GROUNDWATER STATS CONSULTING

August 26, 2020

Southern Company Services
Attn: Ms. Lauren Petty
3535 Colonnade Parkway
Birmingham, AL 35243

Re: Plant Bowen Landfill Cells 9 & 10
March 2020 Event - Statistical Analysis

Dear Ms. Petty,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater quality for the March 2020 sample event for Georgia Power Company's Plant Bowen Landfill Cells 9 & 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

The monitoring well network, as provided by Southern Company Services, consists of the following:

Bedrock Wells:

- **Upgradient:** GWA-39RZ, GWA-41R, GWA-43R
- **Downgradient:** GWC-45R, GWC-46R, GWC-47R, GWC-49R

Overburden Wells:

- **Upgradient:** GWA-39Z, GWA-40, GWA-41, GWA-42, GWA-43
- **Downgradient:** GWC-44, GWC-45, GWC-47, GWC-48, GWC-49Z

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% nondetects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves are provided to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Constituents:

Bedrock Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan – (all parameters)
- # Constituents: 16
- # Downgradient wells: 4

Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan (all parameters)
- # Constituents: 15 (Silver is not included because it is 100% nondetect in all overburden wells.)
- # Downgradient wells: 5

CCR Appendix III Constituents:

Bedrock & Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (calcium, chloride, sulfate, TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, fluoride, pH)
- # Constituents: 7
- # Downgradient wells: 9

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean

and standard deviation of the historical concentrations to account for concentrations below the reporting limit.

- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Background Screening Summary Georgia EPD Constituents – Conducted in August 2019

Outlier and Trend Testing – Bedrock & Overburden Wells

Time series plots are used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of those findings were submitted with the screening report and a summary of the flagged values follows this letter (Figure C).

Using the Tukey box plot method, several outliers were identified. For information purposes, when the most recent values are identified as outliers, values are not flagged in the database at this time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Of the outliers identified by Tukey's method, several values were flagged as such in the database. When the test identified values that were similar to other measurements within a given well or neighboring wells or were reported nondetects, these values were not flagged. All values flagged in the database as outliers are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections, and the results of those findings were submitted with the screening report.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. The trend analyses results were submitted with the screening report.

Statistically significant decreasing trends were noted for barium in Bedrock wells GWC-47R and GWC-49R, and in Overburden well GWC-49Z. No adjustments were required to these records because the magnitudes of these trends are low relative to the average concentrations at these wells. In the future, if adjustments are made to any records, a summary will be provided with the report.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells

and the results were submitted with the screening report. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

For the Bedrock wells, the ANOVA identified significant differences among upgradient well data for barium. No significant differences were noted for antimony, arsenic, beryllium, chromium, cobalt, copper, lead, mercury, nickel, thallium, vanadium, and zinc. The ANOVA could not test cadmium, selenium, and silver as there was no variation in the measurements among the upgradient wells.

For the Overburden wells, the ANOVA identified significant differences among upgradient well data for: antimony, barium, cadmium, and cobalt. No significant differences were noted for arsenic, chromium, copper, lead, mercury, nickel, thallium, and zinc. The ANOVA could not test beryllium, selenium, silver, and vanadium as there was no variation in the measurements among the upgradient wells.

Where variation is identified, the intrawell method is generally recommended as the most powerful statistical method providing groundwater quality is presumed to be unimpacted by practices at the facility in downgradient wells. Where variation is not identified, this suggests that interwell analysis would be considered for the statistical method for these constituents. However, because this is a lined landfill with pre-waste data showing that metals occur naturally in low level concentrations, and no records required any adjustments due to statistically significant increasing trends in data sets, intrawell methods are recommended as the primary statistical method for all detected well/constituent pairs.

Establishing Statistical Limits

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from

across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed concentrations upgradient for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-3 resample plan, are constructed using all available data within each well with detections through September 2018. Compliance data are compared to these intrawell background limits during each subsequent semi-annual sampling event. As previously discussed, no statistical analyses were included for well/constituent pairs where there are 100% nondetects in the downgradient well.

