consultants (Geosyntec) and registered to practice in the State of Georgia documented the drilling and installation efforts to record observations, soil and rock descriptions, subsurface stratigraphy, water elevations, and other field activities.

AP-1 area wells were installed in April and May 2020. Monitoring BGWC-14 was abandoned and replaced with BGWC-14A in May 2020. The locations of wells BGWC-14A, BGWC-41D, BGWC-42D, BGWC-43D, BGWC-44D, BGWA-47AD, and BGWA-48D are shown on **Figure 1**. Well construction details are provided in **Table 1**; boring and well construction logs are included in **Appendix B1**.

2.1 Drilling Method

Drilling methods used for borehole advancement were rotosonic drilling techniques with continuous core collection. Care was taken so that the drilling methods minimized the disturbance of subsurface materials and did not allow contamination of the groundwater. Drilling equipment was pressure washed between each well.

2.2 Screened Interval

Details regarding the well screen intervals are provided in **Table 1**. Wells are screened in the uppermost water bearing unit from approximately 631 to 534 feet (ft) (referenced to the North American Vertical Datum of 1988). All wells are constructed with 10 feet of well screen.

2.3 Well Casings and Screens

The wells are constructed of 2-inch inner diameter Schedule 40 polyvinyl chloride (PVC) casing with flush-threaded fittings. Each well was installed with a 10-foot nominal length

pre-packed dual-wall well screen with 0.010-inch slots. The casings and screens arrived pre-cleaned and packaged by the manufacturer. The pre-packed well screen was constructed onsite by packing sand between slotted PVC and the well screen. Well construction materials are sufficiently durable to resist chemical and physical degradation and not interfere with the quality of groundwater samples. Casing and screens are flush-threaded. Solvent or glue was not used to construct the wells. A 4-inch long threaded bottom cap was attached to the bottom of the screen. The PVC products used were American Society for Testing and Materials (ASTM) and National Sanitation Foundation (NSF) rated. Well screen interval details are provided in **Table 1**.

2.4 Well Intake Design

Wells were designed and constructed to: (1) allow sufficient groundwater flow to the well for sampling; (2) minimize the passage of formation materials (turbidity) into the wells; and (3) ensure sufficient structural integrity to prevent collapse of the well. The annular space between the face of the formation and the screen was filled to minimize passage of formation materials into the wells. A filter pack of clean, well-rounded, quartz sand was installed in each well. The 0.01-inch slot size was selected to minimize the inflow of formation material without impairing influent groundwater flow.

2.5 Filter Pack

Highly Pure Quartzite of Southern Products & Silica Co. silica sand filter pack was used as the appropriate gradation for all wells. Highly Pure Quartzite meets the ASTM D5092 uniformity coefficient specification of 2.5 or less, with a uniformity coefficient of 1.6.

Filter pack material was placed within the pre-packed dual-wall well screens and in the annular space between the outside of the pre-pack screen and borehole wall to ensure an adequate thickness of filter pack material between the well and the formation. Filter pack material placed in the annular space outside of the well screen extended approximately 2 to 3 feet above the top of screen. No bridging occurred during filter pack placement.

Upon placement of the filter pack, each well was pumped with a submersible pump to assure settlement of the filter pack. The top of filter pack depth was measured following pumping to ensure appropriate extension of filter sand above the screen. The depth of top of filter pack was measured and recorded on the well construction logs provided in **Appendix B1**.

2.6 Annular Seal

A minimum of two feet of bentonite pellets (PelPlug non-coated 3/8-inch bentonite pellets) were placed immediately above the filter pack by gravity-pouring into the annular space and hydrated per manufacture's specifications. A tremie pipe was used to probe the annular space to ensure that no bridging occurred. Following the hydration period, the bentonite seal was extended, if warranted by the presence of softer geologic material or voids above the filter pack, to at least one foot above the residual soil/bedrock contact observed to prevent bentonite grout from entering the water-bearing or screened zone. The bentonite was hydrated with potable water for a duration meeting or exceeding the manufacture's specifications prior to grouting the remaining annulus.

The annulus above the bentonite seal was grouted with Aqua Guard bentonite grout placed via tremie pipe from the top of the bentonite seal. During grouting, care was taken to assure that the bentonite seal was not disturbed by locating the base of the tremie pipe approximately 2 feet above the bentonite seal and injecting grout at low pressure/velocity. A cement apron 4-feet by 4-feet by 4-inches was poured around each well. The pad is mounded slightly outward to direct surface drainage away from the well.

2.7 Cap and Protective Casing

The well risers were fitted with a locking cap and a lockable cover. A one-quarter inch vent hole was drilled into the PVC riser pipe to provide an avenue for the escape of gas. The protective cap guards the casing from damage and the locking cap serves as a security device to prevent well tampering. Bollards were installed around the four corners of the concrete pad to protect the well.

A weep hole was drilled in the outer protective casing near the bottom above the concrete pad. Pea gravel was placed inside the protective casing between the riser pipe and the outer casing. Wells are clearly marked with the proper well identification number on the stand-up casing. Construction details are documented on the well construction logs provided in **Appendix B1**.

3. WELL DEVELOPMENT

Monitoring wells were developed using a combination of surging and pumping to (1) restore the natural hydraulic conductivity of the formation, and (2) to remove fine-grained sediment to ensure low-turbidity groundwater samples. Wells were alternately surged and purged until visually clear of particulates. Turbidity, pH, temperature, conductivity, oxidation-reduction potential (ORP), and dissolved oxygen (DO) measurements were recorded to ensure that each well was fully developed. The development forms are included in **Appendix C**.

All equipment and tubing placed in the well was decontaminated or disposed of between wells.

4. WELL ABANDONMENT

Monitoring well BGWC-14 was properly abandoned in place following the completion of replacement well BGWC-14A.

PelPlug time-release-coated 3/8-inch bentonite pellets were placed within the 2-inch PVC casing by gravity-pouring. The bentonite pellets were added to the well casing to approximately 3 feet above the top of screen to prevent bentonite grout from entering the water bearing zone of the replacement well. A tremie pipe was used to probe the PVC to ensure that no bridging occurred. Following the manufacture's specified hydration period, BGWC-14 was sealed by gravity pouring Type I/II Portland Cement into the open PVC casing until it was filled to the surface.

Following grouting of BGWC-14 the concrete pad and the protective well riser were pulled from the hole in one piece. The remaining aboveground PVC casing was cut back to approximately 2 feet below ground surface and the open borehole and casing topped with cement grout. The well abandonment log for BGWC-14 is provided in **Appendix B2**.

5. SURVEY

Upon completion of the well installation, the horizontal locations and vertical elevations were surveyed by a Georgia-licensed surveyor. The top of the PVC well casing [top of casing (TOC) elevation] and the survey pin installed at each well pad were surveyed to within 0.5-foot horizontal accuracy and to 0.01-foot vertical accuracy. The horizontal location (i.e., northings and eastings) was recorded in feet relative to the North America Datum of 1983 (NAD) with the vertical elevation recorded in feet relative to the North American Vertical Datum of 1988. Certified survey data are provided in the well construction table (**Table 1**). A copy of the certified well survey data for the AP-1 well network is provided in **Appendix D**.

APPENDIX B2

Well Abandonment Log

WELL ABANDONMENT DATA

PROJECT: Plant Bowen Ash Pond Well Abandonment	WELL NO.: BGWC-14
SITE: Plant Bowen	COORDINATES: N:1505406.14 E: 2065043.82
FORM PREPARED BY: Christine Hug (Geosyntec Consultants) ABANDONMENT BY: Isaac Young (Cascade Drilling)	DATE ABANDONED: 5/17/2020
METHOD OF FILLING: Fill with bentonite chips to 3 ft above screen and grouted in place.	VOLUME USED: Bentonite: 22 lbs (2.2 gallon) Cement grout: 15 gallon
DEPTH SOUNDED PRIOR TO FILLING/GROUTING: 88.5 ft bTOC (86.26 ft bgs)	DEPTH TO WATER PRIOR TO ABANDONMENT: 74.91 ft bTOC (72.17 ft bgs)

TOC Elevation: 718.77

	DEPTH:	ELEV.:
GROUND SURFACE	0.0'	716.03'
TOP OF SCREEN	75.76'	640.27'
BOTTOM OF WELL	85.76'	630.27'

Notes:
ft bTOC = Feet below top of PVC casing
ft bgs = feet below ground surface

REMARKS:

Placed 3/8" bentonite chips to 72.5 ft below ground surface (approx. 3 ft above screen interval).
Hydrated bentonite chips for three days.
Added Type I/II Portland Cement grout into PVC casing and filled to surface.
Removed bollards, concrete pad and protective well riser, and cut remaining PVC casing back to approx. 2 feet below ground surface.
Topped of open borehole with cement grout.

Certified By:

Date: 7/15/2020

Samples

Sample ID:	Description:
------------	--------------

Product Name: Low-Flow System

Date: 2020-04-30 16:02:13

Project Information:

Operator Name William Laaker
Company Name Resolute
Project Name Ash Pond Well Development
Site Name Plant Bowen
Latitude 0° 0' 0"
Longitude 0° 0' 0"
Sonde SN 646770
Turbidity Make/Model LaMotte 2020

Pump Information:

Pump Model/Type GeoTech Reclaimer
Tubing Type LDPE
Tubing Diameter 0.625 in
Tubing Length 148.79 ft

Pump placement from TOC 137.79 ft

Well Information:

Well ID BGWC-44D WD
Well diameter 2 in
Well Total Depth 142.79 ft
Screen Length 10 ft
Depth to Water 32.36 ft

Pumping Information:

Final Pumping Rate 650 mL/min
Total System Volume 10.72644 L
Calculated Sample Rate 240 sec
Stabilization Drawdown 622.68 in
Total Volume Pumped 13 L

SURVEY DATA CERTIFICATION FOR SOUTHERN COMPANY TO DETERMINE NORTHING, EASTING, AND VERTICAL ELEVATION OF THE NAIL IN THE CONCRETE PAD & THE PVC WELL CASING. DATE OF FIELD SURVEY & INSPECTION: 05/26/2020-06/02/2020. FIELD SURVEY POSITIONAL TOLERANCE=0.5 FEET HORIZONTAL-NAD'83, 0.01 VERTICAL-NAVD '88. EQUIPMENT USED FOR HORIZONTAL LOCATION: TRIMBLE R10 RTK GPS & TRIMBLE S5 ROBOTIC TOTAL STATION. THE VERTICAL LOCATION OF EACH SURVEYED POINT WAS ESTABLISHED BASED UPON LEVEL RUNS WITH A DIGITAL LEVEL LOOP FROM VERTICAL CONTROL ESTABLISHED BY ON-SITE BENCHMARK BM-B1 SET BY GEL SOLUTIONS USING A TRIMBLE DINI LEVEL

Jimmy R. Toole

Well Inspection Forms

Groundwater Monitoring Well Integrity Form

Site Name Plant Bower
 Permit Number _____
 Well ID BGWA-1
 Date, field conditions 2/17/20, 44°F & Overcast

		yes	no	n/a
1 Location/Identification				
a	Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?				
		<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

7 Corrective actions as needed, by date:

c	Is the well in a high traffic area and does the well require protection from traffic?		<u>X</u>	
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<u>X</u>		
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<u>X</u>		
b	Is the casing free of degradation or deterioration?	<u>X</u>		
c	Does the casing have a functioning weep hole?	<u>X</u>		
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<u>X</u>		
e	Is the well locked and is the lock in good condition?	<u>X</u>		
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<u>X</u>		
b	Is the well pad sloped away from the protective casing?	<u>X</u>		
c	Is the well pad in complete contact with the protective casing?	<u>X</u>		
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<u>X</u>		
e	Is the pad surface clean (not covered with sediment or debris)?	<u>X</u>		
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<u>X</u>		
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<u>X</u>		
c	Is the well properly vented for equilibration of air pressure?	<u>X</u>		
d	Is the survey point clearly marked on the inner casing?	<u>X</u>		
e	Is the depth of the well consistent with the original well log?	<u>X</u>		
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<u>X</u>		
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<u>X</u>		
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<u>X</u>		
c	Does the well require redevelopment (low flow, turbid)?		<u>X</u>	
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<u>X</u>

c Does the casing have a functioning weep hole?	<u>X</u>	_____	_____
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<u>X</u>	_____	_____
e Is the well locked and is the lock in good condition?	<u>X</u>	_____	_____
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<u>X</u>	_____	_____
b Is the well pad sloped away from the protective casing?	<u>X</u>	_____	_____
c Is the well pad in complete contact with the protective casing?	<u>X</u>	_____	_____
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<u>X</u>	_____	_____
e Is the pad surface clean (not covered with sediment or debris)?	<u>X</u>	_____	_____
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<u>X</u>	_____	_____
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<u>X</u>	_____	_____
c Is the well properly vented for equilibration of air pressure?	<u>X</u>	_____	_____
d Is the survey point clearly marked on the inner casing?	<u>X</u>	_____	_____
e Is the depth of the well consistent with the original well log?	<u>X</u>	_____	_____
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<u>X</u>	_____	_____
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<u>X</u>	_____	_____
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<u>X</u>	_____	_____
c Does the well require redevelopment (low flow, turbid)?	_____	<u>X</u>	_____
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<u>X</u>	_____	_____

2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c	Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7	Corrective actions as needed, by date:	_____

d Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing			
a Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

		yes	no	n/a
1 Location/Identification				
a	Is the well visible and accessible?	<u>X</u>	_____	_____
b	Is the well properly identified with the correct well ID?	<u>X</u>	_____	_____
c	Is the well in a high traffic area and does the well require protection from traffic?	_____	<u>X</u>	_____
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<u>X</u>	_____	_____
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<u>X</u>	_____	_____
b	Is the casing free of degradation or deterioration?	<u>X</u>	_____	_____
c	Does the casing have a functioning weep hole?	<u>X</u>	_____	_____
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<u>X</u>	_____	_____
e	Is the well locked and is the lock in good condition?	<u>X</u>	_____	_____
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<u>X</u>	_____	_____
b	Is the well pad sloped away from the protective casing?	<u>X</u>	_____	_____
c	Is the well pad in complete contact with the protective casing?	<u>X</u>	_____	_____
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<u>X</u>	_____	_____
e	Is the pad surface clean (not covered with sediment or debris)?	<u>X</u>	_____	_____
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<u>X</u>	_____	_____
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as ballers)?	<u>X</u>	_____	_____
c	Is the well properly vented for equilibration of air pressure?	<u>X</u>	_____	_____
d	Is the survey point clearly marked on the inner casing?	<u>X</u>	_____	_____
e	Is the depth of the well consistent with the original well log?	<u>X</u>	_____	_____
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<u>X</u>	_____	_____
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<u>X</u>	_____	_____
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	_____	_____	<u>X</u>
c	Does the well require redevelopment (low flow, turbid)?	_____	<u>X</u>	_____
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<u>X</u>	_____	_____

2 Protective Casing			
a Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7 Corrective actions as needed, by date:

3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<u>X</u>	_____	_____
b	Is the well pad sloped away from the protective casing?	<u>X</u>	_____	_____
c	Is the well pad in complete contact with the protective casing?	<u>X</u>	_____	_____
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<u>X</u>	_____	_____
e	Is the pad surface clean (not covered with sediment or debris)?	<u>X</u>	_____	_____
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<u>X</u>	_____	_____
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<u>X</u>	_____	_____
c	Is the well properly vented for equilibration of air pressure?	<u>X</u>	_____	_____
d	Is the survey point clearly marked on the inner casing?	<u>X</u>	_____	_____
e	Is the depth of the well consistent with the original well log?	<u>X</u>	_____	_____
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<u>X</u>	_____	_____
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<u>X</u>	_____	_____
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<u>X</u>	_____	_____
c	Does the well require redevelopment (low flow, turbid)?	_____	<u>X</u>	_____
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?				
		<u>X</u>	_____	_____

7 Corrective actions as needed, by date:

d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	_____	<u>X</u>	_____
e	Is the pad surface clean (not covered with sediment or debris)?	_____	_____	<u>X</u>
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<u>X</u>	_____	_____
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<u>X</u>	_____	_____
c	Is the well properly vented for equilibration of air pressure?	<u>X</u>	_____	_____
d	Is the survey point clearly marked on the inner casing?	<u>X</u>	_____	_____
e	Is the depth of the well consistent with the original well log?	_____	_____	<u>X</u>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	_____	<u>X</u>	_____
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	_____	_____	<u>X</u>
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	_____	_____	<u>X</u>
c	Does the well require redevelopment (low flow, turbid)?	_____	_____	<u>X</u>
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	<u>X</u>	_____	_____

7 Corrective actions as needed, by date:

Site Name Plant Bowen AP
 Permit Number _____
 Well ID BGWA-2
 Date 9/23/20

		yes	no	n/a
1 Location/Identification				
a	Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d	Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing				
a	Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad				
a	Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c	Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d	Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e	Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

 Date 9/24/20

	yes	no	n/a
1 Location/Identification			
a Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well in a high traffic area and does the well require protection from traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing			
a Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

4 Internal casing				
a	Does the cap prevent entry of foreign material into the well?		X	
b	Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	✓		
c	Is the well properly vented for equilibration of air pressure?	✓		
d	Is the survey point clearly marked on the inner casing?	✓		
e	Is the depth of the well consistent with the original well log?	✓		
f	Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	✓		
5 Sampling: Groundwater Wells Only:				
a	Does well recharge adequately when purged?	✓		
b	If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	✓		
c	Does the well require redevelopment (low flow, turbid)?		✓	
6	Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?	✓		

small ant hills on two sides of pad

-Ants nesting in stick up & under cap.

7 Corrective actions as needed, by date:

Ants nesting inside well & under cap. Killed as many as possible, but was not able to get all. Ants possibly getting under cap through vent hole in PVC riser.

d Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing			
a Is the protective casing free from apparent damage and able to be secured?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as ballers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7 Corrective actions as needed, by date:

 Date, field conditions 9/28/20

	yes	no	n/a
1 Location/identification			
a Is the well visible and accessible?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well properly identified with the correct well ID?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well in a high traffic area and does the well require protection from traffic?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
2 Protective Casing			
a Is the protective casing free from apparent damage and able to be secured?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of degradation or deterioration?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Does the casing have a functioning weep hole?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the annular space between casings clear of debris and water, or filled with pea gravel/sand?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the well locked and is the lock in good condition?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3 Surface pad			
a Is the well pad in good condition (not cracked or broken)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the well pad sloped away from the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well pad in complete contact with the protective casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the well pad in complete contact with the ground surface and stable? (not undermined by erosion, animal burrows, and does not move when stepped on)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the pad surface clean (not covered with sediment or debris)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4 Internal casing			
a Does the cap prevent entry of foreign material into the well?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b Is the casing free of kinks or bends, or any obstructions from foreign objects (such as bailers)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c Is the well properly vented for equilibration of air pressure?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d Is the survey point clearly marked on the inner casing?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e Is the depth of the well consistent with the original well log?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f Is the casing stable? (or does the pvc move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5 Sampling: Groundwater Wells Only:			
a Does well recharge adequately when purged?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater plan for the facility?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c Does the well require redevelopment (low flow, turbid)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6 Based on your professional judgement, is the well construction / location appropriate to 1) achieve the objectives of the Groundwater Monitoring Program and 2) comply with the applicable regulatory requirements?			
	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

1. INTRODUCTION

1.1 Purpose

This document presents an alternate source demonstration (ASD) for the statistically significant level (SSL) of arsenic (As) above the state and federal groundwater protection standard (GWPS) detected in delineation well BGWC-34D located at the Georgia Power Company (Georgia Power) Plant Bowen (Site) Ash Pond 1 (AP-1). Based on review of available data, the As detected in BGWC-34D is not associated with a release from AP-1 but is from a naturally-occurring source within the rock formation. The SSL was identified based on statistical analysis of the groundwater quality data for samples obtained during assessment monitoring activities conducted in 2020. This ASD has been prepared pursuant to regulations in Title 40 Code of Federal Regulations (CFR) Part 257 Subpart D [the Federal Coal Combustion Residuals (CCR) Rule], specifically § 257.95(g)(3)(ii), which allows the owner or operator to “demonstrate that a source other than the CCR unit caused the contamination, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.” Moreover, this ASD also serves as an ASD under the Georgia regulations per Rule 391-3-4-.10(6) of the Georgia Administrative Code, which incorporates § 257.95(g)(3)(ii) by reference.

1.2 Summary of Findings

Since January 2018, groundwater associated with AP-1 has been monitored under an assessment monitoring program pursuant to § 257.95. Cobalt (Co) and molybdenum (Mo) were identified at SSL concentrations in select compliance wells at AP-1. Well BGWC-34D was initially installed to vertically delineate SSLs of Mo in well BGWC-20. While Mo has been vertically delineated to below the GWPS in BGWC-34D, As was detected above the state and federal GWPS of 0.010 milligram per liter (mg/L) in that well.

Based on review of available Site data, the As detected in well BGWC-34D is not associated with a release from AP-1 but is instead caused by a natural source of As in the site-specific rock formation. This report provides the following information supporting this conclusion:

- The As detections above the GWPS in well BGWC-34D occur in a deeper flow zone that has a distinctly different geochemistry from the shallower groundwater that is not consistent with a potential release of As from AP-1; in fact, the geochemistry is more similar to background conditions than to other compliance wells. The shallower groundwater, as reported in compliance well BGWC-20, has higher concentrations of Appendix III constituents (including boron [B]), but no elevated As. The deeper flow zone in this area has much lower concentrations of Appendix III constituents, but higher As concentrations.
- Samples of rock cores from the Site contain As at concentrations up to an order of magnitude greater than average crustal abundance; samples collected from the core for BGWC-34D at the screened depth interval of BGWC-34D have the highest As concentrations [i.e., up to 13 milligrams per kilogram (mg/kg)] relative to the other rock core samples collected from depth intervals coinciding with the screened intervals of various compliance and delineation monitoring wells. Other rock samples had As detections between 0.8 mg/kg and 3.5 mg/kg. Elevated, naturally occurring As within North Georgia has been well documented in the literature and is most likely associated with As-bearing minerals such as pyrite. Similarly, the occurrence of As in well BGWC-34D is related to its natural occurrence and distribution in the subsurface geologic media.

1.3 Site Setting and Operational History

1.3.1 Site Description

Plant Bowen is a four-unit, coal-fired, electric-generating facility located nine miles southwest of Cartersville in Bartow County, Georgia. The plant is bordered by the Etowah River to the north and east, and sparsely populated, forested, rural, and industrial land on the south and west (**Figure 1**). Plant Bowen commenced operations in the 1970s.

Operation of AP-1 commenced in 1971 with receipt of sluiced CCR material from Plant Bowen. Georgia Power is currently in the permitting process to close AP-1 by consolidating the excavated CCR material into a fully-contained engineered structure using advanced engineering methods. In preparation for AP-1 closure, the plant completed the conversion to dry ash handling in early 2019 and AP-1 no longer receives ash. Georgia Power submitted to EPD a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020.

1.3.2 Site Geology and Hydrogeology

The Site is located in the Valley and Ridge Physiographic Province of northwest Georgia, which is characterized by Paleozoic sedimentary rocks that have been folded and faulted into the ridges and valleys that gave this region its name. The floor of the valley is underlain by shales, dolomites, and limestones of Cambrian and Ordovician age. Geologic mapping performed by Lawton et al. (1976) indicates that the Site is underlain by the Ordovician-Cambrian age Knox Dolomite and the Ordovician age Newala Limestone. Based on review of subsurface investigations at the Site, the bedrock is described as predominantly dolomite. The Site is underlain primarily by three lithologic units: (i) fill material consisting of earthen embankments and CCR material, (ii) residuum, and (iii) competent dolomite/limestone bedrock.