In the event of an initial exceedance of compliance well data, the 1-of-3 resample plan allows for collection of two additional samples to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary.

Background Update Summary – March 2020

Prior to updating background data in March 2020, Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used for all wells for the intrawell parameters and for only the upgradient wells for the interwell parameters. Tukey's test noted several potential outliers in downgradient wells for intrawell parameters, but these values were not flagged as they appeared to be representative of natural variation. Although not noted on Tukey's test, a high value for sulfate in downgradient well GWC-44 was flagged as an outlier to construct statistical limits that are conservative from a regulatory perspective. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter (Figure C).

For constituents requiring intrawell prediction limits (calcium, chloride, sulfate, and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through July 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The results of the Mann-Whitney test were submitted with the screening. Statistically significant differences were found between the two groups for the following well/constituent pairs: calcium in upgradient well GWA-43 and downgradient well GWC-49Z; chloride in downgradient well GWC-46R; sulfate in upgradient wells GWA-40 and GWA-43, and downgradient well GWC-49R; and TDS in upgradient well GWA-39Z.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. In studies such as the current one, in which one or both of the segments being compared are short, the comparison is complicated by the fact that normal short-term variation may be mistaken for a long-term change in medians. In this analysis all of the cases with statistically significant Mann-Whitney results were updated. The individual cases are discussed below.

For chloride in downgradient well GWC-46R, the newer data had only a slightly lower median, and reported measurements were similar to those observed earlier in the record. For calcium in downgradient well GWA-43 and upgradient well GWC-49Z and sulfate in upgradient well GWA-43, the newer, lower concentrations are very similar to those in the later portion of the historical data segments.

Although sulfate in well GWA-40 and TDS in well GWA-39Z showed increases in median concentrations, these are upgradient wells which reflect natural variation in groundwater unrelated to the facility. Additionally, the patterns and concentrations are similar to those in other upgradient wells. An increase in median concentrations was also noted for sulfate in downgradient well GWC-49R, but the magnitude of the increase is minimal relative to the variation in other wells for sulfate.

For calcium, chloride, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data within each well through September 2019. Future compliance observations at each well are compared to these background limits during each subsequent semi-annual sampling event.

For boron, fluoride, and pH, which are evaluated using interwell prediction limits, the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable over time. No statistically significant increasing trends were noted; however, statistically significant decreasing trends were noted for boron in wells GWA-41R, GWA-43R, and GWA-39RZ, and pH in wells GWA-41R and GWA-43. The apparent decreasing trends in boron are exaggerated by high nondetect values early in the record. Since the other trends were of short duration and relatively low in magnitude with concentrations similar to those in neighboring upgradient wells, no adjustments were necessary. However, if these trends persist, particularly the decreasing trend in pH at GWA-43, the background period may need to be adjusted to provide representative interwell limits. The trend tests results were included with the screening.

All background data sets for the constituents listed above were updated using all available data from upgradient wells through September 2019. The interwell prediction limits are to be used to evaluate future compliance samples for the above constituents at each downgradient well.

Statistical Analysis of Georgia EPD Constituents – March 2020 Sample Event

Intrawell prediction limits, combined with a 1-of-3 resample plan for Bedrock and Overburden wells were constructed separately using all available data within each well with detections through September 2018 (Figures D and E, respectively). Compliance data are compared to these intrawell background limits during each subsequent semi-annual sampling event. As previously discussed, no statistical analyses were included for well/constituent pairs with 100% nondetects.

In the event of an initial exceedance of compliance well data, the 1-of-3 plan allows collection of up to two samples. When both resamples confirm the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. The following prediction limit exceedances were noted:

Bedrock

- Antimony: Upgradient well GWA-41R
- Barium: Downgradient well GWC-49R
- Zinc: Downgradient well GWC-47R

Overburden

- Chromium: Upgradient wells GWA-39Z and GWA-41
- Nickel: Upgradient well GWA-39Z
- Zinc: Downgradient well GWC-47

When exceedances are noted upgradient of the facility, it is generally an indication that groundwater quality is beginning to change naturally. Summaries of the Georgia EPD prediction limits follow this report.