The residuum at the Site is the result of in-place weathering of the underlying dolomite/limestone bedrock. The residuum consists mainly of mottled light brown to red to yellow, low to high plasticity, stiff to very stiff clay, silt, and silty clay. Most soils contain varying amounts of black chert nodules and chert gravel. The bedrock at the Site is described as light to dark gray, fine to medium-grained, thinly-bedded to massive, dense, and hard dolomite, limestone, and dolomitic limestone. Some evidence of weathering along fracture or bedding surfaces was observed, with some manganese or iron oxide staining. Abundant calcite veins and occasional zones of healed dolomite breccia were observed throughout the bedrock. Solution features in the underlying limestone/dolomite bedrock formed over geological timeframes along pre-existing discontinuities such as joints and bedding planes. At the Site, these solution features are typically filled with sediment from the in-place weathering of the bedrock or the downward migration of the overlying residuum, but they may also be fully or partially open, or water filled.

The uppermost aquifer at the Site is a regional groundwater aquifer that occurs in the residuum and fractured and solutioned bedrock. Groundwater flow in bedrock is under unconfined to semi-confined conditions from the mantle of overlying lower-permeability residuum and is controlled by secondary porosity along fractures and solution-enhanced features.

1.4 Groundwater Monitoring and Statistical Analysis

A groundwater monitoring system was installed at AP-1 in accordance with § 257.91 and certified by a professional engineer (PE) on October 10, 2017. The compliance monitoring well network for AP-1 consists of a total of 22 compliance monitoring wells: five upgradient wells and 17 downgradient wells. The locations of the wells for the compliance monitoring well network are shown on **Figure 2**.

Georgia Power initiated an assessment monitoring program in January 2018 after identifying statistically significant increases (SSIs) of Appendix III parameters in groundwater. Statistical analyses of the assessment monitoring groundwater data collected in 2018 identified SSLs of Mo and Co at concentrations exceeding the state or federal GWPS in the following compliance monitoring wells: Mo (BGWC-20, BGWC-22, BGWC-23, and BGWC-30); and Co (BGWC-22). In response to identifying the SSLs listed above, Georgia Power has installed 18 additional monitoring wells and piezometers since initiating the assessment monitoring program to horizontally and vertically characterize the groundwater quality and flow upgradient and downgradient of AP-1. Well BGWC-34D was installed to vertically delineate Mo detected at well BGWC-20. It was located within 20 feet adjacent to BGWC-20. The mid-point of well screen BGWC-34D was installed approximately 30 feet deeper than the screen mid-point of compliance well BGWC-20. The locations of these wells are also presented on **Figure 2**. Well construction details are provided in **Table 1**. Boring and well construction logs for wells BGWC-20 and BGWC-34D are presented in **Appendix A**.

Statistical analysis of the March 2020 assessment monitoring groundwater data identified an SSL of As in BGWC-34D in excess of the state and federal GWPS. Prior to March 2020, constructing confidence intervals required for the statistical analysis could not be accomplished due to a limited data set. Details of the analysis and supporting data are presented in the *2020 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2021).

2. ALTERNATE SOURCE DEMONSTRATION

Based on review of Site information, the SSL of As identified in well BGWC-34D is not associated with a release from AP-1 but is instead caused by a natural source of As in the site-specific rock formation. This report provides the following information supporting this conclusion.

2.1 Different Geochemistry in Well BGWC-34D

Vertical delineation well BGWC-34D has intercepted a flow zone in this area which exhibits a geochemistry that is different from the shallow compliance well BGWC-20. This geochemical difference is demonstrated by molar ionic ratios summarized in **Table 2**. These ratios were calculated on a molar basis (mmol) for results from sampling events conducted in October 2018 and April 2019. The table summarizes results from background wells BGWA-2 and BGWA-29 together with monitoring well pairs that have a shallow and deep well nested together [BGWC-20/BGWC-34D (highlighted yellow); BGWC-22/BGWC-35D; BGWC-30/BGWC-36D]. As can be seen, ionic ratios for the conservative ions B, chloride (Cl) and sulfate (SO₄) as well as ion ratios involving As indicate that the geochemistry of samples from BGWC-34D is different from the geochemistry of the shallow well BGWC-20, while the other well pairs show a similar geochemistry between the shallow and the deep wells. This is especially evident when comparing the ion ratios involving As. Furthermore, the ion ratios from BGWC-34D are more similar to background conditions of BGWA-2 and BGWA-29 than to conditions in other wells. This indicates a background-like signature in BGWC-34D and a source of As that is not related to a release from AP-1.

2.2 Arsenic in Rock Cores

Samples of rock cores were collected from depth intervals that coincided with the screened intervals of various monitoring wells and submitted for laboratory analysis of As. **Table 3** summarizes the results together with corresponding groundwater concentrations from these wells, and **Appendix B** provides the laboratory analytical reports of the rock samples. Laboratory reports for the groundwater samples have been submitted under separate groundwater monitoring reports (Geosyntec, 2019a, 2019b).

The As concentrations in the two rock core samples from the screened interval of BGWC-34D had the highest concentrations of As of the nine locations sampled. The

concentration of As at BGWC-34D of up to 13 mg/kg is significantly higher than all other sampled locations which had As detections between 0.8 mg/kg and 3.5 mg/kg. The As concentration at BGWC-34D is also an order of magnitude higher than the average crustal abundance of 2 mg/kg (Cocker, 1996). These results indicate a natural source of As in the site-specific lithology with higher concentrations at this particular location. The higher rock core concentrations coincide with higher groundwater concentrations at BGWC-34D. While the specific source and/or form of this naturally occurring As has not been determined, the presence of As-containing pyritic minerals has been documented in North Georgia.

For example, in a study conducted by the Georgia Geologic Survey (Cocker, 1996), 38 samples of rock, soil and saprolite from North Georgia were analyzed for As. Eighty percent of these samples contained As in excess of 100 mg/kg. While the sources of As were not further evaluated in that study, both agricultural sources as well as As-bearing pyrite minerals were suspected as likely sources for this elevated As. In a later study conducted by Schroeder (2010), elevated As concentrations in excess of 100 mg/kg were detected in saprolite and bedrock samples collected from the Brevard Zone of North Georgia. The study concluded that the As was naturally occurring in pyrite and arsenopyrite minerals associated with the hydrothermal fluid migration along the geologic fault zone.

Small grains of pyrite can also occur in limestones and dolomites, and/or other iron minerals could serve to “concentrate” As through sorption of naturally occurring As from groundwater (Lazareva and Pichler, 2007). Iron staining in the rock cores indicate fluid flow along fractures and potential formation of iron-oxides/hydroxides that could host As liberated from the pyritic minerals. Quantitative mineralogical data are not available for this demonstration. Field evidence of pyrites in the rock matrix and iron hydroxides along fractures together with rock chemistry and groundwater ionic ratio data, strongly supports a natural occurrence of As in the rock matrix and a natural occurrence of As in groundwater in well BGWC-34D.

3. CONCLUSIONS

Monitoring well BGWC-34D was installed to vertically delineate SSLs of Mo in compliance well BGWC-20. While BGWC-34D does vertically delineates the Mo in BGWC-20 to below the respective GWPS, statistical analysis of the March 2020 assessment monitoring data identified an SSL of As in BGWC-34D in excess of the state and federal GWPS. This ASD documents that As is derived from a natural source and is not the result of a release from AP-1. The following lines of evidence are presented:

- Geochemical Fingerprint:
 - Groundwater samples from monitoring well BGWC-34D exhibit a geochemical fingerprint that is different from shallow well BGWC-20; an analysis using ion ratios indicates BGWC-34D has a distinctly different geochemistry that is not consistent with a potential release of As from AP-1; in fact, the geochemistry is more similar to background conditions than to other compliance wells.
- Naturally Occurring As in Rock Cores:
 - Rock samples from well location BGWC-34D show significantly higher As concentrations than other rock samples at the Site. The occurrence of As in the rock matrix at well location BGWC-34D, which is screened 30 feet deeper (i.e., between mid-point of screens) than the compliance well BGWC-20 lacking As detections in groundwater, strongly supports a natural occurrence of As in well BGWC-34D. Natural occurrence of As in regional rocks and groundwater are well-documented in the literature. Field evidence also demonstrates the potential occurrence of pyrite, which may also be a source of As to groundwater.

Notes:

ft = feet

ft BTOC = feet below top of casing

(1) Coordinates in North American Datum (NAD) 1983, State Plane, Georgia-West, feet. Survey completed by GEL Solutions obtained June 10, 2020.

(2) Elevations referenced to the North American Vertical Datum of 1988 (NAVD88). Survey completed by GEL Solutions obtained June 10, 2020.

(3) Total well depth accounts for sump if data provided on well construction logs.

(4) Monitoring well BGWC-14 was abandoned in May 17, 2020 and replaced with BGWC-14A on May 4, 2020.

Notes:
< = Parameter was not detected above the indicated method detection limit (MDL). The indicated MDL was used for the molar ionic ratio calculations.
J = Parameter was estimated and detected between the MDL and the reporting limit.
J* = Parameter was qualified at the reported concentration for being also detected in the corresponding field, equipment, or method blanks.
mg/L = milligrams per liter
mmol = millimoles

Table 3

Summary of Arsenic Concentrations in Rock Cores and Groundwater
Plant Bowen AP-1, Bartow County, Georgia

Well ID	Groundwater As (mg/L)		Rock Formation As (mg/kg) ⁽¹⁾
	Oct-2018	Apr-2019	Feb-2019
BGWC-20	<0.00057	0.00027 J	2.6
BGWC-31	0.0034 J	0.0036 J	2.8

BGWC-30	0.00064 J	0.00024 J	1.6
BGWC-36D	0.00082 J	0.00039 J	1.1

Notes:

< = Parameter was not detected above the indicated method detection limit (MDL).

As = Arsenic

J = Parameter was estimated and detected between the MDL and the reporting limit.

mg/kg = milligrams per kilogram

mg/L = milligrams per liter

(1) Rock samples were collected from the screen interval depth of its corresponding well.

(2) Wells are grouped by the primary compliance monitoring well and supporting adjacent horizontal and vertical delineation wells.

LEGEND

- ⊕ Compliance Monitoring Well
- ⊕ Horizontal Delineation Monitoring Well
- ⊕ Vertical Delineation Monitoring Well
- ⊕ Piezometer
- ⊕ Abandoned Monitoring Well

Notes:
 1. All wells and piezometers presented are screened within the weathered fractured bedrock.
 2. Monitoring Well BGWC-14 was abandoned on May 17, 2020.
 3. Aerial photograph source: Google Earth Pro, November 2019.

APPENDIX A

Boring and Well Construction Logs for BGWC-20 and BGWC-34D

LOG OF EXPLORATORY BORING

PROJECT NAME	Plant Bowen Hydrogeological Investigation	BORING NUMBER	BGWC-20
LOCATION	Euharlee, Georgia	PAGE	1 of 3
DRILLED BY	Cascade Drilling, Inc.	GROUND SURFACE ELEVATION	672.29 ft. NAVD88
DRILL METHOD	Rotosonic - PS-150	TOTAL DEPTH	46.9 feet
LOGGED BY	Matt Wilson	DATE COMPLETED	10/09/15
SAMPLING METHOD	4-in. ID by 10-ft. core barrel (CB)	BOREHOLE DIAMETER	6-inches
COORDINATES	(NAD83 WZ) Northing: 1503367.73; Easting: 2064259.55		

SAMPLING METHOD	RECOVERY (FEET)	10% HCL SOLUTION ACID TEST RESULT	DEPTH IN FEET	WELL DETAILS	GAMMA LOG	LITHOLOGIC COLUMN	LITHOLOGIC DESCRIPTION	GRA %	SAND %	FINES %	
CB	7.7/6.5	E					<p>0 to 1.7 feet: ROAD BASE, GRAVEL (GW), gray, angular, dry, silty gravel. (FILL) @ 1.0 to 1.7 feet: silty gravel.</p> <p>1.7 to 4.0 feet: MIX OF CLAY, AND ROAD BASE GRAVEL (CH/GW), clay is yellowish red, firm, moist, high plasticity; gravel is gray, angular, dry. (FILL)</p> <p>4.0 to 17.0 feet: CLAY (CH), reddish light brown with light red mottling, high plasticity, damp, stiff. (RESIDUAL) @ 5.8 to 5.9 feet: white chert nodule. @ 8.2 feet: chert nodules (black) layer. @ 10.1 feet: 0.1-foot layer of black chert nodules. @ 11.4 to 11.5 feet: layer of rust colored granular material.</p>	100	0	0	
CB	8.2/10	E/N							50	0	50
CB	5.8/10	N							0	0	100
CB	5.8/10	E					<p>17.0 to 46.5 feet: LIMESTONE, dark gray, hard, dense, effervesces readily, unweathered, sharp contact at 17.0 feet, individual beds range from 0.05- to 0.2-feet thick, surface of beds have white powdery texture, breakage along bedding planes. (BEDROCK)</p>	NA	NA	NA	

REMARKS: Acid test: E = Effervesces readily; N = No effervescence; S = Effervesces when the surface is scratched; W = Weakly effervescent. NAVD88 = North American Vertical Datum of 1988. NAD83 WZ = North American Datum of 1983, West Zone.

LOG OF EXPLORATORY BORING

PROJECT NAME	Plant Bowen Hydrogeological Investigation	BORING NUMBER	BGWC-20
LOCATION	Euharlee, Georgia	PAGE	2 of 3
DRILLED BY	Cascade Drilling, Inc.	GROUND SURFACE ELEVATION	672.29 ft. NAVD88
DRILL METHOD	Rotosonic - PS-150	TOTAL DEPTH	46.9 feet
LOGGED BY	Matt Wilson	DATE COMPLETED	10/09/15
SAMPLING METHOD	4-in. ID by 10-ft. core barrel (CB)	BOREHOLE DIAMETER	6-inches
COORDINATES	(NAD83 WZ) Northing: 1503367.73; Easting: 2064259.55		

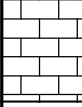

SAMPLING METHOD	RECOVERY (FEET)	10% HCL SOLUTION ACID TEST RESULT	DEPTH IN FEET	WELL DETAILS	GAMMA LOG	LITHOLOGIC COLUMN	LITHOLOGIC DESCRIPTION	GRA %	SAND %	FINES %
CB	6.9/10	E	25				<p>17.0 to 46.5 feet: LIMESTONE, continued.</p> <p>@ 16.5 to 26.5 feet: poor recovery, driller did not note any voids. Driller noted that the formation took the water he added during drilling.</p> <p>@ 17.7 to 18.4 feet: lenticular and linear calcite-filled veins.</p> <p>@ 22.4 to 23.1 feet: surface of beds have weathered orange to rust colored residue.</p>	NA	NA	NA
CB	6.3/10	E	30				<p>@ 31.3 to 33.2 feet: color change to light gray, some vertical calcite veins. Does not have powdery surface texture. Evidence of weathering on surfaces, rust red residue on outer surfaces.</p> <p>@ 33.2 to 34.0 feet: abundant calcite veins.</p>			
		E	35				<p>@ 36.5 to 38.4 feet: some rust-colored weathering staining on rock surfaces.</p>			
		E	40				<p>@ 39.0 to 39.7 feet: 0.7-foot-thick bed with horizontal and vertical calcite veins.</p>			

REMARKS: Acid test: E = Effervesces readily; N = No effervescence; S = Effervesces when the surface is scratched; W = Weakly effervescent. NAVD88 = North American Vertical Datum of 1988. NAD83 WZ = North American Datum of 1983, West Zone.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: Geosyntec Consultants, Inc.
Project/Site: Plant Bowen GW6581C

TestAmerica Job ID: 240-108844-1

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Case Narrative

TestAmerica Job ID: 240-108844-1

Job ID: 240-108844-1

Laboratory: TestAmerica Canton

Narrative

**Job Narrative
240-108844-1**

Comments

No additional comments.

Receipt

The samples were received on 3/2/2019 9:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 2.6° C and 3.0° C.

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Method Summary

1.0 INTRODUCTION

1.1 Purpose

This *Semiannual Remedy Selection and Design Progress Report* (the semiannual progress report) was prepared for Georgia Power Company (Georgia Power) Plant Bowen Ash Pond 1 (AP-1 or Site) in accordance with the United States Environmental Protection Agency (USEPA) coal combustion residual rule (CCR Rule) (40 Code of Federal Regulations [CFR] 257 Subpart D), specifically 40 CFR 257.97(a), and the Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management 391-3-4-.10(6)(a). This semiannual progress report describes the progress made during the second semiannual period of 2020 in selecting and designing a remedy previously documented in the *Assessment of Corrective Measures Report – Plant Bowen Ash Pond 1 (AP-1)* (Geosyntec, 2019a) (ACM Report).

The purpose of the ACM Report (and subsequent semiannual progress reports) is to document the process of selecting corrective measure(s) for groundwater. This process is typically iterative and may be composed of multiple steps to analyze the effectiveness of corrective measures to improve groundwater quality. Once potential corrective measures are identified, they are further evaluated using the criteria outlined in § 257.96(c) and Rule 391-3-4-.10(6)(a). Once selected based on these criteria, the corrective measure must meet the additional protection criteria outlined in § 257.97(b) and corresponding Rule 391-3-4-.10(6)(a). Additional details are provided within the ACM Report and the cited federal and state regulations. Pursuant to § 257.97(a) and Rule 391-3-4-.10(6)(a), semiannual progress reports have been regularly submitted to document the efforts of evaluating and progressing towards selecting a groundwater corrective measure (Geosyntec, 2019b, 2020a, 2020b).

As discussed in the ACM Report, the following corrective measures are potentially feasible for use at AP-1. A comparative screening of the corrective measures is provided in **Table 1**.

1. Geochemical Manipulation (In-Situ Injection)
2. Hydraulic Containment (Pump and Treat)
3. Monitored Natural Attenuation (MNA)
4. Permeable Reactive Barrier (PRB)
5. Phytoremediation
6. Subsurface Vertical Barrier Walls

However, the geochemical manipulation, PRB, and vertical barrier wall corrective measures have since been removed from consideration based on data evaluations presented in the previous semiannual progress report (Geosyntec, 2020b).

Georgia Power proactively initiated adaptive site management as outlined in the ACM Report (Geosyntec, 2019a) to support the groundwater remedy selection process and address potential changes in site conditions as appropriate during the ash pond closure. The adaptive site management approach will take existing site conditions, including natural attenuation mechanisms into account. Characterization activities to evaluate attenuation mechanisms at the Site include collection of data necessary to progressively evaluate the existing and long-term effectiveness of these processes in the aquifer and reduce uncertainty for decision making at each screening step as listed in the USEPA guidelines for MNA (USEPA, 2015) summarized below.

- * Tier I : Constituent concentrations & plume stability
- * Tier II: Constituent attenuation mechanisms
- * Tier III: Aquifer capacity and stability
- * Tier IV: Performance monitoring

In addition to the assessment monitoring program at the Site, Georgia Power conducted a human health and ecological risk evaluation to evaluate constituents that exhibit SSLs in groundwater (i.e., As, Co, and Mo) at AP-1. The risk evaluation used a conservative, health-protective approach that is consistent with USEPA risk assessment guidance, GA EPD regulations and guidance, and standard practice for risk assessment in the State of Georgia. As part of the risk evaluation, a well survey of potential groundwater wells within a three-mile radius of AP-1 was conducted and consisted of reviewing federal, state, and county records and online sources in addition to conducting a windshield survey of the area. The risk evaluation relied on groundwater data collected by Georgia Power from August 2016 to June 2020 in compliance with the federal and state CCR rules. Based upon this risk evaluation, which included multiple conservative assumptions, concentrations of As, Co, and Mo detected in groundwater at AP-1 are not expected to pose a risk to human health or the environment. The *Risk Evaluation Report – Georgia Power Company – Plant Bowen Ash Pond 1* (Geosyntec, 2021a) and associated well survey are provided as **Appendix A**.

1.2 Site Background and Overview of AP-1 Pond Closure

Plant Bowen is a four-unit, coal-fired, electric-generating facility that commenced operations in the 1970s. The plant is located nine miles southwest of Cartersville in Bartow County, Georgia. The plant is bordered by the Etowah River to the north and east, and sparsely populated, forested, rural, and industrial land on the south and west (**Figure 1**).

AP-1 at the Site occupies an area of approximately 254 acres. In preparation for AP-1 closure, the plant completed the conversion to dry ash handling in early 2019 and AP-1 no longer receives ash. Georgia Power submitted to GA EPD a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020. Georgia Power will close AP-1 by excavation and consolidation of CCR material into an approximately 144-acre lined, multi-cell storage facility situated within the current footprint of AP-1. Closure activities will be conducted in accordance with § 257.102 and corresponding Rule 391-3-4-.10(7)(b). The proposed closure approach reduces the potential for migration of CCR constituents to groundwater. Details of the closure approach have been summarized in the Amended Written Closure Plan and published in 2018 to Georgia Power's CCR compliance website.

1.3 Regulatory Program Status and Nature and Extent

CCR compliance groundwater monitoring-related activities have been performed for AP-1 since June 2016 pursuant to the CCR rule. Georgia Power initiated an assessment monitoring program in January 2018 after identifying statistically significant increases (SSIs) of Appendix III parameters in groundwater. Pursuant to § 257.95, samples were collected from the compliance monitoring well network, shown on **Figure 2**, and analyzed for Appendix IV constituents.

Statistical analyses of the 2018 assessment monitoring groundwater data identified statistically significant levels (SSLs) of molybdenum (Mo) and cobalt (Co) at concentrations exceeding the state or federal groundwater protection standards (GWPS) in the following compliance monitoring wells: Mo (BGWC-20, BGWC-22, BGWC-23, and BGWC-30); and Co (BGWC-22). Details of the analyses and supporting data are presented in the *2018 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2019c). Pursuant to § 257.96, Georgia Power initiated an ACM for AP-1 in January 2019. The ACM Report was subsequently prepared for AP-1 and submitted to GA EPD in June 2019 and posted to the CCR compliance website in July 2019.

Since the ACM was initiated, 17 additional monitoring wells and piezometers have been installed to horizontally and vertically characterize the groundwater quality and flow upgradient and downgradient of AP-1. The locations of the additional monitoring wells and piezometers are shown on **Figure 2**; **Table 2** provides well construction details. Supporting details and documents (e.g., boring logs, well construction table) have been previously submitted with the ACM Report or separate well installation reports.

Statistical analysis of the current 2020 assessment monitoring groundwater data identified the following bulleted list of SSLs of Appendix IV constituents at concentrations exceeding the noted state or federal GWPS. Details are provided in the *2020 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2021b).

AP-1 (Federal CCR Rule):

- Arsenic (As): BGWC-34D
- Co: BGWC-22;

AP-1 (GA EPD CCR Rule):

- As: BGWC-34D
- Co: BGWC-22;
- Mo: BGWC-22, BGWC-38D

Based on the groundwater data reported in the *2020 Annual Groundwater Monitoring and Corrective Action Report*, the SSLs of Co and Mo identified in BGWC-22 are horizontally and vertically delineated to below the state and federal GWPS by the statistically evaluated groundwater data for delineation wells BGWC-39 and BGWC-35D, respectively, and contained within the property boundary of Plant Bowen. The groundwater data from the September 2020 semiannual assessment monitoring event were used to generate the Co and Mo iso-concentration maps presented on **Figures 3** and **4**.