When prediction limit exceedances occur, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are also included in the trend analyses along with downgradient to identify whether similar patterns exist upgradient of the site which is an indication of natural variability in groundwater unrelated to practices at the site. No statistically significant trends were present in any of the well/constituent pairs. A summary of the trend test results for the Bedrock and Overburden wells follows this letter (Figures F and G, respectively).

Statistical Analysis of Appendix III Parameters – March 2020 Sample Event

For calcium, chloride, sulfate and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2019 (Figure H). The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. Exceedances were noted for the following:

- Calcium: Upgradient wells GWA-40 and GWA-42; Downgradient well GWC-45R
- Chloride and Sulfate: Downgradient well GWC-45R
- TDS: Upgradient well GWA-41R; Downgradient wells GWC-45, GWC-45R and GWC-48

For boron, fluoride and pH, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through March 2020 (Figure I). The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. Exceedances were noted for the following:

- pH (upper limit): Downgradient well GWC-49R
- pH (lower limit): Downgradient wells GWC-44, GWC-45 and GWC-48

Data from well/constituent pairs found to exceed their respective prediction limits were further evaluated using the Sen's Slope/Mann Kendall trend test. Upgradient wells were included for any constituents requiring trend tests in downgradient wells (Figure J). No statistically significant increasing or decreasing trends were noted in any of the downgradient wells. A statistically significant increasing trend was noted in upgradient well GWA-42 for calcium, and statistically significant decreasing trends were noted for the following parameters in upgradient wells: calcium in well GWA-43; chloride in well GWA-39Z; pH in wells GWA-41R and GWA-43; and sulfate in wells GWA-39Z and GWA-43.

Summary

The following intrawell prediction limit exceedances were noted for the Georgia EPD parameters:

Bedrock

- Antimony: Upgradient well GWA-41R
- Barium: Downgradient well GWC-49R
- Zinc: Downgradient well GWC-47R

Overburden

- Chromium: Upgradient wells GWA-39Z and GWA-41
- Nickel: Upgradient well GWA-39Z
- Zinc: Downgradient well GWC-47

The following prediction limit exceedances were noted for the CCR parameters:

Intrawell Prediction Limits

- Calcium: Upgradient wells GWA-40 and GWA-42 and downgradient well GWC-45R
- Chloride: Downgradient well GWC-45R
- Sulfate: Downgradient well GWC-45R
- Total Dissolved Solids: Upgradient well GWA-41R, Downgradient Wells GWC-45, GWC-45R, GWC-48

Interwell Prediction Limits

- pH (upper limit): Downgradient well GWC-49R
- pH (lower limit): Downgradient wells GWC-44, GWC-45 and GWC-48

No statistically significant increasing trends were noted for any of the prediction limit exceedances identified at downgradient wells.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill at Cells 9 & 10. If you have any questions or comments, please feel free to contact us.

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 11 background values. 45.45% NDs. Well-constituent pair annual alpha = 0.005605. Individual comparison alpha = 0.002806 (1 of 3).

Constituent: Antimony Analysis Run 4/17/2020 7:05 AM View: Overburden Wells
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Within Limit

Prediction Limit
Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 11 background values. 90.91% NDs. Well-constituent pair annual alpha = 0.005605. Individual comparison alpha = 0.002806 (1 of 3).

Constituent: Antimony Analysis Run 4/17/2020 7:05 AM View: Overburden Wells

Within Limit

Prediction Limit
 Interwell Non-parametric

Limit = 0.04

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 112 background values. 62.5% NDs. Annual per-constituent alpha = 0.002838. Individual comparison alpha = 0.0001579 (1 of 2). Comparing 9 points to limit.

Constituent: Boron Analysis Run 4/17/2020 10:19 AM View: CCR PL's Interwell
 Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Within Limit

Prediction Limit
 Interwell Non-parametric

Limit = 0.3

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 112 background values. 54.46% NDs. Annual per-constituent alpha = 0.002838. Individual comparison alpha = 0.0001579 (1 of 2). Comparing 9 points to limit.