Analysis of the March 2020 groundwater data identified an SSL of As in BGWC-34D in excess of the state and federal GWPS. Prior to March 2020, constructing confidence intervals required for the statistical analysis could not be accomplished due to a limited data set. A demonstration document was prepared and submitted to GA EPD on July 30, 2019, presenting multiple lines of evidence that illustrate the groundwater As detections

are associated with naturally occurring As within the localized rock formation (Geosyntec, 2019d). Since As data were statistically evaluated and are now an SSL, an Alternate Source Demonstration (ASD) was prepared and included as Appendix C in the *2020 Annual Groundwater Monitoring and Corrective Action Report*.

An SSL of Mo was identified in BGWC-38D in excess of the state GWPS for the September data set. The Mo concentration is horizontally delineated to below the state GWPS by well BGWC-44D; vertical delineation is pending the installation of deeper delineation wells, scheduled to occur in the first quarter of 2021, as described in the certified delineation workplan submitted to GA EPD January 18, 2021 (Geosyntec, 2021c).

As shown on **Figure 3**, the most recent sampling event shows Co concentrations at BGWC-16 slightly above the GWPS for the Site; however, there is currently not an SSL reported for this location. Georgia Power will continue to sample this compliance well as part of the assessment monitoring program and update the statistical analysis.

At this time, concentrations of Appendix IV constituents above the state and federal GWPS are delineated to within the property boundary by delineation wells BGWA-6, BGWC-40, BGWC-39, BGWC-41D, and BGWC-44D. Pursuant to § 257.96, groundwater in the vicinity of AP-1 continues to be monitored during the ACM phase in accordance with the established assessment monitoring program.

2.0 SUMMARY OF WORK COMPLETED

The following summarizes the field investigations and data evaluations completed since the issuance of the prior semiannual progress report in August 2020 (Geosyntec, 2020b) in support of delineating Appendix IV SSLs and evaluation of the corrective measures presented in the ACM Report. The routine assessment monitoring event conducted in September 2020 is discussed in the *2020 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2021b). The analysis of groundwater and aquifer solids was designed to support a tiered evaluation of MNA and potential supporting remedies in accordance with USEPA guidelines (USEPA, 2015).

2.1 Supplemental Sampling for Geochemical Evaluation

Supplemental groundwater samples were collected from the entire AP-1 compliance and delineation well networks during the semiannual assessment monitoring event conducted in September 2020 and submitted under chain-of-custody protocol to Pace Analytical Services, LLC., in Norcross, Georgia. The additional samples were analyzed for major cations (calcium [Ca], magnesium [Mg], potassium [K], and sodium [Na]) and anions (chloride [Cl], sulfate [SO₄], and bicarbonate alkalinity [HCO₃]) as well as iron (Fe), manganese (Mn), and sulfide. The data were collected in support of the ongoing evaluation of the geochemical composition of the groundwater.

2.2 Data Analysis of Unconsolidated (Soil/Weathered Bedrock) Aquifer Solids

As previously described in more detail in the August 2020 semiannual progress report (Geosyntec, 2020b), aquifer matrix samples were collected from the saturated unconsolidated zone at five locations in the vicinity of AP-1. The sample depths were selected based on review of available boring logs from monitoring wells in the vicinity of the DPT boreholes to target the residuum and/or highly weathered rock zones. The sample depths generally correspond with the screen interval depths of the compliance monitoring wells reporting impacted groundwater. The approximate locations of the boreholes are illustrated on **Figure 2**. Associated field logs recorded during sample collection are provided in **Appendix B**.

The aquifer matrix samples were sent to SiREM analytical laboratory (Guelph, Ontario) to evaluate attenuation mechanisms, rates and capacity, as well as the mineralogical characterization by application of the following analytical/testing methods.

- *Cation and Anion Exchange Capacity*: Separate tests that indicate relative adsorptive capacity for cationic and anionic metals/constituents. Understanding

the capacity of solids in the subsurface to retain positively and negatively charged solutes helps in the evaluation of attenuation mechanisms and capacity (USEPA Tiers II and III).

- *Total Sulfur, Sulfide*: Total amount of oxidized and reduced sulfur relevant to metals that are prone to coprecipitate with and/or form sulfide minerals. Understanding the presence and speciation of sulfur compounds allows an estimation of whether certain metals are likely to form sparingly soluble sulfide minerals as a possible attenuation mechanism (USEPA Tiers II and III).
- *Organic Carbon Content*: Presence of substrate for adsorption and energy source for microbially mediated metal(loid)s transformations. Organic carbon in the subsurface can serve to sorb/retain metals, but it can also provide food to microorganisms that use certain metal(loid)s as electron acceptors and therefore change their oxidation-reduction (redox) state, which affects their mobilization/immobilization (USEPA Tiers II and III).
- *Total Metals Concentration*: Total concentrations of targeted constituents in the solid phase. The samples were analyzed for Mo, Li, Co, As, Fe, Al, and Mn. This analysis helps to understand the presence of site-specific constituents in aquifer solids as well as the elements Fe, Al, and Mn that form major mineral phases known to sorb/retain many metals (USEPA Tiers II and III).
- *X-Ray Diffraction, Scanning Electron Microscopy (SEM) and Energy Dispersive X-Ray Analysis (EDXA)*: Qualitative and quantitative confirmation of mineral phases present, including Whole Rock Analysis (WRA) for quantitative confirmation of XRD results. Identifying crystalline and non-crystalline mineral phases aids in the evaluation of attenuation mechanisms and capacity (USEPA Tiers II and II).

Data obtained from these analyses are used to evaluate the viability of select corrective measures (i.e., MNA and, to a lesser degree, phytoremediation).

3.0 SUMMARY OF RESULTS

The following presents the results of work outlined in Section 2.

3.1 Summary of Unconsolidated Aquifer Solids Analysis

As indicated above, aquifer materials collected from one background location (i.e., DPT-05) and four downgradient locations (i.e., DPT-01 through DPT-04) were shipped to SiREM laboratories for the specialized analyses introduced in Section 2.2.2. A brief summary of the results is provided below, and the complete SiREM report is included in **Appendix C** of this report.

3.2.1 Anion and Cation Exchange Capacity

Ion exchange capacity (both AEC and CEC) of a soil or aquifer is an important variable to understand when evaluating attenuation processes. It is generally defined as the capacity of a soil to retain both positively charged and negatively charged ions, such as many metals, (micro-) nutrients, and anions such as sulfate or chloride. Note that while many metals are present as cations in soils under most environmental conditions (such as lead [Pb], zinc [Zn], Al, cadmium [Cd], Fe, etc.), a number of metals can also occur as oxyanions in nature, such as As, selenium [Se], or Mo. It is therefore important to account for both the CEC as well as the AEC of a soil to evaluate its capacity to retain these ions via sorptive processes.

The CEC of soils is dependent on the amount and type of clay minerals, organic matter, and amorphous minerals, while the sources of AEC in soils include clay minerals (primarily 1:1 clays such as kaolinite), metal oxides, and amorphous materials. In general, the CEC of a soil is higher than the AEC, but highly weathered and acidic soils can have substantial AEC (Sparks, 1995).

The table presented on page 4 of the SiREM report included in **Appendix C** lists the CEC ranging from 4.90 milliequivalents per 100 grams (meq/100 g) in boring (DPT-04) to 28.0 meq/100 g in boring DPT-02. These values are reflective of the clay minerals present. Similarly, the AEC ranges from 5.50 meq/100 g in DPT-01 to 8.13 meq/ 100 g in DPT-04. Interestingly, The AEC was almost equal to the CEC in boring DPT-01 and almost twice as high than the CEC in boring DPT-04. Given the low to non-detect total organic carbon content of these soils, the ion exchange capacities appear to be mostly dominated by clay minerals and metal oxides (likely both crystalline and amorphous – see discussion further below).

3.2.2 Total Sulfur, Total Sulfide, and Total Organic Carbon

The presence of sulfur, and especially sulfide in the aquifer materials may give an indication whether metals prone to precipitation as sulfides or co-precipitation with sulfidic minerals, such as Fe, As, copper [Cu], Zn, Cd and others might be present in the aquifer matrix. Organic carbon, if present, can contribute to the CEC of a soil and would therefore increase the sorptive capacity of a soil or aquifer matrix.

As can be seen in the table presented on page 4 of the SiREM report included in **Appendix C**, neither total sulfur nor total sulfide were detected at their respective detection limits of 0.005% and 0.04%, respectively, in any of the five borings. However, the lack of sulfide detections at this detection limit does not necessarily indicate that sulfidic minerals are not present in the aquifer matrix but that, as expected, they cannot be detected using this analytical approach.

The TOC content of these materials is low, ranging from non-detect (<0.025%) in background boring DPT-05 to 0.10% in DPT-02. These low results are not unexpected given that the samples were collected at depth within the aquifer matrix made up of residuum (i.e., clays) and partially weathered bedrock. Therefore, organic carbon is not expected to play a major role in the attenuation of site-specific constituents.

3.2.3 Total Metals and Whole Rock Analyses

The total metals results are summarized in the table presented on page 5 of the SiREM report included in **Appendix C**. The metals include the site-specific constituents of interest Mo, Li, Co, and As. In addition, Fe, Al, and Mn were also analyzed to give an indication whether oxides/oxyhydroxides of these metals may be present, since these mineral phases can be a significant source of attenuation capacity for metal(loid)s.

As can be seen in this table, the aquifer materials contain appreciable concentrations of site-specific constituents of interest. Molybdenum detections ranged from 2.2 microgram per gram ($\mu\text{g/g}$), which is equivalent to milligram per kilogram (mg/kg), in background boring DPT-05 to 8.8 mg/kg in downgradient boring DPT-01. This variation indicates that weathering processes across the Site provide a variable supply of naturally occurring Mo and/or that the aquifer matrix has attenuated these constituents along the groundwater flow-path. On average, carbonates contain only about 0.4 mg/kg of Mo (AGI, 2016), and the site-specific results are approximately an order of magnitude higher. This could explain why some locations may have slightly higher Mo groundwater concentrations than others. For example, the background boring DPT-05 contained 2.2 mg/kg of Mo in the aquifer matrix, while downgradient boring DPT-02 near well BGWC-22 (which

reported a Mo SSL) contained more than three times as much Mo at a concentration of 7.6 mg/kg within the aquifer matrix. As stated above, this could either be due to naturally elevated Mo in the formation, or due to attenuation of Mo within the aquifer matrix along the groundwater flow-path.

Site-specific concentrations of Li in unconsolidated aquifer solids are also approximately an order of magnitude higher than literature-reported average concentrations of this element in carbonates (i.e., 5 mg/kg; AGI, 2016), and range from 23 mg/kg in boring DPT-01 to 69 mg/kg in boring DPT-04. This clearly indicates a substantial natural source of Li in the aquifer matrix. Similarly, Co concentrations are approximately two orders of magnitude higher than literature-reported average concentrations of this element in carbonates (i.e., 0.1 mg/kg; AGI, 2016), and range from 12 mg/kg in background boring DPT-02 to 29 mg/kg in boring DPT-04. The presence of these naturally occurring sources of Co coupled with slight changes in geochemical conditions in groundwater (such as slightly lower pH values) may explain variable Co levels in groundwater.

Arsenic concentrations are also substantial in these borings and range from 6.8 mg/kg in DPT-01 to 30 mg/kg in DPT-02. Again, these concentrations are approximately an order of magnitude higher than the average As content of carbonates (i.e., 1 mg/kg; AGI, 2016), and these naturally occurring sources can contribute to As in groundwater under the right geochemical circumstances (e.g., reducing conditions).

As expected for residuum and highly weathered bedrock materials, the Fe and Al contents are substantial, with Fe concentrations ranging from 17,000 mg/kg (1.7%) in background borings DPT-01 and DPT-02 to 40,000 mg/kg (4.0%) in DPT-02 and DPT-05, and Al concentrations ranging from 39,000 mg/kg (3.9%) in DPT-01 to 93,000 mg/kg (9.3%) in DPT-04 (see table on page 5 in **Appendix C**). This is also approximately one order of magnitude higher than the average Fe and Al contents of carbonates (i.e., 0.38% and 0.42%, respectively; AGI, 2016), which is indicative of the abundant presence of Fe- and Al-oxides and hydroxides as well as clay minerals formed through weathering and soil formation, which provide substantial attenuation capacity for site-specific constituents reporting SSLs. Manganese concentrations range from 210 mg/kg in boring DPT-03 to 960 mg/kg in boring DPT-01 and are moderately lower than average Mn concentrations for carbonates (i.e., 1,100 mg/kg; AGI, 2016).

Whole Rock Analysis (WRA) was included as a chemical assay to confirm and reconcile the quantitative mineral analysis obtained through XRD. While the name might imply “rock” samples, the analysis was conducted on the unconsolidated DPT borings and not competent bedrock. The WRA of these aquifer materials summarized in the table

presented on page 6 of the SiREM report (**Appendix C**) confirm the presence of major mineral phases. Quartz was the most abundant mineral phase detected in these borings ranging from 64.6% to 82.4%, with Al-oxide and Fe-oxide concentrations coming in as the second most abundant mineral phases ranging from 7.32% to 17.3%, and 3.59% to 5.69%, respectively. Other mineral phases are also present, albeit at lower concentrations.

3.2.4 XRD and SEM/EDXA Analyses

XRD as well as SEM/EDXA analyses were completed to characterize both the crystalline and non-crystalline mineralogy/phases of the unconsolidated aquifer matrix. Overall, the mineralogy of the aquifer matrix reflects the abundance of quartz, muscovite, kaolinite, and goethite, and includes minerals that provide ample surface area and ion exchange capacities to attenuate both cationic as well as anionic constituents.

As expected (and confirmed through WRA), the quantitative XRD analysis (see page 7 in **Appendix C**) indicated that the largest percentage of the aquifer matrix is made up of quartz, ranging from 39.9% (by weight) in boring DPT-03 to 79.2% (by weight) in boring DPT-01. The second-highest percentage of the mineralogy was characterized by the 2:1 clay mineral muscovite and the 1:1 clay mineral kaolinite. Muscovite ranged from 11.1% in boring DPT-01 to 21.6% in background boring DPT-05, while kaolinite ranged from 6.6% (by weight) in boring DPT-01 to 24.5% (by weight) in boring DPT-03. Muscovite provides substantial surface area for sorption and its significant presence is likely a major reason that the CEC of these soils is higher than would be expected from just the presence of kaolinite, which was detected between 6.6% in DPT-01 and 24.5% in DPT-03.

Another important mineral includes goethite (α -FeOOH), which was detected in three of the five borings between 10.4% and 17.5% but was not detected in borings DPT-01 and DPT-05. Other consistently detected minerals include the feldspar minerals albite and orthoclase, and occasional detections include the feldspar mineral microcline (one of five borings), the iron oxide mineral magnetite (two of five borings), and the titanium oxide (TiO₂) mineral rutile (three of five borings).

The SEM/EDXA images and results are included as pages 24 through 65 in the SiREM report (**Appendix C**). SEM/EDXA has the advantage of also identifying amorphous (i.e., non-crystalline) phases that cannot be identified using XRD. It therefore supplements the XRD results.

The identified minerals and amorphous phases were generally consistent across all five borings. The main minerals identified include quartz, various feldspar minerals and silicates (including mica, amphibole, zircon), titanium-containing minerals such as rutile and ilmenite, and an abundance of non-crystalline Fe- and Mn- oxides that are either present within the soil matrix or as coatings on quartz and feldspar grains. Interestingly, pyrite was identified in one boring (i.e., DPT-04), demonstrating that sulfide minerals can still be present even through total sulfide was non-detect within the aquifer matrix. The abundance of Fe- and Mn-oxides suggests that ample sorption sites are potentially available within the aquifer matrix to attenuate site-specific constituents.

4.0 UPDATED CONCEPTUAL SITE MODEL

AP-1 will be closed by excavation and consolidation of CCR material into an approximately 144-acre lined, multi-cell storage facility situated within the current footprint of AP-1, thereby providing a source control measure that reduces potential for migration of CCR-related constituents to groundwater. The conceptual site model (CSM) indicates that, even under current conditions, the groundwater exceedances are horizontally and vertically delineated onsite, and that some of the exceedances are due to (a) source(s) other than AP-1. The additional data collected since the issuance of the previous semiannual progress report in August 2020 (Geosyntec, 2020b) allow the refinement of the CSM. A detailed summary of field efforts and data analysis to be completed to refine the CSM in support of delineating Mo concentrations in groundwater at the Site is presented in the *Delineation Workplan*. The following bullets summarize the current understanding of the CSM within the context of selecting an appropriate groundwater corrective measure for AP-1.

- As presented during the previous semiannual progress report as well as the *Delineation Workplan*, groundwater delineation data confirm that well BGWA-33 is an upgradient well, which has been included into the upgradient/background monitoring network.
- Recent iso-concentration maps show that Mo and Co SSLs are horizontally and vertically delineated onsite to below the state GWPS. Molybdenum levels noted in BGWC-38D and BGWC-43D will be addressed as outlined in the *Delineation Workplan*. Furthermore, recent Co results in BGWC-16 are slightly above the site-specific background, but do currently not constitute an SSL.
- The characterization of unconsolidated aquifer solids summarized in this semiannual progress report included determination of the CEC and AEC, evaluation of total sulfur, total sulfide, and TOC concentrations, evaluation of total metals and whole rock analysis, and characterization of the soil/aquifer mineralogy using XRD as well as SEM/EDXA methods. This characterization was completed to evaluate attenuation mechanisms consistent with the tiered approach of USEPA's guidance for the implementation of MNA (i.e., Tiers II and III). Results indicate CEC and AEC levels consistent with the primary and secondary soil minerals present, including the type and abundance of various clay minerals. Furthermore, metals detected within the aquifer matrix may contribute to groundwater conditions observed in various locations across the Site. The abundant presence of identified crystalline and non-crystalline mineral phases,

including mineral coatings of Fe- and Mn-oxides, suggest that the aquifer matrix has sorption capacity to attenuate the site-specific constituents of interest.

- Molybdenum is present in the aquifer media at concentrations higher than the crustal abundance and average concentrations in carbonate rocks. Similarly, Co and As occur at higher than average literature-reported concentrations of these constituents in carbonates. Therefore, these sources of As, Co, and Mo in the aquifer matrix could mobilize these constituents to groundwater at the Site.
- An ASD for the As SSL at well BGWC-34D has been prepared that indicates that the As concentrations above the GWPS detected within this well are not due to a release from AP-1, but are likely due to As levels found within the rock matrix analyzed at this location.
- Groundwater conditions and/or statistical results continue to change, leading to the reduction of groundwater concentrations to below applicable state GWPS in select compliance monitoring and delineation wells (e.g., Mo in BGWC-30, BGWC-36D, and BGWC-37D reduced to below the previous state GWPS of 0.010 mg/L during the reporting period).

5.0 UPDATED EVALUATION OF CORRECTIVE MEASURES

As discussed during the last progress report, three of the six potential corrective measures were previously eliminated for further evaluation to treat the site-specific constituents in groundwater. These included geochemical manipulations/injections, a permeable reactive barrier (PRB), and a vertical barrier wall. The other three potential corrective measures were retained for further evaluation. Data collected during the past six months reported in the current progress report have not resulted in the elimination of additional corrective measures. Therefore, the following three potential corrective measures, which have been described in further detail in the previous progress report, will be retained for further evaluation:

- Hydraulic Containment:
 - This approach is not considered for implementation in the immediate vicinity of AP-1 due to geotechnical considerations in the context of the site-specific geology. However, it could be used along Euharlee Creek should the closure construction activities require such a groundwater treatment configuration as an interim measure and/or contingency approach.
- Monitored Natural Attenuation:
 - The characterization of aquifer solids presented in this current progress report suggests that the aquifer matrix has substantial attenuation capacity for the various constituents of interest at the Site. Therefore, MNA remains a viable corrective measure, especially coupled with the closure of AP-1 through excavation and consolidation into a lined, multi-cell storage facility situated within the current footprint of AP-1. MNA may either be a stand-alone corrective measure or be part of a combination of corrective measures to address groundwater impacts.
- Phytoremediation:
 - The use of an engineered (proprietary) TreeWell® phytoremediation system remains a viable corrective measure at certain locations of the Site. This potential corrective measure may be feasible through targeted placement of TreeWell® units downgradient of AP-1 to promote the uptake of impacted groundwater at the Site and provide hydraulic

containment without the need to treat extracted groundwater. It is recognized that phytoremediation of groundwater in deeper zones around well BGWC-43D (>150 ft below ground surface) is not feasible, but similar to the hydraulic containment approach outlined above, it could be used along Euharlee Creek should the closure construction activities require such a groundwater treatment/containment configuration.

Given that groundwater conditions and/or statistical results continue to change and are likely to also be affected by closure and construction activities at AP-1, an adaptive site management approach will be used to address groundwater conditions as a consequence of closure activities. Continued groundwater monitoring and updates to the statistical analyses will further refine the CSM and allow for the continued evaluation of an appropriate groundwater corrective measure at the Site. This may include additional tests using the unconsolidated aquifer materials to further demonstrate the viability of MNA according to USEPA's tiered approach for the use of MNA in groundwater.

6.0 PLANNED ACTIVITIES & ANTICIPATED SCHEDULE

The proposed closure by removal approach provides a source control measure that reduces the potential for migration of CCR constituents to groundwater. During the pond closure by excavation and consolidation of CCR, temporary changes in site conditions may occur that must be considered as part of remedy selection. Georgia Power proactively initiated adaptive site management as outlined in the ACM Report (Geosyntec, 2019b) to support the remedial strategy and address potential changes in site conditions as appropriate. The adaptive site management approach may be adjusted over the Site's life cycle as new site information and technologies become available. To this end, Georgia Power will continue its data collection efforts as necessary in support of efforts to refine the CSM and to further evaluate the feasibility of the corrective measures retained for further evaluation. Once sufficient data are available to make technically sound decisions regarding the ability to implement one or more specific corrective measures, necessary steps will be taken to design and implement a remedy for AP-1 in accordance with § 257.98.

Supplementary data collection and evaluation activities proposed to be completed during the next semiannual reporting period are presented in the *Delineation Workplan* (Geosyntec, 2020c) and in **Table 3**.

- *Characterize groundwater flow in deeper bedrock by installation of deep delineation wells in bedrock and evaluation of groundwater/aquifer data as further described in the Delineation Workplan.*
- *Conduct a series of specialized analyses (e.g., column studies) on unconsolidated aquifer solids to further evaluate the attenuation capacity of constituents of interest and attenuation rates in support of evaluating MNA consistent with USEPA's four-tier approach.*
- *Evaluate potential adaptive triggers that may be incorporated into a long-term adaptive management strategy in response to changing groundwater conditions during and after pond closure.*
- *Evaluate conceptual layouts of phytoremediation and hydraulic containment corrective measures to evaluate hydraulic capture zones under anticipated closure conditions.*

Georgia Power will continue to prepare semiannual progress reports to document AP-1 groundwater conditions, results associated with additional data collection, and the progress in selecting and designing a groundwater remedy in accordance with § 257.97(a). Georgia Power will include future semiannual progress reports in routine groundwater monitoring and corrective action reports. Record keeping, notifications, and publicly accessible internet site requirements for the semiannual progress reports will be provided in accordance with § 257.105(h)(12), § 257.106(h)(9), and § 257.107(h)(9), respectively.

TABLES

Table 1
 Evaluation of Remedial Technologies
 Plant Bowen AP-1, Bartow County, Georgia

Corrective Measure	Regulatory Citation for Criteria:		40 CFR 257.96(C)(1)	
	Description	Performance	Reliability	Ease of Implementation
Geochemical Approaches (In-Situ Injection)	Use of an injection well network, or other means of introducing reagents or air into the subsurface, to provide suitable reagents for either anaerobic or aerobic attenuation of Co and Mo. Under anaerobic conditions, Co would be attenuated within sparingly soluble sulfide minerals; this approach might also increase the attenuation of Mo. Under aerobic conditions, soluble iron or manganese and oxygen (either via air sparging or through a chemical oxidant) would be injected to promote the formation of iron or manganese (oxy-) hydroxides for subsequent sorption of Co (and potentially, Mo) onto these mineral phases. If sufficient iron is present in groundwater, the use of air sparging alone may be considered to precipitate iron (oxy-) hydroxides for sorption. In-situ chemical oxidation (ISCO) or in-situ chemical reduction (ISCR) can be used to chemically alter the redox environment in the subsurface to affect the mobility of certain inorganic compounds, including Co. However, the main attenuation mechanism for Co and Mo is sorption, which is more dependent on pH than redox.	The effective immobilization of Co has been shown under aerobic and anaerobic conditions; however, the anaerobic approach (involving the injection of an electron donor together with iron or manganese and sulfur) requires careful study and testing. While aerobic approaches are somewhat less complex, additional aquifer characterization is needed to further evaluate these options. It is currently not well understood whether molybdenum can be efficiently attenuated using in-situ redox manipulations due to slow reaction kinetics. Mo attenuation under both aerobic and anaerobic conditions needs to be further evaluated but is expected to occur. Mo is more strongly sorbed to aluminum oxides than other metal oxides, and it is generally less sorptive and more mobile compared to Co.	Reliability dependent on permeability of the subsurface and the amount and distribution of secondary iron or manganese (oxy-) hydroxides (for aerobic approach), or electron donors and soluble iron or manganese and sulfur that can be consistently distributed (for anaerobic approach). Reliable technology if injected materials can be distributed throughout the impacted aquifer. Bench- and/or pilot-scale treatability testing programs are needed to understand the biogeochemical processes that would effectively reduce migration of Co and Mo in groundwater.	Moderate. Installation of injection well network or other injection infrastructure would be required. Alternative installation approaches may be considered, such as along the downgradient edge of impacted groundwater, which would function similar to a PRB application. Potential for clogging of aquifer matrix and/or injection well infrastructure. Chemical distribution during injections could be challenging or ineffective due to the highly anisotropic aquifer conditions and the resulting uncertainty that injection reagents would be distributed within the required treatment zones. A fairly wide range of hydraulic conductivities encountered at the site depending on the degree of weathering, fractures and secondary dissolution of these units. Impractical to conduct injections at the required depths to treat the aquifer zone in the vicinity of BGWC-43D (>150 ft below ground surface)
Hydraulic Containment ("Pump and Treat")	Hydraulic containment refers to the use of groundwater extraction to induce a hydraulic gradient for hydraulic capture or control the migration of impacted groundwater. This approach uses extraction wells or trenches to capture groundwater, which may subsequently require above-ground treatment and permitted discharge to a receiving water feature, reinjection into the groundwater, or reuse (e.g., land application, CCR conditioning, etc.). It is applicable to a variable mix of inorganic constituents, including dissolved Co and Mo.	Hydraulic containment is effective, but it is unclear whether full groundwater remediation can be achieved without further understanding attenuation mechanisms at the Site. At AP-1, implementation of the corrective measure is contingent on completing additional assessment activities (i.e. high-resolution site characterization, additional pump tests, flow modeling, and capture zone analysis). This is needed to refine the constituent distribution in the subsurface to target specific zones for pumping for improved mass recovery efficiency/ effectiveness and to further evaluate the potential remedy performance.	Generally reliable for hydraulic containment, but uncertainty exists whether groundwater remediation goals can be achieved within a reasonable time frame without further understanding attenuation mechanisms.	Moderate. Proven approach, and supplemental installation of extraction wells/trenches is fairly straightforward. The extracted groundwater may potentially require an above-ground treatment system. A variety of sorption and precipitation approaches exist for ex-situ treatment of Co and Mo. Operation and maintenance (O&M) requirements are expected to include upkeep of infrastructure components (pumps, pipes, tanks, instrumentation and controls, above-ground treatment system) and handling of treatment residuals.
Monitored Natural Attenuation (MNA)	MNA relies on natural attenuation processes to achieve site-specific remediation objectives within a reasonable time frame relative to more active methods. Under certain conditions (e.g., through sorption, mineral precipitation or oxidation-reduction reactions), MNA effectively reduces the dissolved concentrations of inorganic constituents in groundwater. Attenuation mechanisms for inorganic constituents at CCR sites, including cobalt (Co) and molybdenum (Mo) at AP-1, are either physical (e.g. dilution, dispersion, flushing, and related processes) or chemical (e.g., sorption or oxidation reduction reactions). Chemical attenuation processes include precipitation and sorption reactions such as adsorption on the surfaces of soil minerals, absorption into the matrix of soil minerals, or partitioning into organic matter. Further, oxidation-reduction (redox) reactions, via abiotic or biotic processes, can transform the valence states of some inorganic constituents to less soluble and thus less mobile forms. For Co and Mo, the main attenuation processes include sorption to iron and manganese oxides (Co and Mo), aluminum oxides (Mo), and formation of sparingly soluble sulfide minerals (Co).	Physical and chemical MNA mechanisms for Co and Mo, including dilution, dispersion, sorption, and oxidation reduction reactions can be effective at achieving groundwater protection standards (GWPS) within a reasonable time frame. Attenuation processes for Co and Mo are already occurring at the site as evidenced by data from the delineation wells. Source control will improve the mass balance such that the buffer capacity of the aquifer is unlikely to be exhausted, and the attenuation processes already at work for Co and Mo at AP-1 will further enhance ongoing MNA.	Reliable as long as the aquifer conditions that result in Co and Mo attenuation remain favorable and/or are being enhanced and sufficient attenuation capacity is present. MNA is reliable and can either be used as a stand-alone corrective measure for groundwater impacted by dissolved Co and/or Mo, or in combination with a second technology.	Reasonably implementable with respect to infrastructure, but moderate to complex with respect to documentation. Proven approach, but additional data are needed to complete the evaluation with respect to USEPA's 4-tiered approach to confirm the viability of MNA as an applied corrective measure. A monitoring well network already exists to implement future groundwater monitoring efforts.
Permeable Reactive Barrier	Permeable reactive barrier (PRB) technology typically involves the installation of a permeable subsurface wall constructed with reactive media for the removal of constituents as groundwater passes through. Either ZVI-Carbon matrix or solid carbon (bio-barrier) are currently proposed for the concurrent removal of Co and Mo. The carbon could be composed of peat moss, mulch or another carbon source. Exact placement of the PRB is determined by site-specific characterization. PRB walls are typically keyed into the bedrock. While the shallow groundwater in the residuum and fractured bedrock is connected to the groundwater in more competent bedrock, the higher permeability/conductivity of the PRB is not expected to impede groundwater flow. PRBs can also be constructed as "funnel and gate" systems, where a barrier wall directs groundwater to a smaller "treatment gate" filled with reactive media.	PRBs have been shown to effectively address Co and Mo in groundwater if the right mix of reactive materials (e.g., ZVI and carbon) is selected for concurrent removal/immobilization of these constituents. The approach is expected to achieve GWPS for both constituents as impacted groundwater passes through the reactive barrier. Molybdenum redox kinetics may be slow and hence a thicker wall might be needed relative to solely treating for Co. Furthermore, additional testing is required to select the appropriate sorptive media mix, especially related to Mo.	Reliable groundwater corrective measure, but loss of reactivity over time may require re-installation depending on the duration of the remedy. Additional data collection, including conducting a bench and/or pilot study, is needed to better characterize current attenuation mechanisms and/or select the appropriate reactive media mix for a PRB wall.	Difficult to infeasible. Trenching would be required to install a mix of reactive materials in the subsurface. Continuous trenching may be the most feasible construction method. Site-specific geology (i.e., partially weathered bedrock layer) poses a possible constructability challenge when attempting to key PRB material into competent bedrock. Installation methods and materials are readily available. Once installed, treatment will be passive and O&M requirements are minimal if replacement of the PRB is not necessary. Technically infeasible to construct a PRB at the required depths to address the aquifer zone in the vicinity of BGWC-43D (>150 ft below ground surface).
Phytoremediation / TreeWells	Phytoremediation uses trees and other plants to uptake or immobilize constituents or achieve hydraulic control without the need for an above-ground water treatment system and infrastructure. Within the context of AP-1, this corrective measure would likely use an engineered (proprietary) TreeWell® phytoremediation system along the point of compliance or downgradient edge of the impacted groundwater for hydraulic control. The system promotes root development to the targeted groundwater zone (depth), allowing for hydraulic control of impacted groundwater. In addition, immobilization of Co and Mo within the root zone as well as incidental uptake of dissolved Co and Mo with groundwater is expected to occur concurrent with hydraulic control.	Once established (typically at the end of the third growing season), a TreeWell system is effective for providing hydraulic containment of groundwater, and potential reduction of Co and Mo concentrations through immobilization and/or uptake and sequestration in the tree biomass; however, the main purpose is to provide hydraulic control. Given the site-specific hydrogeology and reported Co and Mo groundwater concentrations surrounding AP-1, the approach is currently considered to be applicable in this setting. However, additional aquifer testing and/or groundwater flow modeling may be needed to confirm suitability for the area downgradient of AP-1.	Engineered phytoremediation is a proven technology where hydrogeologic factors are taken into account (e.g., hydraulic conductivity, flow velocity, depth to impacted groundwater zone, etc.). This is considered an active remedial approach through the use of trees as the "pumps" driving the system. Careful design will be needed to select the proper species, which will include consideration of groundwater chemistry, plant uptake of constituents, and groundwater flow modeling to evaluate the required number and placement of TreeWell® units.	Reasonably implementable to moderate. Engineered approach has been proven effective, and specific depth zones can be targeted. Trees are installed as "tree wells" in a large diameter boring to get the roots deep enough to intercept impacted groundwater flow paths. Area must be clear of above- and below-ground structures (i.e., power lines). The system, once established (approximately three growing seasons), is a self-maintaining, sustainable remedial system that has no external energy requirements and little maintenance (i.e., efforts normally associated with landscaping).
Subsurface Vertical Barrier Walls	This approach involves placing a barrier to groundwater flow in the subsurface, frequently around a source area, to prevent future migration of dissolved constituents in groundwater from beneath the source to downgradient areas. In general, barrier walls are designed to provide containment; localized treatment achieved through the sorption or chemical precipitation reactions from construction of the walls are incidental to the design objective. Barrier walls can also be used in downgradient applications; to limit discharge to a surface water feature or to reduce aquifer recharge from an adjacent surface water feature when groundwater extraction wells are placed near one. A variety of barrier materials can be used, including cement and/or bentonite slurries, geomembrane composite materials, or driven materials such as steel or vinyl sheet pile. Groundwater extraction from upgradient of the barrier is required to avoid groundwater mounding behind the barrier.	Barrier walls are a proven technology for seepage control and/or groundwater cutoff at impoundments. Slurry walls are limited by the depth of installation; sheet piling and trenching are typically limited to depths of approximately 50 feet below ground surface (ft bgs); specialty drilling/installation techniques can achieve depths greater up to approximately 90 ft bgs. However, site-specific geologic and technology-specific considerations may limit this depth to shallower installations. Within the context of AP-1, a barrier wall might be used in conjunction with a "funnel and gate" system for a PRB rather than a stand-alone technology. As such, groundwater with Co and Mo above GWPS could either be directed to "treatment gates" for passive treatment (in a PRB) or migration of impacted groundwater could be minimized via barrier wall installation. Additional subsurface investigations, aquifer testing, and compatibility testing with site-specific groundwater will be needed.	Generally reliable as a barrier to groundwater flow; however, treatment of downgradient groundwater is incidental and not the primary objective.	Moderate to difficult. Trenching will be required to fill in the various slurry mixes; alternatively, sheet pile installations can be accomplished without excavation of trenches. The application of barrier walls is limited by the depth of installation, which similar to PRBs, should be keyed into a low permeability layer such as a thick clay layer or bedrock. Installation methods and materials are readily available. Once installed, above-ground infrastructure to pump and treat groundwater will be required. O&M requirements are expected to include upkeep of infrastructure components (pumps, pipes, tanks, instrumentation and controls, above-ground treatment system) and handling of treatment residuals. Technically infeasible to construct a barrier at the required depths to address the aquifer zone in the vicinity of BGWC-43D (>150 ft below ground surface).

Table 1
 Evaluation of Remedial Technologies
 Plant Bowen AP-1, Bartow County, Georgia

Corrective Measure	40 CFR 257.96(C)(1)	40 CFR 257.96(C)(2)	40 CFR 257.96(C)(3)
	Potential Impacts	Time Requirement to Begin/Complete	Institutional Requirements
Geochemical Approaches (In-Situ Injection)	Minimal impacts are expected if remedy works as designed, based on a thorough pre-design investigation, geochemical modeling, and bench/pilot study results. Redox-altering processes have the potential to mobilize naturally-occurring constituents as an unintended consequence if not properly studied and implemented.	Installation of the injection network can be accomplished relatively quickly (1 to 2 months). However, a thorough pre-design investigation, geochemical modeling, and/or bench- and/or pilot-testing will be required to obtain design parameters prior to design and construction of the corrective measure, which may take up to 24 months. Once installed, the time required to achieve GWPS within the treatment area may be relatively quick but depends on the attenuation process kinetics of each targeted constituent. The time for complete distribution of the injected materials throughout the treatment area is also variable.	Deed restrictions may be necessary until in-situ treatment has achieved GWPS. A new UIC permit (for in-situ injections) would be required to implement this corrective measure. No other institutional requirements are expected at this time.
Hydraulic Containment ("Pump and Treat")	Moderate. The main potential impacts are related to the presence and operation of an on-site above-ground water treatment facility and related infrastructure to convey and treat extracted groundwater. Pumping activity may unintentionally alter the geochemistry within the hydraulic capture zone.	Installation of extraction wells and/or trenches can be accomplished relatively quickly (1 to 2 months). However, additional aquifer testing, system design and installation, and permit approval may be required, which may take up to 24 months. The initiation of the approach would be contingent on the start-up of the wastewater treatment infrastructure. Hydraulic containment can be achieved relatively quickly after startup of the extraction system, but uncertainty exists with respect to the time to achieve GWPS without additional data collection to better understand attenuation mechanisms for Co and Mo.	Depending on the effluent management strategy, modifications to the existing NPDES permit may be required, or obtaining a new underground injection control (UIC) permit may be needed if groundwater reinjection is chosen. In addition, deed restrictions may be required as long as groundwater conditions are above regulatory standards for unrestricted use.
Monitored Natural Attenuation (MNA)	None. MNA relies on the natural processes active in the aquifer matrix to reduce constituent concentrations without disturbing the surface or the subsurface.	The infrastructure to initiate MNA is already in place. Demonstrating attenuation mechanisms and capacity can be time-consuming and can take up to 24 months. Under current conditions, MNA appears to already be sufficiently operational to attenuate site-specific constituents, and MNA is expected to continue to be successful following pond closure. Engineering measures will be implemented during closure of AP-1 to minimize potential impacts to the subsurface during closure activities and routine groundwater monitoring will be used to verify that groundwater impacts remain stable or decrease over time. A contingency plan will be developed to address potential impacts during and after pond closure should MNA not be successful as a stand-alone corrective measure.	MNA may require the implementation of institutional controls, such as deed restrictions, to preclude potential exposure to groundwater within the footprint of impacted groundwater until GWPS are achieved.
Permeable Reactive Barrier	Minimal impacts are expected following the construction of the remedy. However, ZVI has the potential to create anaerobic conditions downgradient of the PRB wall that may mobilize redox-sensitive naturally-occurring constituents. These conditions need to be carefully monitored. Short-term impacts during the construction of the remedy can be mitigated through appropriate planning and health and safety measures.	Installation of a PRB can be accomplished relatively quickly (6 to 12 months), depending on the final location and configuration. However, bench- and/or pilot-testing would be required to obtain design parameters prior to design and construction of the remedy, which may take up to 24 months. Once installed, the time to achieve GWPS downgradient of the PRB is anticipated to be relatively quick.	Deed restrictions may be necessary for groundwater areas upgradient of the PRB (if not installed along the waste boundary). No other institutional requirements are expected at this time.
Phytoremediation / TreeWells	Minimal impacts are expected. In fact, there are several positive impacts expected, including enhanced aesthetics, wildlife habitat, and limited energy consumption.	The design phase will require some groundwater modeling for optimal placement of the TreeWell units, which may take up to 6 months. Depending on the number of required units, the installation effort is expected to last several weeks. Hydraulic capture/control is expected approximately three years after planting and system performance is expected to further improve over time.	Deed restrictions may be necessary for groundwater areas upgradient of the TreeWell system. No other institutional requirements are expected at this time.
Subsurface Vertical Barrier Walls	Minimal impacts are expected following the construction of the remedy. Short-term impacts during the construction of the remedy can be mitigated through appropriate planning and health and safety measures. Changes to groundwater flow patterns due to installation of the barrier wall are expected, which can affect other aspects of groundwater corrective action. Pumping activity may unintentionally alter the geochemistry within the hydraulic capture zone that may result in the mobilization of other constituents that may require treatment.	Installation of a barrier wall can be accomplished relatively quickly (6 to 12 months), depending on the final location and configuration. However, some design phase and additional aquifer and compatibility testing will be required, which may take up to 24 months. Once installed, preventing migration of constituents dissolved in groundwater is anticipated to be relatively quick. Since this approach does not treat the downgradient area of impacted groundwater but prevents migration from a source area, it will likely have to be maintained long-term and coupled with other approaches.	Deed restrictions may be necessary for groundwater areas downgradient of the barrier wall until remedial goals are met. No other institutional requirements are expected at this time.

Table 1
 Evaluation of Remedial Technologies
 Plant Bowen AP-1, Bartow County, Georgia

Corrective Measure	40 CFR 257.96(C)(3)		Relative Costs	Evaluation of Retainage
	Other Env or Public Health Requirements			
Geochemical Approaches (In-Situ Injection)	Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary. Potential mobilization of redox-sensitive constituents exists during implementation of an anaerobic attenuation approach. Following installation, the remedy is passive.		Medium (depending on expanse of injection network required and injectate volume required per derived design parameters)	Not retained for further analysis; impractical to conduct injections at the required depths (>150ft below ground surface); injections in the site geologic formations can be ineffective due to the highly anisotropic aquifer conditions and the resulting uncertainty that injection reagents would be distributed within the required treatment zones; Mo is the primary constituent of concern (Co naturally attenuating in vicinity of BGWC-22), yet immobilization of Mo with in-situ injections is less established and may prove less effective than other viable options.
Hydraulic Containment ("Pump and Treat")	Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary. Above-ground treatment components may need to be present for an extended period of time, generating residuals requiring management and disposal.		Medium to high (depending on remedy duration, complexity of above-ground treatment system, and volume of water processed)	Retained for further analysis; the installation of extraction wells is not being considered in the immediate vicinity of AP-1 due to geotechnical considerations in the context of the site-specific geology; may need to be used in conjunction with other potential groundwater corrective measures; could be considered an effective measure to maintain hydraulic control along Euharlee Creek as an interim groundwater treatment measure, if warranted.
Monitored Natural Attenuation (MNA)	Little to no physical disruption to remediation areas and no adverse construction-related impacts are expected on the surrounding community. Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary.		Low to medium	Retained for further analysis; may be used as a stand-alone corrective measure or in conjunction with other potential groundwater corrective measures (i.e., excavation/consolidation of CCR materials).
Permeable Reactive Barrier	None expected at this point. Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary. Following installation, the remedy is passive. However, certain treatment media (such as ZVI) have the potential to mobilize naturally-occurring constituents downgradient of the PRB.		Medium to high (for installation) - minimal O&M requirements if replacement is not necessary	Not retained for further analysis; impractical to construct a wall at the required depths (>150ft below ground surface); does not address downgradient groundwater when installed along the compliance boundary; potential for increased maintenance due to potential biofouling and mineral precipitation.
Phytoremediation / TreeWells	None expected at this point. Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary. Innovative and green technology may be positively received by various stakeholders. Following installation, the remedy is passive and does not require external energy.		Medium (for installation) - minimal O&M requirements	Retained for further analysis; feasible through targeted placement of TreeWell units downgradient of AP-1; likely needs to be used in conjunction with other potential groundwater corrective measures; could be considered an effective measure to maintain hydraulic control along Euharlee Creek as an interim groundwater treatment measure, if warranted.
Subsurface Vertical Barrier Walls	Based on the results of the Risk Evaluation Report (Geosyntec, 2021a), SSL-related constituents (As, Co, Mo) evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater is warranted based on the current data set. Georgia Power will proactively evaluate the data and update this evaluation, if necessary. Due to the need for groundwater extraction associated with barrier walls, above-ground treatment components may need to be present for an extended period of time, generating residuals requiring management and disposal.		Medium to high (depending on length and depth of wall, remedy duration and complexity of above-ground treatment system)	Not retained for further analysis; impractical to construct at the required depths (>150ft below ground surface); does not address downgradient groundwater when installed along the compliance boundary.

EXECUTIVE SUMMARY

Plant Bowen (site) is a four-unit, coal-fired, electric-generating facility that commenced operations in the 1970s and is located approximately nine miles southwest of Cartersville in Bartow County, Georgia. In preparation for the closure of Ash Pond 1 (AP-1), the conversion of the plant to dry handling was completed in 2020, and AP-1 no longer receives coal combustion residual (CCR) materials pursuant to the Federal CCR Rule, 40 CFR § 257, Subpart D (USEPA, 2020a) and the State CCR Rule, Ga. Comp. R. & Regs. 391-3-4-.10 (EPD, 2018a). Georgia Power will close AP-1 by excavation and consolidation of CCR material into an approximately 144-acre lined, multi-cell storage facility situated within the current footprint of AP-1. Georgia Power submitted a permit application for the closure of AP-1 to the Georgia Environmental Protection Division (EPD) on November 20, 2018. The final closure permit will require post-closure care including semiannual groundwater monitoring and reporting for at least 30 years following CCR removal.

This report presents the results of a risk evaluation for CCR constituents¹ exhibiting statistically significant levels (SSLs) in groundwater at AP-1 from samples collected between 2016 and June 2020. A conservative, health-protective approach was used that is consistent with United States Environmental Protection Agency (USEPA) risk assessment guidance, Georgia EPD regulations and guidance, and standard practice for risk assessment in the State of Georgia. Arsenic², cobalt, and molybdenum were previously identified as SSL-related constituents based on groundwater protection standards (GWPS) established for AP-1 (Geosyntec, 2020a). Molybdenum is not an SSL-related constituent based on the federal GWPS established in 40 C.F.R. § 257.95(h)(2) and does not exceed health-based criteria. USEPA revised the Federal CCR Rule on July 30, 2018, updating the GWPS for cobalt, lead, lithium, and molybdenum values (USEPA, 2018a). While the updated federal health-based GWPS are expected to govern cobalt and molybdenum, molybdenum was identified as an SSL-related constituent using the background-based GWPS established for AP-1 pursuant to the State CCR Rule.

Consistent with USEPA guidance, this risk evaluation used a tiered approach to evaluate potential risks, which included the following steps:

1. Development of a conceptual exposure model (CEM) for AP-1.
2. Initial groundwater risk screening: Comparison of groundwater concentrations of SSL-related constituents, arsenic, cobalt, and molybdenum, to conservative, health-protective criteria and/or background concentrations to assess whether they pose a risk to human health.

¹ The constituents included in the risk evaluation also occur naturally in the site geologic setting.

² An alternative source demonstration (ASD) has been submitted to Georgia EPD as part of the *2020 Annual Groundwater Monitoring & Corrective Action Report Ash Pond 1 Plant Bowen* indicating that the arsenic detections in BGWC-34D are not related to AP-1 (Geosyntec, 2021).

3. Refined groundwater risk evaluation: Perform a more refined analysis of Constituents of Potential Interest (COPIs) that were not screened out in the initial risk screening to assess whether they pose a potential risk to human health.
4. Surface water risk screening: For constituents identified as groundwater constituents of interest (COIs), comparison of surface water concentrations collected in January 2021 to conservative, health-protective criteria to assess whether they pose a potential risk to human health or the environment as an additional line of evidence.
5. Development of risk conclusions and identification of associated uncertainties.

Using this approach that includes multiple conservative assumptions, constituents evaluated from AP-1 are not expected to pose a risk to human health or the environment; therefore, no further risk evaluation for groundwater or surface water is warranted. Compliance monitoring for AP-1 will continue pursuant to the requirements of the Federal and State CCR Rules. Georgia Power will proactively evaluate the data and update this evaluation, if necessary.

1 INTRODUCTION

This report summarizes a risk evaluation of AP-1 at Georgia Power's Plant Bowen (site) located nine miles southwest of Cartersville, Georgia (**Figure 1**). The site has a single CCR ash pond that occupies an area of approximately 254 acres. In preparation for AP-1 closure, the conversion of the plant to dry handling was completed in 2020, and AP-1 no longer receives CCR. Georgia Power will close AP-1 by excavation and consolidation of CCR material into an approximately 144-acre lined, multi-cell storage facility situated within the current footprint of AP-1.

This risk evaluation provides additional technical review of the human health and environmental protectiveness associated with the closure of AP-1 with respect to constituent concentrations in groundwater identified at SSLs above GWPS. The evaluation relies on a conservative, health-protective approach that is consistent with the risk approaches outlined in Voluntary Remediation Program (VRP) (Georgia Voluntary Remediation Act, O.C.G.A. § 12-8-100) and USEPA Regional Screening Levels (RSLs) User's Guide (USEPA, 2020b). This evaluation also incorporated principles and assumptions consistent with the Federal and State CCR Rules.

The risk evaluation includes the development of a site-specific CEM and a stepwise screening process for identified SSL-related constituents for AP-1. Arsenic and cobalt have been identified as SSL-related constituents under the Federal and State CCR Rules in BGWC-34D and BGWC-22, respectively. Molybdenum has been identified as an SSL-related constituent under the State CCR Rule in BGWC-22.

The remainder of the report is organized as follows:

- **Section 2, Basis and Background for the Development of the Conceptual Exposure Model** – Presents site-specific information related to the site history, monitoring network, topography and surface hydrology, geology and hydrogeology, potential transport pathways, and receptors that could potentially be exposed to SSL-related constituents.
- **Section 3, Risk Evaluation Screening** – Describes the process for the initial risk-based screening of SSL-related constituents to identify COPIs in groundwater.
- **Section 4, Refined Risk Evaluation** – Describes the process for refined evaluation of the groundwater COPIs, including calculation of exposure point concentrations (EPCs) and analysis of concentration trends over time, as well as the risk screening process for those constituents evaluated in surface water in the adjacent downgradient surface water body.
- **Section 5, Uncertainty Assessment** – Describes the uncertainties associated with the risk screening process.
- **Section 6, Conclusions** – Presents the conclusions of the risk evaluation.

- ***Section 7, References*** – Provides reference information for the sources cited in this document.

2 BASIS AND BACKGROUND FOR THE DEVELOPMENT OF THE CONCEPTUAL EXPOSURE MODEL

This section provides a brief overview of the site location and operational history, site regulatory status, and geology/hydrogeology. A CEM representing the site-specific processes and conditions that are relevant to the potential migration of groundwater and potential exposure to AP-1 SSL-related constituents has been developed based on a review and compilation of information previously presented in site documents, including the *Hydrogeologic Assessment Report (Revision 1) – Ash Pond 1 (AP-1)* (Geosyntec, 2020b) and the *2020 Semiannual Groundwater Monitoring & Corrective Action Report* (Geosyntec, 2020a). The CEM includes a conservative evaluation of potential exposure pathways and potential human and ecological receptors.

2.1 Site Description

The site is located in Bartow County, Georgia, approximately nine miles southwest of Cartersville. The Etowah River is located to the northeast of AP-1 and Euharlee Creek is located to the west and northwest (**Figure 1**).

The site is a four-unit, coal-fired electric generating facility. AP-1 is a 254-acre impoundment located at Plant Bowen. The Notice of Intent to Initiate Closure of AP-1 at Plant Bowen was filed on December 31, 2020, and closure activities are being conducted in accordance with the Federal and State CCR Rules.

As detailed in the *2020 Semiannual Groundwater Monitoring & Corrective Action Report* (Geosyntec, 2020a) the certified compliance monitoring well network consists of 22 monitoring wells, four upgradient wells (BGWA-2, BGWA-29, BGWA-47D, and BGWA-48D) and 18 downgradient wells. As a part of the assessment monitoring program, 16 additional piezometers have been installed since 2018. There are 18 compliance wells, 14 delineation wells, and 16 piezometers intended for monitoring of conditions downgradient of AP-1:

Downgradient Compliance Monitoring Wells

BGWC-7	BGWC-8	BGWC-9	BGWC-10	BGWC-12

PZ-5	PZ-6			

The monitoring well network for AP-1 is shown on **Figure 2**. Based on the conceptual site model and observed hydrogeologic conditions at the site, downgradient well locations are distributed along the northern, western, and southern perimeter of the site, in the direction of groundwater flow.

2.1.1 Topography and Surface Hydrology

The Great Valley District is a continuous basin spanning the eastern side of the Valley and Ridge, characterized by typically broad and open landscape with a few scattered ridges and hills. Elevations throughout the area range from approximately 650-800 feet above mean sea level (amsl) with relief of 50 to 100 feet. The topography of the AP-1 north stack forms a concave downward mound that slopes from the center of the stack to the perimeter, with a peak elevation of about 780 feet amsl. The southern half of AP-1 has a peak elevation of 760 feet amsl at its center. The topography surrounding AP-1 slopes toward Euharlee Creek to the west and the Etowah River to the north. Topographic relief south of AP-1 appears to slope toward the west to Euharlee Creek (Geosyntec, 2020b).

The site is located within the watershed of the Etowah River, which is located to the northeast of AP-1, and flows from Dahlenega to Rome, Georgia. Euharlee Creek located just west and northwest of AP-1, joins the Etowah River in Euharlee, Georgia (Geosyntec, 2020b).

2.1.2 Geology and Hydrogeology

The following information is provided in the *2020 Semiannual Groundwater Monitoring & Corrective Action Report – Plant Bowen - Ash Pond 1* (Geosyntec, 2020a) and presented below:

The Site is located within the Great Valley District of the Valley and Ridge Physiographic Province (Valley and Ridge) in northwest Georgia. The Valley and Ridge is characterized by Paleozoic sedimentary rocks that have been folded and faulted into the ridges and valleys that gave this region its name. The floor of the valley is underlain by shales, dolomites, and limestones of Cambrian and Ordovician age. Geologic mapping performed by Lawton et al. (1976) indicates that the Site is underlain by the Ordovician-Cambrian age Knox Dolomite and the Ordovician age Newala Limestone. Based on review of subsurface investigations at the Site, the

bedrock is described as predominantly dolomite. The overall Site is underlain primarily by residuum and competent dolomite/limestone bedrock. AP-1 is underlain primarily by three lithologic units: (i) fill material consisting of earthen embankments and CCR material, (ii) residuum, and (iii) competent dolomite/limestone bedrock.

....

The uppermost aquifer at the Site is a regional groundwater aquifer that occurs near the interface of the residuum and the fractured and solutioned bedrock. Groundwater recharge is by precipitation infiltrating through the residuum to bedrock, or in bedrock outcrop areas, it infiltrates directly into the bedrock. Groundwater flow in bedrock is under unconfined to semi-confined conditions from the mantle of overlying lower permeability residuum and is controlled by secondary porosity along fractures and solution-enhanced features. Based on observations of residuum soil types and horizontal hydraulic conductivity values, the movement of groundwater in the residuum and upper weathered bedrock zone is slow and likely behaves as flow through low-permeability porous media. Groundwater flow in the underlying dolomite/limestone bedrock is likely controlled by preferential flow pathways associated with fractures and solution-enhanced joints and fissures.

The potentiometric surface contours provided in the *2020 Semiannual Groundwater Monitoring & Corrective Action Report – Plant Bowen - Ash Pond 1* (Geosyntec, 2020a) are provided on **Figure 3**. The potentiometric surface contours show that groundwater flow direction is to the north, west, northwest, and southwest of AP-1.

2.2 Potential Transport Pathways

A variety of geologic, hydrogeologic, and geochemical mechanisms can occur in the subsurface and serve to attenuate constituent concentrations in groundwater such as soil or rock characteristics, the local geology and hydrogeology, and the distance the groundwater must travel before reaching a potential receptor. A summary of potential transport pathways is shown on the CEM in **Figure 4**.

Euharlee Creek is located on-site to the west and northwest of AP-1. The surface water flow of Euharlee Creek is to the north toward the Etowah River (**Figure 2**). A conservative assumption for this assessment was made that groundwater from the site flows to either Euharlee Creek or the Etowah River. In addition, for the purposes of this evaluation, Euharlee Creek and the Etowah River are assumed to represent hydraulic discharge boundaries for groundwater flow in the upper aquifer.

2.3 Potential Exposure Pathways and Receptors

The exposure pathways for groundwater were assumed to be complete for purposes of this risk evaluation and were used to identify potential receptors and estimate potential risk. The CEM (**Figure 4**) depicts the conservative potential exposure pathways and receptors included in the risk evaluation.

The following potential exposure pathways and receptors were considered:

- On-site industrial worker: The groundwater exposure pathway for the on-site industrial worker was considered incomplete because there are no wells on-site that are classified for potential use as potable wells.
- On-site construction worker: While there is a potential for limited exposure to groundwater by a future construction worker through dermal contact with on-site shallow groundwater during subsurface activities, future construction workers would be expected to have little to no direct contact with on-site groundwater due to safety procedures outlined in their site-specific health and safety plans.
- On-site resident: The groundwater exposure pathway for on-site residents was considered incomplete because the site is zoned agricultural district, general industrial, and heavy industrial. The Georgia Power property to the west of Euharlee Creek is part of the incorporated city of Euharlee. There is no residential use on-site under current site conditions and future residential use of the site is considered unlikely (Bartow County, 2020).
- Off-site industrial/construction worker: The potential for off-site worker exposure through direct contact with groundwater was addressed qualitatively through the evaluation of hypothetical off-site residential receptors. Health-protective screening levels for residential receptors would be more conservative than industrial and construction worker screening levels.
- Off-site resident: The groundwater exposure pathway for hypothetical off-site residential receptors was conservatively assumed to be potentially complete. Nearby zoning includes general and heavy industrial, rural estate district, and agricultural. The residential zoned properties are located upgradient of the site. Additionally, Georgia Power's property located to the west of Euharlee Creek is part of the incorporated city of Euharlee (Bartow County, 2020). An off-site well survey of potential groundwater wells within a three-mile radius of AP-1 was conducted and consisted of reviewing federal, state, and county records and online sources, in addition to conducting a windshield survey of the area (Newfields, 2020). The off-site well survey is included as **Appendix A**. Results of the survey are presented on **Figure 5**. Hypothetical off-site

residential receptors in the downgradient groundwater flow direction identified in the well survey are located on the opposite side of Euharlee Creek and the Etowah River, which for the purpose of this risk evaluation were assumed to represent hydraulic discharge boundaries for groundwater downgradient of AP-1.

Concentrations of the SSL-related constituents in on-site groundwater monitoring wells and piezometers were either below health-protective screening levels or background in wells on-site and upgradient of surface water bodies at AP-1 (cobalt and molybdenum) or were not detected (arsenic) above health-protective or ecological screening criteria in the adjacent downgradient surface water body (i.e. Euharlee Creek). As a conservative measure, hypothetical off-site residential exposure to SSL-related constituents was evaluated using data collected from on-site groundwater wells between 2016 and June 2020 around the perimeter and downgradient of AP-1. This comparison makes the conservative assumption that on-site groundwater has the potential to migrate to off-site drinking water wells through advective transport in groundwater without any attenuation within the aquifer media through factors such as dilution, dispersion, or adsorption, and disregarding the presence of Euharlee Creek which represents an assumed hydraulic discharge boundary for groundwater downgradient of AP-1. Accordingly, the risk evaluation screening assumed the hypothetical off-site residential receptor could be exposed by ingestion and dermal contact with SSL-related constituents in groundwater through its use as a future potable water source.

- Recreational surface water receptors: The potentially complete surface water exposure pathway for hypothetical recreational receptors was addressed through the evaluation of data from surface water samples collected from Euharlee Creek. The surface water risk evaluation conservatively assumed that hypothetical recreators' exposure included ingestion of aquatic organisms (mainly fish) and potential incidental ingestion and dermal contact with surface water by hypothetical adult and child recreational receptors.
- Ecological surface water receptors: The surface water exposure pathway for ecological receptors was addressed through the evaluation of surface water samples collected from Euharlee Creek. Ecological receptors were assumed to be exposed to surface water through direct contact to surface water as well as through the food chain pathway.

3 RISK EVALUATION SCREENING

The CEM developed in Section 2 was used to identify the potentially completed exposure pathways to human and ecological receptors that should be considered in the risk evaluation. The initial step in the risk evaluation is the comparison of SSL-related constituent concentrations from groundwater samples collected between 2016 through June 2020 to relevant, health-protective screening levels. The approach used is consistent with the Georgia EPD regulations and guidance, USEPA guidance, and standard practice for risk assessment in the State of Georgia. The Georgia EPD allows for the evaluation of risk to support site-specific remedial approaches in programs such as the Voluntary Remediation Program (VRP) (EPD, 2009).

The initial risk evaluation screening was performed for the potential groundwater exposure pathway by comparing the concentrations of arsenic in groundwater samples collected from BGWC-34D³ and cobalt and molybdenum in groundwater samples from monitoring well BGWC-22 to health-protective screening criteria. These criteria included the risk reduction standards (RRS) established under the Hazardous Site Response Act (HSRA) for drinking water for the protection of human health. If the maximum concentration of a SSL-related constituent exceeded the screening criterion, the constituent was identified as a COPI for further evaluation in the refined risk evaluation. The methodology and screening criteria used were identified in accordance with regulatory guidance and standard risk assessment practices using an approach designed to conservatively overestimate possible exposures and risks, providing an additional level of confidence in the conclusions. The methodology is summarized on **Figure 6** and discussed in more detail below.

3.1 Data Used in Risk Evaluation Screening

This section provides information on the site-specific groundwater and surface water datasets used in the risk evaluation screening.

3.1.1 Groundwater Data

For the initial risk screening evaluation, groundwater data from samples collected between 2016 through June 2020 from the on-site wells that were identified to have SSL-related constituents were used in the risk screening evaluation for hypothetical off-site residential exposure. For monitoring well BGWC-22, cobalt was previously identified as an SSL-related constituent under the Federal and State CCR Rules and molybdenum was identified as an SSL-related constituent under the State CCR Rule. For monitoring well BGWC-34D, arsenic was previously identified as an SSL-related constituent under the Federal and State CCR Rules. Concentrations

³ An ASD has been submitted to Georgia EPD as part of the *2020 Annual Groundwater Monitoring & Corrective Action Report Ash Pond 1 Plant Bowen* indicating that the arsenic detections in BGWC-34D are not related to AP-1 (Geosyntec, 2021).

of arsenic identified in BGWC-34D were also determined to not be related to AP-1 and an ASD has been submitted to Georgia EPD as part of the *2020 Annual Groundwater Monitoring & Corrective Action Report Ash Pond 1 Plant Bowen* (Geosyntec, 2021). However, the concentrations of arsenic detected in BGWC-34D were included in the risk evaluation for completeness despite not being attributed to AP-1.

The data from these wells for the SSL-related constituents were screened against relevant health-protective screening criteria. The wells with SSL-related constituents are depicted on **Figure 7** and the groundwater dataset used in the risk evaluation is presented in **Appendix B-1**. Groundwater data used in the risk screening level evaluation is considered to be representative of groundwater conditions at the site. Method detection limits for the groundwater datasets used in the risk evaluation were reviewed and confirmed to be less than the screening levels.

3.1.2 Background Groundwater Quality

Statistical analysis of groundwater monitoring data is performed at the site pursuant to §257.93-95 following the professional engineer (PE)-certified Statistical Analysis Method Certification (October 2017; revised January 2020) (Geosyntec, 2020c) and the Unified Guidance (USEPA, 2009) for AP-1; background values are routinely updated under the program. The statistical analyses performed on the groundwater data were described in the *2019 Annual Groundwater Monitoring & Corrective Action Report - Plant Bowen Ash Pond 1 (AP-1)* (Geosyntec, 2020d) and text from that document is presented below.

The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package, that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations and guidance as recommended in the USEPA document Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance (Unified Guidance) (USEPA, 2009).

Time series plots generated by Sanitas are used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells for Appendix III and Appendix IV parameters are formally tested using Tukey's box plot method and not used to establish statistical limits. Background well data were updated following the Unified Guidance recommendation, evaluating recent background data using Tukey's box plot method for outliers and Sen's Slope/Mann-Kendall methods for potential trends.

3.2 Groundwater Screening Evaluation

The process of screening constituents detected in groundwater against human health screening levels for groundwater is discussed below and presented in **Figure 6**. The HSRA RRS evaluated under the VRP approach presented herein included Type 1 and Type 2 standards for off-site residential receptors. The HSRA, Rule 391-3-19.07(1) notes that “[a]ll risk reduction standards will, when implemented, provide adequate protection of human health and the environment.” In addition, Rule 391-3-19.07(3) notes a corrective action, if needed, may be considered complete when “a site meets any or a combination of the applicable risk reduction standards described in Rule 391-3-19-.07.”

In accordance with standard methodologies approved by the Georgia EPD, the screening level hierarchy for the SSL-related constituents is as follows:

- The higher of the Type 1 or Type 2 RRS for hypothetical off-site residential exposure, which are considered protective of human health for those constituents regulated under HSRA. The Type 1 RRS was used for arsenic, which is the Georgia drinking water criteria presented in Appendix III, Table 1 of the HSRA rule (EPD, 2018b).
- In accordance with standard methodologies approved by the Georgia EPD and because RRS have not already been established for cobalt and molybdenum under HSRA, site-specific risk-based screening values were calculated using the default exposure factors for residential receptors and the methodology found in Appendix III of the HSRA Rule (EPD, 2018b). Accordingly, the calculated screening values are equivalent to Type 2 groundwater RRS protective of potential residential exposures. Toxicity values for cobalt and molybdenum used in the calculations were identified in the Integrated Risk Information System (IRIS) (USEPA, 2020c). The risk-based screening values were calculated using USEPA’s RSL calculator (USEPA, 2020b) assuming a target hazard quotient of 1, consistent with Georgia EPD guidance applicable in other contexts (EPD, 2018b). The calculations of the risk-based screening values for cobalt and molybdenum are presented in **Appendix C**. Based on the foregoing, site-specific screening levels were used for cobalt and molybdenum.
- If site-specific background concentrations are greater than the criteria described above, then the site-specific background concentration is used as the screening level in accordance with the CCR Rule methodology for development of groundwater protection (USEPA, 2020a). Background was not used as a screening level in this evaluation.

In summation, based on the hierarchy above, groundwater data collected from the wells identified to have SSL-related constituents were compared to residential screening criteria for groundwater.

Table 1 presents the maximum detected concentration of each SSL-related constituent from 2016 to June 2020, arsenic (0.020 mg/L), cobalt (0.027 mg/L), and molybdenum (0.076 mg/L), which was used to represent potential off-site groundwater quality for comparison to the selected screening levels, arsenic (0.01 mg/L), cobalt (0.006 mg/L), and molybdenum (0.1 mg/L), for hypothetical off-site residential receptors. As noted in **Table 1**, arsenic and cobalt were detected at concentrations that exceeded their screening levels and were retained as COPIs for further evaluation in the refined risk evaluation. Molybdenum, however, was not detected at concentrations that exceeded its screening level and was not retained as a COPI; therefore, no refined evaluation was performed for this SSL-related constituent.

3.3 Alternative Source Demonstration

In accordance with 40 CFR §257.95, an ASD was prepared for arsenic in BGWC-34D at AP-1 (Geosyntec, 2021). Based on review of available site data, the arsenic detected in well BGWC-34D is not associated with a release from AP-1 but is instead caused by a natural source of arsenic in the site-specific rock formation. The ASD submitted with the *2020 Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company, Plant Bowen, Ash Pond 1 (AP-1)* (Geosyntec, 2021) provides the following information supporting this conclusion:

- The arsenic detection above the GWPS in well BGWC-34D is an isolated occurrence in a deeper flow zone that has a distinctly different geochemistry from the shallower groundwater that is more similar to background conditions than to other compliance wells.
- Samples of rock cores contain arsenic at concentrations higher than average crustal abundance; samples collected from the core for BGWC-34D at the screened depth interval of that well have the highest arsenic concentrations [i.e., up to 13 milligrams per kilogram (mg/kg)] relative to the other rock core samples collected from depth intervals coinciding with the screened intervals of various compliance and detection monitoring wells. Other solid samples had arsenic detections between 0.8 mg/kg and 3.5 mg/kg. Elevated, naturally-occurring arsenic within North Georgia has been well documented in the literature and is most likely associated with arsenic-bearing minerals such as pyrite. Similarly, the occurrence of arsenic in well BGWC-34D is related to its natural occurrence and distribution in the subsurface geologic media.

The ASD demonstrates that concentrations of arsenic in BGWC-34D are naturally occurring. However, for completeness, arsenic was carried forward into the refined risk evaluation.

4 REFINED RISK EVALUATION

A refined risk evaluation was conducted for the groundwater COPIs (arsenic and cobalt) that were detected in BGWC-34D and BGWC-22, respectively, that exceeded the health-protective screening criteria. The refined risk evaluation identified EPCs for arsenic and cobalt in groundwater for the purposes of characterizing potential risk to human receptors. If the EPC is greater than the respective screening level, then the constituent is identified as having the potential for risk that warrants additional evaluation.

4.1 Refined Groundwater Risk Evaluation

Potential risk associated with exposure to arsenic and cobalt by hypothetical off-site residential receptors was refined using the methodology described in the HSRA and VRP guidance (EPD, 2018b; EPD, 2009) and is presented in the following section and on **Figure 8**.

For the refined risk evaluation, groundwater data from samples collected between 2016 and June 2020 from the on-site wells identified to have SSL-related constituents, BGWC-22 and BGWC-34D, and downgradient wells that represent groundwater flow in the same hydraulically downgradient direction, presented below, were used for evaluating hypothetical off-site residential exposure.

BGWC-20	BGWC-22	BGWC-31	BGWC-32	BGWC-35D
BGWC-37D	BGWC-39			

As noted above, groundwater data used in the risk screening level evaluation were considered to be representative of groundwater conditions at the site. The groundwater dataset used in the refined risk evaluation is presented in **Appendix B-1**.

4.1.1 Groundwater Exposure Point Calculation

The refined risk evaluation for arsenic and cobalt included the development of an EPC for each constituent. The EPC is a conservative estimate of potential exposure that is selected to address uncertainty and variability in the dataset (USEPA, 2002). Consistent with USEPA guidance for developing groundwater EPCs (USEPA, 2014), 95 percent upper confidence limits of the arithmetic mean (UCLs) were calculated using USEPA ProUCL 5.1 software (ProUCL) (USEPA, 2016) and the *ProUCL User's Guide* (USEPA, 2015a). For the refined risk evaluation, the UCLs for the COPIs in groundwater were calculated for the following specific datasets:

- UCLs for the individual well(s) with an SSL-related constituent;
- UCLs based on combined data from well(s) with SSL-related constituents and other well(s)/piezometer(s) in the general vicinity to include additional downgradient monitoring well(s)/piezometer(s) that represent groundwater flow in the same hydraulically downgradient direction; and

- UCLs based on the combined data from the farthest downgradient well(s)/piezometer(s) that are hydraulically downgradient of the well(s) with the SSL-related constituents.

Other assumptions made in the calculations of the UCLs include:

- Primary samples (no duplicates) were used to calculate EPCs as duplicate samples were analyzed for quality assurance purposes.
- If the calculated UCL exceeded the maximum detected concentration, then the maximum detected concentration was used as the EPC.

ProUCL software calculates multiple UCLs and provides a recommended UCL which was selected as the EPC. If there were multiple UCLs recommended by ProUCL, the maximum UCL value was selected as a conservative assumption. **Appendix D-1** provides a detailed summary of the UCLs calculated using the methods described above, and **Appendix D-2** presents figures showing the wells used in the calculation of the EPCs for each groundwater COPI. **Appendix D-3** provides the input and output files associated with the ProUCL software.

Table 2 summarizes the groundwater EPCs selected for arsenic and cobalt. This table shows the number of samples, the maximum detected concentration, the UCL recommended by ProUCL software, and the selected EPC.

4.1.2 COPI Concentration Trend Analysis

Concentration trends over time were evaluated as one line of evidence in the refined risk evaluation for arsenic and cobalt. The Mann-Kendall trend test with an alpha value equal to 0.05 and the Theil-Sen line test were conducted on the data from BGWC-20, BGWC-22, BGWC-31, BGWC-32, BGWC-34D, and BGWC-35D for arsenic and cobalt to evaluate the trends in concentrations over time. The tests were conducted using the USEPA ProUCL 5.1 software (USEPA, 2016).

The Mann-Kendall and Thiel-Sen results are presented on time series graphs in **Appendix D-4** and indicated:

- There are no statistical trends in arsenic concentrations over time in BGWC-20, BGWC-31, and BGWC-34D;
- There are no statistical trends in cobalt concentrations over time in BGWC-32 and BGWC-35D; and
- There is a statistically significant increasing trend in cobalt concentrations over time in BGWC-22. However, the cobalt concentrations in two samples collected from BGWC-37D and the two samples collected from BGWC-39, the farthest hydraulically downgradient wells from BGWC-22, were less than the screening level.

4.1.3 Refined Groundwater Risk Evaluation Results

Arsenic and cobalt were identified as a groundwater COPI in the initial risk screening. In the refined risk evaluation, comparison of the calculated EPC to the screening level was used to identify constituents of interest (COIs) that may pose a potential risk to hypothetical off-site residential receptors exposed through the potential use of groundwater as potable water. If the EPC from the farthest downgradient well(s) is greater than the respective screening level, then the constituent is identified as having the potential for risk that warrants additional evaluation (e.g., performing a surface water evaluation).

4.1.3.1 Arsenic

Arsenic concentrations were detected in seven out of seven groundwater samples in well BGWC-34D at concentrations that exceeded the off-site groundwater screening level for residential receptors. For the refined risk evaluation, the following EPCs were calculated for arsenic using the wells shown in **Appendices D-1** and **D-2**:

- Data from BGWC-34D were used to determine if the UCL is less than the screening level (EPC Step 1 in **Appendix D-1**).
- Data from BGWC-34D, adjacent/nearby well BGWC-20, and downgradient well BGWC-31 were combined to represent potential groundwater exposure in the same hydraulically downgradient direction (EPC Step 2 in **Appendix D-1**).
- For reasons described below, a third UCL was calculated using data from the downgradient well BGWC-31 to represent groundwater exposure using the well that is the farthest hydraulically downgradient of well BGWC-34D (EPC Step 3 in **Appendix D-1**), but as a conservative measure, an evaluation of surface water was also performed.

Although both the EPC Step 1 (0.019 mg/L) and the EPC Step 2 (0.011 mg/L) exceeded the applicable screening level, the EPC Step 3 (0.0053 mg/L), which is the maximum detected concentration from the farthest downgradient well, was less than the applicable screening level.

As mentioned above, surface water was also evaluated for arsenic to add an additional line of evidence to support the conclusion that there is no risk to hypothetical recreators in Euharlee Creek from arsenic concentrations in BGWC-34D. This conservative approach was based on the potential variability of groundwater flow from BGWC-34D. The groundwater elevation data collected over time suggests there may be some variability in the groundwater flow direction such that groundwater may flow to both the northwest (toward BGWC-31) and west (toward Euharlee Creek) at different times.

Table 3 presents the results of the refined screening comparing the EPC Step 3 to the screening criterion. Arsenic was not identified as a constituent of interest (COI) in groundwater for hypothetical off-site residential receptors but is further evaluated below for the reasons discussed above.

4.1.3.2 Cobalt

Cobalt concentrations were detected in 21 out of 24 groundwater samples in wells BGWC-22 and BGWC-32, a well downgradient of BGWC-22 with a cobalt exceedance, at concentrations that exceeded the off-site groundwater screening level for residential receptors. For the refined risk evaluation, the following EPCs were calculated for cobalt using the wells shown in **Appendices D-1** and **D-2**:

- Data from BGWC-22 were used to determine if the UCL is less than the screening level (EPC Step 1 in **Appendix D-1**).
- Data from BGWC-22 and wells, BGWC-32, BGWC-35D, BGWC-37D, and BGWC-39 were combined to represent potential groundwater exposure in the same hydraulically downgradient direction (EPC Step 2 in **Appendix D-1**).
- Data from BGWC-39 were used to represent groundwater exposure using the well that is the farthest hydraulically downgradient of well BGWC-22 (EPC Step 3 in **Appendix D-1**).

Although both the EPC Step 1 (0.018 mg/L) and the EPC Step 2 (0.012 mg/L) exceeded the screening level, the EPC Step 3 (0.00047 mg/L) was less than the applicable screening level.

Table 3 presents the results of the refined screening comparing the farthest hydraulically downgradient EPC to the screening criterion. Cobalt was not identified as a constituent of interest (COI) in groundwater for hypothetical off-site residential receptors and is not expected to pose a risk to human health through potable water use.

4.2 Surface Water Risk Evaluation

As discussed in Section 4.1.3.1, a surface water screening evaluation for arsenic was conducted for Euharlee Creek. The surface water screening process is described below and presented in **Figure 9**.

Both human and ecological receptors have the potential to come into contact with surface water. Routes of exposure include ingestion of aquatic organisms (mainly fish) and potential incidental ingestion and dermal contact with surface water by adult and child recreational receptors. Potential routes of exposure for ecological receptors include direct contact to surface water and ingestion by aquatic receptors.

4.2.1 Surface Water Data

Surface water data for arsenic were collected during a January 2021 sampling event at a total of six locations in Euharlee Creek. The surface water sample locations are shown on **Figure 10**. The surface water dataset used in the risk evaluation is presented in **Appendix B-2**.

4.2.2 Human Health Screening

The following hierarchy of sources was considered in the process of selecting the surface water human health screening value for arsenic:

- Georgia In-Stream Water Quality Criteria (ISWQC) for human health (EPD, 2015).
- National Ambient Water Quality Criteria (NAWQC) for human health protective through ingestion of water and organisms (USEPA, 2015b). For select constituents for which no numerical values for surface water are provided, USEPA (2015b) states that “*EPA has issued an MCL [Maximum Contaminant Level] which may be more stringent*” suggesting the use of the MCL for surface water screening. This is a conservative approach.
- In accordance with standard practice using methodologies approved by the Georgia EPD, the higher of the residential groundwater screening levels described in Section 3.2.2 was used for the remaining constituents due to lack of human health surface water screening levels for these constituents, which is a conservative approach.
- Maximum detected upstream concentration if the maximum upstream surface water concentration is greater than the surface water screening value described above. Upstream concentrations were not used in this evaluation.

The ISWQC for human health was selected as the screening level for arsenic for comparison of surface water data collected from Euharlee Creek.

Arsenic was not detected in the surface water samples (<0.01 mg/L) and the reporting limit was below the surface water human health screening level (0.05 mg/L), as shown in **Table 4**. Therefore, arsenic was not retained as a human health COPI in surface water and is not expected to pose a risk to human health.

4.2.3 Ecological Screening

Surface water screening values for aquatic ecological receptors were selected from the following order of hierarchy for arsenic:

- Chronic freshwater Georgia ISWQC (EPD, 2015).
- USEPA Region 4 chronic freshwater screening levels (USEPA, 2018b).
- Maximum detected upstream concentration if the maximum upstream surface water concentration is greater than the surface water screening value described above. Upstream concentrations were not used in this evaluation.

The Chronic freshwater ISWQC was selected as the screening level for arsenic for comparison of surface water data collected from Euharlee Creek.

Arsenic was not detected in surface water (<0.01 mg/L) and the analytical reporting limits for all samples were lower than the ecological screening criteria (0.15 mg/L), as shown in **Table 5**. Therefore, arsenic was not retained as a COPI in surface water for further evaluation and is not expected to pose a risk to ecological receptors.

4.2.4 Refined Risk Evaluation Summary and Conclusions

Detections of arsenic and cobalt were reported at concentrations above the corresponding groundwater screening values. The results of the refined risk evaluation for groundwater indicate the following:

- Cobalt was not identified as a groundwater COI for hypothetical off-site residential receptors and is not expected to pose a risk to human health.
- Arsenic was not identified as a groundwater COI for hypothetical off-site residential receptors and is not expected to pose a risk to human health but was evaluated further in adjacent surface water in Euharlee Creek for potential exposure to human and ecological receptors as a conservative measure due to variability in the historical potentiometric groundwater surface contours.
- Arsenic was not detected in surface water samples from Euharlee Creek and the analytical reporting limits were below health-protective surface water screening criteria for human and ecological receptors. Therefore, arsenic was not retained as a COPI in surface water

for further evaluation and is not expected to pose a risk to human health or ecological receptors.

Accordingly, based on the multiple lines of evidence and various conservative assumptions, further risk evaluation for groundwater and surface water is not warranted. Compliance monitoring under the Federal and State CCR Rules will continue.

5 UNCERTAINTY ASSESSMENT

USEPA guidance stresses the importance of providing an analysis of uncertainties so that risk managers are better informed when evaluating risk assessment conclusions (USEPA, 1989). The uncertainty assessment provides a better understanding of the key uncertainties that are most likely to affect the risk assessment results and conclusions.

The potential uncertainties associated with the risk evaluation are as follows:

Health-Protective Screening Criteria Uncertainties:

The potential uncertainties associated with the risk evaluation are as follows:

- In accordance with standard methodologies approved by the Georgia EPD, an equivalent Type 1 or Type 2 standard was selected as the screening criterion for arsenic, cobalt, and molybdenum. Selection of the screening criteria is considered appropriate for risk quantification for AP-1. The Hazardous Site Response Act, Rule 391-3-19.07(1) notes that “[a]ll risk reduction standards will, when implemented, provide adequate protection of human health and the environment”. Thus, this approach is likely to overestimate hypothetical risks for off-site receptors.
- Screening criteria based on RRS, including arsenic, cobalt, and molybdenum, represent the reasonable maximum exposure (RME), which are the highest exposures that are reasonably expected to occur at a site. The RME is defined as “the highest exposure that is reasonably expected to occur at a site but that is still within the range of possible exposures” (USEPA, 1989). USEPA (1989) states that the “intent of the RME is to estimate a conservative exposure case (i.e., well above the average case) that is still within the range of possible exposures”. Potential receptors will likely have lower exposures than those presented in this risk evaluation (i.e., a majority of the site concentrations will be less than the UCL), which overestimates potential exposure.

Exposure Uncertainties:

- The maximum detected concentrations of arsenic, cobalt, and molybdenum were compared to conservative risk-based screening criteria to identify the COPIs. Use of the maximum detected concentration is consistent with standard practice; however, use of the maximum detected concentration for exposure likely overestimates potential risk.
- The constituents included in the risk evaluation, arsenic, cobalt, and molybdenum, may occur naturally in the site geologic setting. Although background concentrations were evaluated and used in the screening process, contributions to exposure and risk were assumed to be entirely CCR-related and natural background sources were not quantified. Thus, arsenic, cobalt, and molybdenum exposures were likely overestimated.

- Hypothetical off-site residential exposure was evaluated using on-site groundwater data from wells around the perimeter and downgradient of AP-1. This comparison makes the conservative assumption that on-site groundwater may potentially migrate to off-site drinking water wells through advective transport in groundwater, but without any attenuation within the aquifer media through factors such as dilution, dispersion, or adsorption. This assumption may overestimate potential exposure and risk to hypothetical off-site receptors.
- Although arsenic concentrations were delineated in on-site groundwater based on data from BGWC-31, the risk evaluation conservatively considered arsenic data from surface water samples collected from Euharlee Creek downgradient of BGWC-34D. Arsenic was not detected in surface water and the analytical reporting limits for all samples were lower than screening criteria. This highly conservative approach provides additional confidence in the conclusion that arsenic is not expected to pose a risk to human health or the environment.
- EPCs for metals in groundwater were assumed to be 100 percent bioavailable by ingestion and dermal contact. This assumption may tend to overestimate risk.
- An off-site well survey of potential groundwater wells within a three-mile radius of the site was conducted by NewFields in 2019 and consisted of reviewing publicly available federal, state, and county records as well as a windshield survey of the area (**Appendix A**). Geosyntec relied on the data collected by NewFields.
- The evaluation used on-site groundwater data to represent hypothetical off-site exposure, which is a conservative approach that likely results in overestimation of assumed exposure and assumed potential risk. Although off-site potable wells identified in the well survey were not included in the risk evaluation, the presence of these wells do not appear to impact the conclusions of the risk evaluation because concentrations of SSL-related constituents are either below health-protective screening levels in on-site groundwater or adjacent surface water.

Toxicity Uncertainties:

- Toxicity factors used to calculate health-protective criteria are established at conservative levels to account for uncertainties and often result in criteria that are many times lower than the levels observed to cause effects in human or animal studies. Therefore, a screening level exceedance does not necessarily equate to an adverse effect.

6 CONCLUSIONS

This risk evaluation for SSL-related constituents in groundwater at AP-1 was conducted using methods consistent with Georgia EPD and USEPA guidance and included multiple conservative assumptions. Based on this evaluation, constituents evaluated from AP-1 (arsenic, cobalt, and molybdenum) are not expected to pose a risk to human health or the environment.

Accordingly, no further risk evaluation of groundwater or surface water is warranted. Compliance monitoring for AP-1 under the Federal and State CCR Rules will continue. Georgia Power will proactively evaluate the data and update this evaluation, if necessary.

TABLES

Table 1
SSL-Related Constituent Groundwater Screening
Plant Bowen AP-1 Risk Evaluation Report^[1]
Plant Bowen, Cartersville, GA

CCR Rule Designation	Constituent	CAS No.	Detection Frequency	Exceedance Frequency ^[2]	Maximum Concentration (mg/L)	Screening Level (mg/L)	Source ^[3]	Site-Specific Background (mg/L)	COPI? (Y/N)	Rationale ^[4]
Appendix IV	Arsenic	7440-38-2	7 / 7	7 ^[5] / 7	0.020	0.01	Type 1 RRS	0.005	Y	ASL
	Cobalt	7440-48-4	17 / 17	17 / 17	0.027	0.006	Site-Specific	0.005	Y	ASL
	Molybdenum	7439-98-7	17 / 17	0 / 17	0.076	0.1	Site-Specific	0.034	N	BSL

Notes:

[1] Evaluation includes 2016 to June 2020 groundwater analytical data from wells BGWC-22 (for cobalt and molybdenum) and BGWC-34D (for arsenic).

[2] The exceedance frequency is based on the number of samples with detected concentrations that exceed the identified screening level.

[3] The screening values are the maximum value from the following sources:

- Type 1 RRSs listed in HSRA Appendix III, Table 1 (HSRA-regulated substances only).
- Type 2 RRSs calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide (HSRA-regulated substances only).
- Site-Specific values calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide.
- EPA Maximum Contaminant Levels (MCLs).
- Site-specific background levels for each constituent were calculated as described in the document "*Statistical Analysis Method Certification, 40 CFR §257.93(f)*," (Geosyntec, 2020d)

(Geosyntec, 2020d)

[4] Rationale for classification of constituent as a COPI or exclusion as a COPI:

- ASL = Above respective screening level
- BSL = Below respective screening level

[5] Seven concentrations of Arsenic that were above the arsenic screening level were observed in BGWC-34D. BGWC-34D concentrations of arsenic were observed to be naturally occurring and not associated with the Ash Pond as described in the Demonstration of Naturally Occurring Arsenic Memorandum submitted with the 2019 First Semiannual Groundwater Monitoring & Corrective Action Report for Plant Bowen AP-1 (July, 2019) and an ASD has been submitted for the arsenic concentrations detected in BGWC-34D as part of the 2020 Annual Groundwater Monitoring & Corrective Action Report for Plant Bowen Ash Pond 1 - AP-1.

Definitions:

Grey shading = 'Constituent concentration(s) exceeded its respective screening level in the dataset.'

CAS = Chemical Abstract Service

CCR = Coal Combustion Residuals

COPI = Constituent of Potential Interest

EPA = United States Environmental Protection Agency

GA EPD= Georgia Environmental Protection Division

HSRA = [GA EPD] Hazardous Site Response Act

mg/L = milligram(s) per liter

RRS = [GA EPD] Risk Reduction Standard

RSL = [EPA] Regional Screening Level

CCR Rule Designation	Constituent	CAS No.	Detection Frequency	Maximum Concentration (mg/L)	Wells Included in 95% UCL Calculation	95% UCL ^[1] (mg/L)	Recommended UCL Method ^[2]	Selected EPC (mg/L)
Appendix IV	Arsenic	7440-38-2	5 / 5	0.020	BGWC-31	0.0053	95% Student's-t UCL	0.0053
	Cobalt	7440-48-4	1 / 2	0.00047	BGWC-39	--	NA	0.00047

[1] EPCs calculated in accordance with USEPA, 2014. Memorandum for Determining Groundwater Exposure Point Concentrations, Supplemental Guidance. OSWER Directive 9283.1-42, February 2014. Located at: <https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=236917>. For further detail on the selected EPC, refer to Appendix D-1.

[2] NA = Not available. The 95% upper confidence limit on the mean (UCL) was not calculated because the dataset had fewer than 5 values.

Definitions:

CAS = Chemical Abstract Service

CCR = Coal Combustion Residuals

COPI = Constituent of Potential Interest

EPA = United States Environmental Protection Agency

EPC = Exposure Point Concentration

mg/L = milligrams per liter

Table 3
Downgradient Groundwater Refined Evaluation
Plant Bowen AP-1 Risk Evaluation Report
Plant Bowen, Cartersville, GA

CCR Rule Designation	Constituent	CAS No.	Detection Frequency	Exceedance Frequency ^[1]	Selected EPC (mg/L)	Screening Level (mg/L)	Source ^[2]	Site-Specific Background (mg/L)	COI? (Y/N)	Rationale ^[3]
Appendix IV	Arsenic	7440-38-2	5 / 5	0 / 5	0.0053	0.01	Type 1 RRS	0.005	N	BSL
	Cobalt	7440-48-4	1 / 2	0 / 2	0.00047	0.006	Site-Specific	0.005	N	BSL

Notes:

[1] The exceedance frequency is based on the number of samples with detected concentrations that exceed the identified screening level.

[2] The screening values are the maximum value from the following sources:

- Type 1 RRSs listed in HSRA Appendix III, Table 1 (HSRA-regulated substances only).
- Type 2 RRSs calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide (HSRA-regulated substances only).
- Site-Specific values calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide.
- Site-specific background levels for each constituent were calculated as described in the document "*Statistical Analysis Method Certification, 40 CFR §257.93(f), Plant Bowen - Ash Pond 1 (AP-1)*" (Georgia Power Company, 2020).

[3] Rationale for classification of constituent as a COPI or exclusion as a COPI:

- ASL = Above respective screening level
- BSL = Below respective screening level

Definitions:

CAS = Chemical Abstract Service

CCR = Coal Combustion Residuals

COPI = Constituent of Potential Concern

EPA = United States Environmental Protection Agency

RRS = Risk Reduction Standard

Table 4
Surface Water Human Health Screening
Plant Bowen AP-1 Risk Evaluation Report
Plant Bowen, Cartersville, GA

CCR Rule Designation	Constituents	CAS No.	Detection Frequency ^[1]	Exceedance Frequency ^[2]	Maximum Concentration (mg/L)	Screening Level (mg/L)	Source ^[3]	Site-Specific Background ^[4] (mg/L)	COPI? (Y/N)	Rationale ^[5]
Appendix IV	Arsenic	7440-38-2	0 / 5	0 / 5	<0.005	0.05	GA ISWQC	<0.005	N	ND/BSL

Notes:

[1] Evaluation includes January 2021 surface water analytical data from EC-0, EC-0.72, EC-0.75, EC-1.13, and EC-1.61.

[2] Selected exceedance frequency is for the specific constituent that exceeds the first screening value in the hierarchy of screening values.

- The hierarchy of screening values is GA ISWQC > NRWQC > The maximum between the Type 1 and Type 2 RRS
- For sites with site-specific background concentrations greater than all applicable screening values, the site-specific background value will be used as the screening value.

[3] The screening values are the maximum value from the following sources:

- GA ISWQC listed in GA Administrative Code 391-3-6-.0 (5)(e)(iii). Values have been adjusted as described in the Rule to compare dissolved concentrations to dissolved screening values and total concentrations to total screening values when appropriate. Conversion factors used to calculate dissolved criteria are found in the EPA document – National Recommended Water Quality Criteria – EPA 2006.
- Type 1 RRSs listed in HSRA Appendix III, Table 1 (HSRA-regulated substances only).
- Type 2 RRSs calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide (HSRA-regulated substances only).
- Site-Specific values calculated using the USEPA RSL calculator with default residential exposure factor listed in the RSL Users Guide.

[4] Site-specific background level for each constituent was selected as the maximum value of the sample collected upgradient of the ash pond.

[5] Rationale for classification of constituent as a COPI or exclusion as a COPI:

ASL = Above respective screening level;

BSL = Below respective screening level.

ND/BSL = Non-detect and below respective screening level

Definitions:

CAS = Chemical Abstract Service

CCR = Coal Combustion Residuals

COPI = Constituent of Potential Concern

EPA = United States Environmental Protection Agency

GA ISWQC = Georgia Instream Water Quality Criteria

NRWQC = National Recommended Water Quality Criteria

RRS = Risk Reduction Standard

Table 5
Surface Water Ecological Screening
Plant Bowen AP-1 Risk Evaluation Report
Plant Bowen, Cartersville, GA

CCR Rule Designation	Constituents	CAS No.	Detection Frequency	Exceedance Frequency ^[1]	Maximum Concentration (mg/L)	Screening Value (mg/L) ^[2,3]		Hardness Dependent? (Y/N)	Source ^[4]	Site-Specific Background (mg/L)	COPI (Y/N)	Rationale ^[5]
						Total	Dissolved					
						(mg/L)						
Appendix IV	Arsenic	7440-38-2	0 / 5	0 / 5	<0.005	0.15	0.15	N	GA ISWQC	<0.005	N	BSL

Notes:

[1] Selected exceedance frequency is for the specific constituent that exceeds the first screening value in the hierarchy of screening values.

- The hierarchy of screening value sources is GA ISWQC > EPA Region 4 (see footnote 10 for radium).

- For sites with site-specific background concentrations greater than all applicable screening values, the site-specific background value will be used as the screening value

[2] The dissolved fraction screening value and the total concentration screening value are presented with the selected screening value used for comparison to the maximum total concentration in bold.

[3] If the screening value listed in the GA ISWQC or EPA Region 4 source specified that it is applicable to the dissolved metal concentration, a screening level appropriate for comparison to the total metal concentration was calculated using the conversion factors presented in the *National Recommended Water Quality Criteria, Appendix A* (<https://www.epa.gov/wqc/national-recommended-water-quality-criteria-aquatic-life-criteria-table#a>).

[4] Screening values selected from GA ISWQC were selected from GA Administrative Code 391-3-6-.0 (5)(e)(iii) and values selected from EPA Region 4 source were selected from Table 1a of the *Region 4 Ecological Risk Assessment Supplemental Guidance* (EPA, 2018).

[5] Rationale for classification of constituent as a COPI or exclusion as a COPI:

ASL = Above respective screening level;

BSL = Below respective screening level.

Definitions:

CAS = Chemical Abstract Service

CCR = Coal Combustion Residuals

COPI = Constituent of Potential Concern

Legend

-----> A conservative assumption for this assessment was made that groundwater from the site flows to the downgradient surface water.

● Indicates potentially complete pathway to receptors, which are evaluated quantitatively.

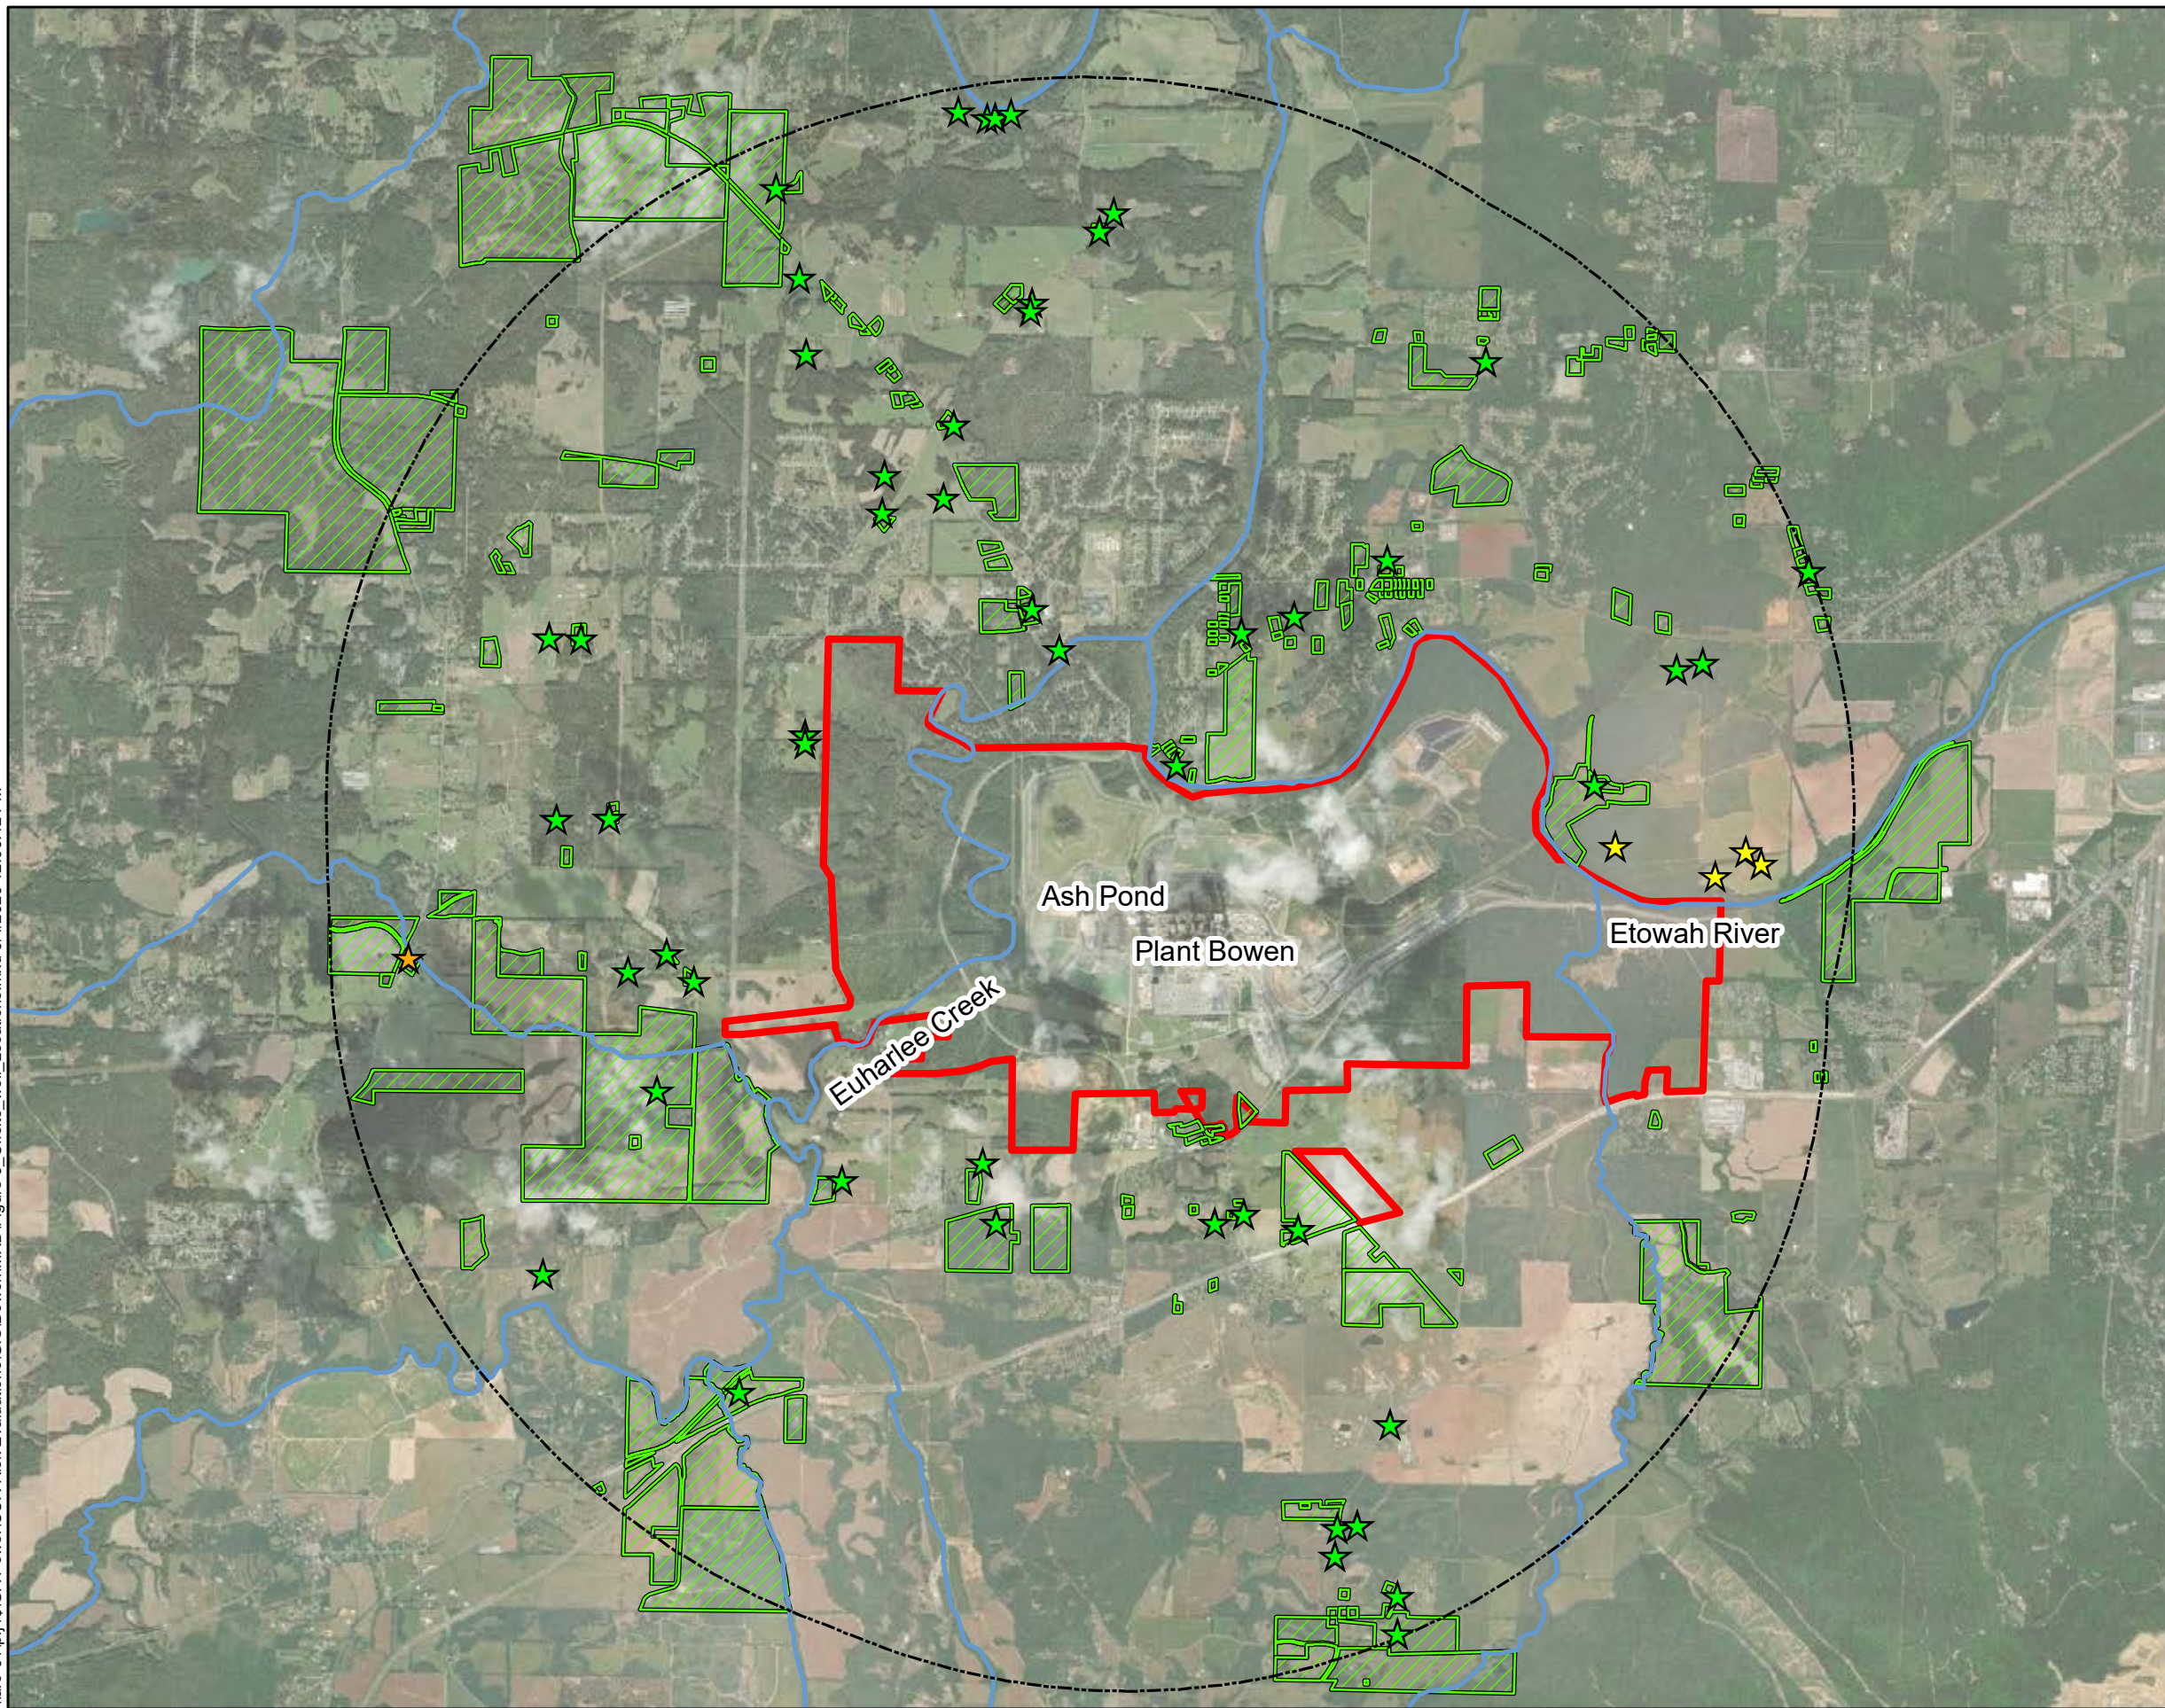

○ Indicates potentially complete pathway to receptors, which are evaluated qualitatively.

Footnotes

1. Industrial worker was considered to have no complete pathways because there are no wells on-site that are classified for use as potable wells. On-site construction workers would be expected to have little to no direct contact with on-site groundwater due to safety procedures outlined in their site-specific health and safety plans.
2. Off-site industrial/construction worker addressed through the evaluation of hypothetical off-site residential receptors as health-protective screening levels for residential receptors would be more conservative than industrial and construction worker screening levels.
3. Data from surface water samples collected in Euharlee Creek were used to evaluate hypothetical recreators in Euharlee Creek and the Etowah River downstream.
4. Generalized receptor for ecological health risk evaluation.

March 5, 2020

Introduction

Plant Bowen is located at 317 Covered Bridge Rd, Euharlee, GA 30120. Plant Bowen operates a Coal Combustion Residual (CCR) Ash Pond (AP-1) located to the west of the plant. NewFields conducted a well survey of potential drinking water wells within a three-mile radius of the AP-1 (“Investigated Area”). The Investigated Area is shown on Figure 1.

As part of this survey, NewFields reviewed information from a number of Federal, State, and County records and online sources, as well as two windshield surveys of the Investigated Area. Information from each identified well was then compiled into a geographic information system (GIS) database.

Information Collection

This section summarizes the sources utilized to identify potential drinking water wells within the Investigated Area.

1. Federal Sources

- a. **United States Geological Survey (USGS).** USGS maintains an inventory database of wells sampled by a USGS-affiliated program for groundwater levels and/or water quality parameters at any time in the past.¹ Well information and coordinates were downloaded for the state of Georgia and compiled into the GIS database. Wells in this database in the Investigated Area are labelled ‘human drinking water wells’ or ‘monitoring wells’. Many of the monitoring wells appear to be co-located with drinking water wells and may in fact be private drinking water wells utilized for monitoring purposes by USGS, and so were assumed to be likely drinking water wells in this survey. Some of these USGS monitoring wells may in fact be private drinking water wells utilized for monitoring purposes by USGS.
- b. **Safe Drinking Water Information System (SDWIS).** This EPA database has listings of public water systems but does not have well location information. SDWIS information was used to help identify the suppliers of public water in the vicinity of the facility. The primary supplier of water in the vicinity is the Bartow County Water Department.

2. State Sources

Georgia Environmental Protection Division (EPD)

- a. **Drinking Water Branch.** EPD Drinking Water Branch maintains records about municipal and industrial wells, whose presence or absence within a radius of a site can be ascertained by contacting the agency. An email was sent to Michael Gillis of EPD on October 23rd, 2019. Mr. Gillis confirmed there are no wells within the Investigated Area.
- b. **Georgia Geologic Survey Hydrologic Study.** In 1979, the Georgia Geologic Survey conducted a hydrologic study of Bartow, Cherokee, and Forsyth county to provide information to industries, counties, and land developers needed to develop new groundwater supplies as the counties grew. The survey located a representative sample of residential and farms wells to determine their depth and construction type. That survey identified several residential wells in the investigated area.

¹ <http://waterdata.usgs.gov/ga/nwis/inventory?introduction>

- c. **Hazardous Site Inventory (HSI) files.** EPD maintains files for Hazardous Site Inventory files for site which are undergoing state-led corrective action. These files usually contain groundwater data and well surveys. There are no HSI sites within the Investigated Area.
 - d. **Hazardous Site Response Act (HSRA) Notifications.** EPD maintains non-HSI HSRA notification reports (i.e., notifications submitted after releases of reportable substances). NewFields reviewed reports associated with sites in Bartow County and scanned well surveys done for sites within a 5-mile radius of Plant Bowen. No wells were identified in the Investigated Area.
3. County Sources
- a. **Bartow County Health Department.** The Health Department maintains records of the permits for "on-site sewage management systems" (septic tanks). However, Bartow County does not maintain these records in a manner that is geographically searchable and so no wells could be identified using this source.
 - b. **Bartow County Water Department.** The Water Department provided NewFields with a shapefile showing the waterlines in southwest Bartow County, including the dates of construction. Public water is available throughout the Investigated Area. Earliest lines in the area were built in 1972, and most later lines were built coinciding with new construction.
 - c. **Bartow County Tax Assessor.** Bartow County GIS Analyst Melissa McClain-Lasebikan provided parcel shapefiles, which were joined to WinGAP parcel data supplied by Carolyn E. Dew with the Bartow County Tax Assessor's office. The tax assessor's data included improvement values for parcels (indicating the presence of a structure) and the year of construction. Parcels with structures built prior to 1972 were identified as potentially containing active or abandoned drinking water wells.
4. Windshield Surveys
- a. A windshield survey of the Investigated Area was conducted on October 9th, 2019. During the survey wells were visually identified and compiled into the GIS database. The majority of wells identified during the survey were near residences and are most likely drinking water wells. Some apparent wells were observed in close proximity to agricultural irrigation and were assumed to be irrigation wells.

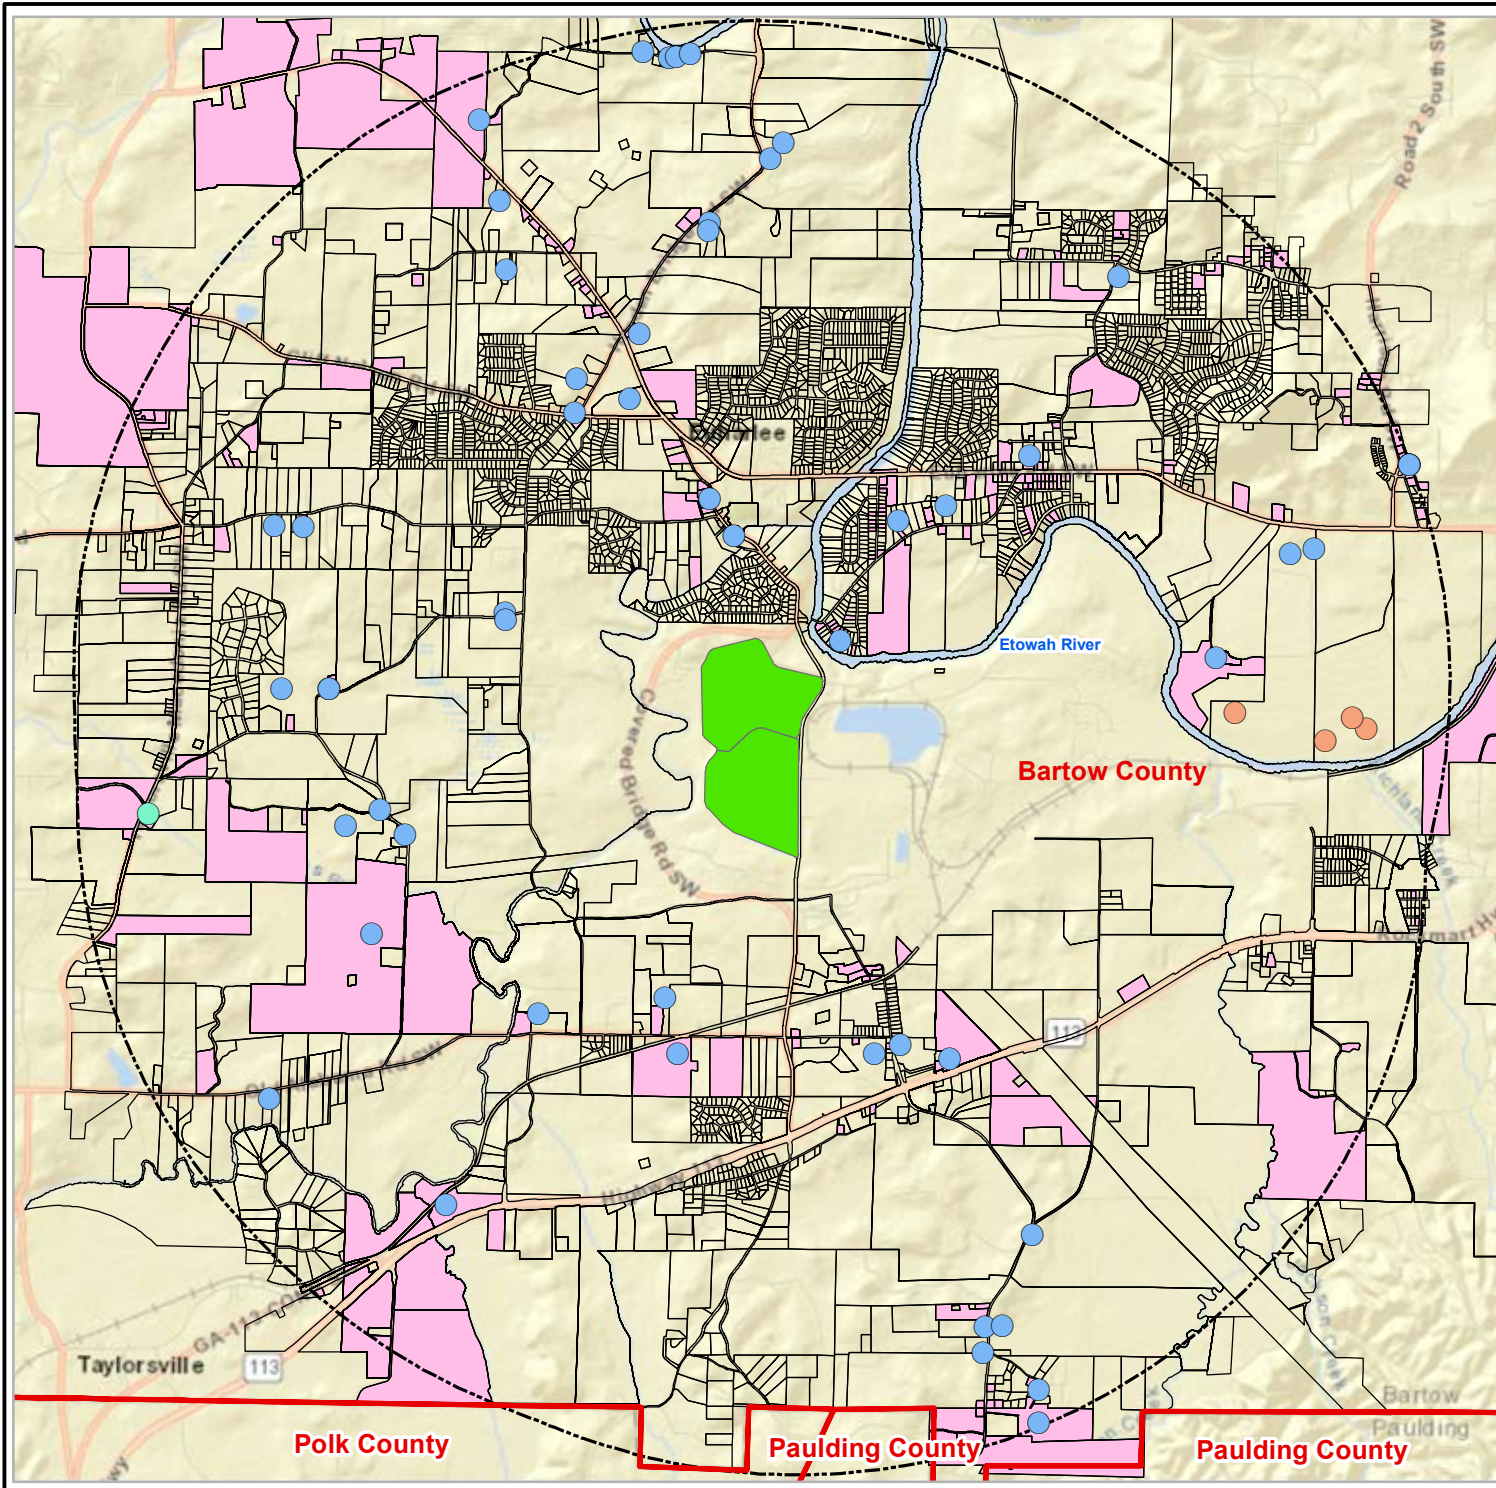

Summary

In addition to identifying specific wells from the above listed sources, NewFields used a combination of parcel data and information about the presence and age of public water infrastructure to identify parcels that most likely are using well water as their drinking water source or had drinking water wells at one time. Public water is available throughout the area. Parcels with structures older than the water lines were assumed to have a well. These wells may or may not be active for drinking water and/or irrigation. Parcels may be (or have been) sharing wells, so a well might not exist for each identified parcel.

Combining well data from all sources with parcel data, NewFields identified 218 parcels likely to be associated with an active or inactive well within the Investigated Area, and one parcel with a spring. The majority of these wells likely are likely private drinking water wells, but there are also some irrigation wells. There were no public drinking water wells with the Investigated Area.

Parcel data was used to identify 184 potential wells. Windshield surveys identified 27 potential wells. Sixteen (16) wells were identified using the GA DNR Hydrological Study. The USGS was used to identify eight wells and one spring. Many wells were identified by multiple sources.

Figure 1 shows points for identified wells. The shaded parcels on Figure 1 are parcels that were identified from parcel data as likely to contain wells. When viewed as a PDF file, the figure is interactive, and wells identified using different sources can be turned on and off.

General Statistics			
Total Number of Observations	7	Number of Distinct Observations	5
		Number of Missing Observations	0
Minimum	0.013	Mean	0.0169
Maximum	0.02	Median	0.017
SD	0.00254	Std. Error of Mean	9.6186E-4
Coefficient of Variation	0.151	Skewness	-0.0329

Note: Sample size is small (e.g., <10), if data are collected using ISM approach, you should use guidance provided in ITRC Tech Reg Guide on ISM (ITRC, 2012) to compute statistics of interest.

For example, you may want to use Chebyshev UCL to estimate EPC (ITRC, 2012).

Chebyshev UCL can be computed using the Nonparametric and All UCL Options of ProUCL 5.1

Normal GOF Test		Shapiro Wilk GOF Test	
Shapiro Wilk Test Statistic	0.932	Data appear Normal at 5% Significance Level

97.5% Chebyshev(Mean, Sd) UCL	0.0229	99% Chebyshev(Mean, Sd) UCL	0.0264

Suggested UCL to Use

95% Student's-t UCL	0.0187
---------------------	--------

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be reliable. Chen's and Johnson's methods provide adjustments for positively skewed data sets.

Mean (detects)	0.00671		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

SiREM Aquifer Solids Analytical Report

Certificate of Analysis
SiREMNA™ Parameters

Customer: Geosyntec Consultants Inc. **SiREM Reference:** S-6196 **Customer**
Project ID: Bowen ACM Evaluation **Final Report Issued:** 28 January 2021
Site Sampling Date: 13 and 14 August 2020

This report has been revised from the original issued on 12 November 2020 to include methodology descriptions.

INTRODUCTION

Geosyntec Consultants Inc. (Geosyntec) retained SiREM to perform SiREMNA™ testing including anion exchange capacity (AEC), cation exchange capacity (CEC), total sulfur, total sulfide, organic carbon content, total metals, X-Ray Diffraction (XRD) and Scanning Electron Microscopy (SEM) with Energy Dispersive X-Ray analysis (EDXA) from geologic materials collected at the Bowen ACM Site (the Site).

Site geologic materials were collected on 13 and 14 August 2020. SiREM received the samples on 21 September 2020 in good condition with a measured temperature of 15°C. Refer to Attachment A for Chain of Custody documentation received with the samples.

The site materials were stored at 4°C upon arrival until testing commenced. On 24 September 2020 geologic material samples were individually homogenized and subsampled in a chemical fume hood. The samples were shipped to external laboratories for analysis as outlined in the summary table below. Prior to performing the XRD analysis, SGS performed whole rock analysis on the samples to have as a reference for the mineral identification by XRD. Refer to Attachment B for the original external laboratory reports.

Method Summary Table

Parameter	Method	Laboratory
Total sulfur, total sulfide and organic carbon content	ASTM E1915-13	SGS, Lakefield, Ontario
Total metals	EPA 200.8	
Whole Rock Analysis	Borate Fusion and Xray Fluorescence Spectrometry	
XRD	Rietveld refinement method	
SEM and EDXA	SGS Internal method	
CEC	EPA method SW9081	SGS, Guelph, Ontario
AEC	modified EPA method SW9081	Specialty Analytical, Clackamas, Oregon

METHOD REFERENCES

ASTM W1915-13: Standard Test Methods for Analysis of Metal Bearing Ores and Related Materials for Carbon, Sulfur, and Acid-Base Characteristics

EPA 200.8: Determination of Trace Elements in Waters and Wastes by Inductively Coupled Plasma-Mass Spectrometry

The Rietveld Method of Mineral Identification by XRD (ME-LR-MIN-MET-MN-D05) is the method used by SGS and is accredited to the requirements of ISO/IEC 17025

Borate Fusion and Xray Fluorescence Spectrometry is the method used by SGS and is accredited to the requirements of ISO/IEC 17025

SEM-EDS analysis is conducted using the Tescan Vega II SEM which is equipped with an Oxford EDS detector

EPA 9081: Cation-Exchange Capacity of Soils (Sodium Acetate)

Modified EPA 9081: Anion-Exchange Capacity of Soils. Sodium nitrate used in place of sodium acetate to exchange anions, washed with isopropyl alcohol and nitrate extracted with sodium chloride. Nitrate analyzed by SM4500-NO₃-F.

	Minerals Geochemistry Lakefield Laboratory	Revision 2.7 Doc Type Method Summary Method No: GO/GC/GT_XR Code F76V Service Testing Issued Date 23/Sep/2014
Minerals	Preparation and Determination of Major Element Oxides, LOI and Rare Earth Oxides in Oxide Ores, and Process Control and Trade Products by Borate Fusion and Xray Fluorescence Spectrometry [SiO ₂ , Al ₂ O ₃ , Fe ₂ O ₃ , MgO, CaO, Na ₂ O, K ₂ O, P ₂ O ₅ , MnO, TiO ₂ , Cr ₂ O ₃ ; V ₂ O ₅ ; LOI; additions BaO; Ce ₂ O ₃ ; Nd ₂ O ₃ , La ₂ O ₃ ; Pr ₂ O ₃ , Sm ₂ O ₃ ; Nb ₂ O ₅ , ThO ₂ , Ta ₂ O ₅ ; SnO ₂ ; SrO; ZrO ₂ ; HfO ₂ ; Y ₂ O ₃ ; WO ₃ ; U ₃ O ₈ ; Co; Ni ; XRF]	Approved by K. Patel

1. Parameter(s) measured, unit(s):

Silicon Dioxide (SiO₂), Aluminum Oxide (Al₂O₃), Iron(III) Oxide (Fe₂O₃), Magnesium Oxide (MgO), Calcium Oxide (CaO), Sodium Oxide (Na₂O), Potassium Oxide (K₂O), Phosphorus Pentoxide (P₂O₅), Manganese Oxide (MnO), Titanium Dioxide (TiO₂), Chromium (III) Oxide (Cr₂O₃), Vanadium Oxide (V₂O₅), LOI, in %

Barium Oxide (BaO), Cerium (III) Oxide (Ce₂O₃), Neodymium Oxide (Nd₂O₃), Lanthanum Oxide (La₂O₃), Praseodymium Oxide (Pr₂O₃), Samarium Oxide (Sm₂O₃), Niobium Pentoxide (Nb₂O₅), Thorium Dioxide (ThO₂), Tantalum Pentoxide (Ta₂O₅), Tin Dioxide (SnO₂) Uranium Oxide (U₃O₈), Cobalt (Co), Nickel (Ni), Strontium Oxide (SrO), Zirconium Dioxide (ZrO₂), Hafnium Oxide (HfO₂), Yttrium Oxide (Y₂O₃), Tungsten Trioxide (WO₃) in % can be added as additions

2. Typical sample size:

0.2 to 0.5g, 1g additional for LOI analysis

3. Type of sample applicable (media):

Rocks, oxide ores, concentrates and catalysts

4. Sample preparation technique used:

Samples are crushed and pulverized according to client specified instructions or default preparation procedures. This method is used to report, in percentage, the whole rock suite (SiO₂, Al₂O₃, Fe₂O₃, MgO, CaO, Na₂O, K₂O, P₂O₅, MnO, TiO₂, Cr₂O₃, V₂O₅). Sample preparation entails the formation of a homogenous glass disk by the fusion of the sample and a lithium tetraborate/lithium metaborate mixture. The LOI is determined separately and gravimetrically at 1000°C.

5. Method of analysis used:

The prepared disks are analyzed by wavelength dispersion X-ray fluorescence (WD-XRF). The

LOI is included in the matrix correction calculations, which are performed by the XRF software.

6. Data reduction by:

Computer, on line, data fed to Laboratory Information Management System with secure audit trail.

7. Figures of Merit:

This method has been fully validated for the range of samples typically analyzed. Method validation includes the use of reference materials, replicates, duplicates and blanks to calculate accuracy, precision, linearity, range, limit of detection, reporting limit, specificity and measurement uncertainty.

The reporting limits has been determined according to the following

Element	Report Limit %
SiO ₂	0.01
Al ₂ O ₃	0.01
MgO	0.01
Na ₂ O	0.01
K ₂ O	0.01
CaO	0.01
P ₂ O ₅	0.01
TiO ₂	0.01
Cr ₂ O ₃	0.01
V ₂ O ₅	0.01
Fe ₂ O ₃	0.01
MnO	0.01
LOI	-10

*upper limit for all elements is 100%. A negative LOI indicates a gain on ignition

8. Quality control:

Quality control materials include method blanks, replicates and reference materials and are randomly inserted with the frequency set according to method protocols at ~12% for ore grade analysis and 18% for process control analysis. Quality control materials will also include BRM (Barren reference materials, or preparations blanks) and preparation duplicates if samples have been taken through the sample reduction process. Party quality samples are assayed in replicate, umpire quality samples are in triplicate. Calibration materials that cover the range upon method set-up; calibration check performed daily.

9. Accreditation:

The Standards Council of Canada has accredited this test in conformance with the requirements of ISO/IEC 17025. See www.scc.ca/en/search/palcan for scope of accreditation.

Note: Scopes of accreditation are site specific, please check with the local representative.

Quantitative X-Ray Diffraction by Rietveld Refinement

Report Prepared for: Environmental Services

Project Number/ LIMS No. Custom XRD/MI4504-OCT20

Sample Receipt: October 6, 2020

Sample Analysis: October 6, 2020

Reporting Date: October 26, 2020

Instrument: BRUKER AXS D8 Advance Diffractometer

Test Conditions: Co radiation, 35 kV, 40 mA
Regular Scanning: Step: 0.02°, Step time: 1s, 2θ range: 3-80°

Interpretations : PDF2/PDF4 powder diffraction databases issued by the International Center for Diffraction Data (ICDD). DiffracPlus Eva and Topas software.

Detection Limit : 0.5-2%. Strongly dependent on crystallinity.

Contents:

- 1) Method Summary
- 2) Quantitative XRD Results
- 3) XRD Pattern(s)

Kim Gibbs, H.B.Sc., P.Ge.
Senior Mineralogist

Huyun Zhou, Ph.D., P.Ge.
Senior Mineralogist

ACCREDITATION: SGS Minerals Services Lakefield is accredited to the requirements of ISO/IEC 17025 for specific tests as listed on our scope of accreditation, including geochemical, mineralogical and trade mineral tests. To view a list of the accredited methods, please visit the following website and search SGS Canada - Minerals Services - Lakefield: <http://palcan.scc.ca/SpecsSearch/GLSearchForm.do>.

Method Summary

The Rietveld Method of Mineral Identification by XRD (ME-LR-MIN-MET-MN-D05) method used by SGS Minerals Services is accredited to the requirements of ISO/IEC 17025.

Mineral Identification and Interpretation:

Mineral identification and interpretation involves matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

Quantitative Rietveld Analysis:

Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

DISCLAIMER: This document is issued by the Company under its General Conditions of Service accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted.

Summary of Rietveld Quantitative Analysis X-Ray Diffraction Results

Mineral/Compound	S-6196-1 OCT4504-01 (wt %)	S-6196-2 OCT4504-02 (wt %)	S-6196-3 OCT4504-03 (wt %)	S-6196-4 OCT4504-04 (wt %)	S-6196-5 OCT4504-05 (wt %)
Quartz	79.2	43.6	39.9	42.6	66.7
Albite	0.8	1.1	2.2	2.3	1.5
Microcline	2.3	-	-	-	-
Muscovite	11.1	14.0	13.7	20.1	21.6
Kaolinite	6.6	17.2	24.5	16.2	9.2
Goethite	-	10.4	17.5	14.8	-
Orthoclase	-	13.7	1.4	3.6	0.3
Magnetite	-	-	0.2	0.1	-
Rutile	-	-	0.6	0.4	0.7
TOTAL	100	100	100	100	100

Zero values indicate that the mineral was included in the refinement, but the calculated concentration is below a measurable value.

Dashes indicate that the mineral was not identified by the analyst and not included in the refinement calculation for the sample.

The weight percent quantities indicated have been normalized to a sum of 100%. The quantity of amorphous material has not been determined.

Mineral/Compound	Formula
Quartz	SiO ₂
Albite	NaAlSi ₃ O ₈
Microcline	KAlSi ₃ O ₈
Muscovite	KAl ₂ (AlSi ₃ O ₁₀)(OH) ₂
Kaolinite	Al ₂ Si ₂ O ₅ (OH) ₄
Goethite	αFeO·OH
Orthoclase	KAlSi ₃ O ₈
Magnetite	Fe ₃ O ₄
Rutile	TiO ₂

RE: S-6196

Dear Kela Ashworth:

Order No.: 2009183

Specialty Analytical received 5 sample(s) on 9/25/2020 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications, except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

A handwritten signature in black ink, appearing to read "M. French". The signature is fluid and cursive, written over a white background.

Marty French

KEY TO FLAGS

Rev. May 12, 2010

- A This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
- A1 This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
- A2 This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
- A3 The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
- A4 The product appears to be aged or degraded diesel.
- B The blank exhibited a positive result great than the reporting limit for this compound.
- CN See Case Narrative.
- D Result is based from a dilution.
- E Result exceeds the calibration range for this compound. The result should be considered as estimate.
- F The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
- G Result may be biased high due to biogenic interferences. Clean up is recommended.
- H Sample was analyzed outside recommended holding time.
- HT At clients request, samples was analyzed outside of recommended holding time.
- J The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
- K Diesel result is biased high due to amount of Oil contained in the sample.
- L Diesel result is biased high due to amount of Gasoline contained in the sample.
- M Oil result is biased high due to amount of Diesel contained in the sample.
- MC Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
- MI Result is outside control limits due to matrix interference.
- MSA Value determined by Method of Standard Addition.
- O Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
- Q Detection levels elevated due to sample matrix.
- R RPD control limits were exceeded.
- RF Duplicate failed due to result being at or near the method-reporting limit.
- RP Matrix spike values exceed established QC limits; post digestion spike is in control.
- S Recovery is outside control limits.
- SC Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
- * The result for this parameter was greater than the maximum contaminant level of the TCLP regulatory limit.

RE: Project: PLANT BOWEN CCR
Pace Project No.: 2629383

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 21, 2020 and February 28, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: PLANT BOWEN CCR

Pace Project No.: 2629383

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

H1 Analysis conducted outside the EPA method holding time.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

R1 RPD value was outside control limits.

Atlanta, GA 30339

RE: Project: 2629383
Pace Project No.: 30351718

Dear Mr. Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between February 25, 2020 and March 03, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins
jacquelyn.collins@pacelabs.com

QUALIFIERS

Project: 2629383
Pace Project No.: 30351718

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: BOWEN AP-1 1ST SEMIANNUAL
Pace Project No.: 2630325

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between March 20, 2020 and March 27, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: BOWEN AP-1 1ST SEMIANNUAL

Pace Project No.: 2630325

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B Analyte was detected in the associated method blank.

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: 2630325
Pace Project No.: 30356179

Dear Kevin Herring:

Enclosed are the analytical results for sample(s) received by the laboratory between March 24, 2020 and March 31, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

Revision 1 - This report replaces the April 21, 2020 report. This project was revised on June 25, 2020 in order to report re-counted results for 6 samples as per client request. (Greensburg, PA)

Revision 2 - This report replaces the June 25, 2020 report. This project was revised on June 26, 2020 to include all results for samples as per client request. (Greensburg, PA)

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins
jacquelyn.collins@pacelabs.com

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

PROJECT NARRATIVE

Project: 2630325
Pace Project No.: 30356179

Date: June 26, 2020

Ra-228 false positives were attributed to radon present on 6 samples during initial counts. Samples were re-ingrowthed, re-counted and reported on this reissued report.

REPORT OF LABORATORY ANALYSIS

This report shall not be reproduced, except in full,
without the written consent of Pace Analytical Services, LLC.

PROJECT NARRATIVE

Project: 2630325
Pace Project No.: 30356179

Method: EPA 9315
Description: 9315 Total Radium
Client: PACE ANALYTICAL SERVICES LLC-Atlanta, GA
Date: June 26, 2020

General Information:

40 samples were analyzed for EPA 9315 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

PROJECT NARRATIVE

Project: 2630325
Pace Project No.: 30356179

Method: EPA 9320
Description: 9320 Radium 228
Client: PACE ANALYTICAL SERVICES LLC-Atlanta, GA
Date: June 26, 2020

General Information:

40 samples were analyzed for EPA 9320 by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

PROJECT NARRATIVE

Project: 2630325
Pace Project No.: 30356179

Method: Total Radium Calculation
Description: Total Radium 228+226
Client: PACE ANALYTICAL SERVICES LLC-Atlanta, GA
Date: June 26, 2020

General Information:

40 samples were analyzed for Total Radium Calculation by Pace Analytical Services Greensburg. All samples were received in acceptable condition with any exceptions noted below or on the chain-of custody and/or the sample condition upon receipt form (SCUR) attached at the end of this report.

Hold Time:

The samples were analyzed within the method required hold times with any exceptions noted below.

Method Blank:

All analytes were below the report limit in the method blank, where applicable, with any exceptions noted below.

Laboratory Control Spike:

All laboratory control spike compounds were within QC limits with any exceptions noted below.

Matrix Spikes:

All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted below.

Additional Comments:

This data package has been reviewed for quality and completeness and is approved for release.

QUALIFIERS

Project: 2630325
Pace Project No.: 30356179

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

WORKORDER QUALIFIERS

WO: 30356179

[1] Ra-228 false positives were attributed to radon present on 6 samples during initial counts. Samples were re-ingrowth, re-counted and reported on this reissued report.

RE: Project: Plant Bowen
Pace Project No.: 2630600

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on March 31, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring
kevin.herring@pacelabs.com

QUALIFIERS

Project: Plant Bowen

Pace Project No.: 2630600

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

RE: Project: PLANT BOWEN AP SCAN
Pace Project No.: 2631760

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 11, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: PLANT BOWEN AP SCAN

Pace Project No.: 2631760

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

D6 The precision between the sample and sample duplicate exceeded laboratory control limits.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

RE: Project: Plant Bowen App III & Mo
Pace Project No.: 92476365

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 06, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Charlotte

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant Bowen App III & Mo

Pace Project No.: 92476365

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: PLANT BOWEN AP SCAN
Pace Project No.: 2632072

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 20, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: PLANT BOWEN AP SCAN

Pace Project No.: 2632072

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: Plant Bowen AP Scan
Pace Project No.: 2632196

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 22, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Asheville
- Pace Analytical Services - Atlanta, GA

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

QUALIFIERS

Project: Plant Bowen AP Scan

Pace Project No.: 2632196

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: 2632196 Georgia Power
Pace Project No.: 30365061

Dear Mr. Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 27, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins

QUALIFIERS

Project: 2632196 Georgia Power

Pace Project No.: 30365061

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

QUALIFIERS

Project: Plant Bowen AP Scan

Pace Project No.: 2632194

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

M6 Matrix spike and Matrix spike duplicate recovery not evaluated against control limits due to sample dilution.

RE: Project: 2632194 Georgia Power
Pace Project No.: 30365063

Dear Mr. Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 27, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins

QUALIFIERS

Project: 2632194 Georgia Power
Pace Project No.: 30365063

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: For Safe Drinking Water Act (SDWA) analyses, the reported Unc. is the calculated Count Uncertainty (95% confidence interval) using a coverage factor of 1.96. For all other matrices (non-SDWA), the reported Unc. is the calculated Expanded Uncertainty (aka Combined Standard Uncertainty, CSU), reported at the 95% confidence interval using a coverage factor of 1.96.

Gamma Spec: The Unc. reported for all gamma-spectroscopy analyses (EPA 901.1), is the calculated Expanded Uncertainty (CSU) at the 95.4% confidence interval, using a coverage factor of 2.0.

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

QUALIFIERS

Project: Plant Bowen AP Scan

Pace Project No.: 2632218

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Atlanta, GA 30339

RE: Project: 2632218/Georgia Power
Pace Project No.: 30365324

Dear Mr. Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on May 28, 2020. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jacquelyn Collins

QUALIFIERS

Project: 2632218/Georgia Power
Pace Project No.: 30365324

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.