Constituent: Fluoride Analysis Run 4/17/2020 10:19 AM View: CCR PL's Interwell
 Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Exceeds Limits: GWC-44, GWC-45, GWC-48, GWC-49R

Prediction Limit
 Interwell Non-parametric

Limit = 7.89

Limit = 5.5

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 117 background values. Annual per-constituent alpha = 0.005156. Individual comparison alpha = 0.0002868 (1 of 2). Comparing 9 points to limit.

GROUNDWATER STATS CONSULTING

January 25, 2021

Southern Company Services
Attn: Ms. Lauren Petty
3535 Colonnade Parkway
Birmingham, AL 35243

Re: Plant Bowen Landfill Cells 1 & 2 - Bedrock and Overburden Wells
September 2020 Event - Statistical Analysis

Dear Ms. Petty,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater quality for the September 2020 sample event for Georgia Power Company's Plant Bowen Landfill Cells 1 & 2. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

Bedrock Wells:

- **Upgradient wells:** GWA-1, GWA-2, GWA-2R, GWA-4RZ, and GWA-50R
- **Downgradient wells:** GWC-6RZ, GWC-8RR, GWC-10R, GWC-11R, GWC-13RZ, and GWC-15R

Overburden Wells:

- **Upgradient wells:** GWA-3 and GWA-50
- **Downgradient wells:** GWC-5, GWC-6, GWC-7Z, GWC-8Z, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14Z, and GWC-15Z

Note that well GWA-3 was not sampled in September 2020.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance.

The following constituents are evaluated:

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium and zinc

Note that the terms “parameters” and “constituents” are interchangeable throughout this report. When there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% nondetects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

Due to varying detection limits in background data sets, a substitution of the most recent reporting limit is used for all nondetects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. A single reporting limit substitution is used across all wells in the time series plots for a given parameter since the wells are plotted as a group. In the case of zinc, the reporting limit increased from 0.01 mg/L to 0.02 mg/L and lead to small changes in statistical limits for the following wells:

- GWA-50, GWC-10, GWC-11, GWC-13, GWC-14Z, GWC-15Z, GWC-5, GWC-6, GWC-8Z, and GWC-9

For cadmium and cobalt, reporting limits of 0.001 mg/L and 0.01 mg/L respectively were substituted to be consistent with previous analyses. Values were re-assessed for outliers in this analysis and a summary of flagged outliers follows this report (Figure C). Changes in outliers did not result in any changes in statistically significant exceedances of prediction limits.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided during the previous screenings to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Constituents:

Bedrock Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all 16 parameters)
- # Constituents: 16
- # Downgradient wells: 6

Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan (all 16 parameters)
- # Constituents: 16
- # Downgradient wells: 11

CCR Appendix III Constituents:

Bedrock & Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (calcium, sulfate, TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, chloride, fluoride, pH)

- # Constituents: 7
- # Downgradient wells: 17

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects.
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 or 1-of-3 resample plans, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from natural variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. The 1-of-3 plan allows collection of up to two samples. A statistically significant increase is not declared unless all resamples also exceed the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resamples confirm the initial exceedance, further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that

an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural variation rather than a result of impact to groundwater quality downgradient of the facility.

Background Screening Summary Georgia EPD Constituents – Conducted in August 2019

Outlier and Trend Testing – Bedrock & Overburden Wells

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of those findings were submitted with the screening report and a summary of the flagged values follows this letter.

For Bedrock and Overburden wells, the Tukey box plot method identified several outliers. When the most recent values were identified as outliers, values were not flagged in the database (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers. Due to changing reporting limits for many constituents, when the nondetects were replaced with the most recent reporting limit, previously flagged "J" values (or estimated values) required flagging as outliers because they were much higher than current reporting limits.

Of the outliers identified by Tukey's method, several values were flagged in the database, and the remaining values were similar to other measurements within a given well or neighboring wells or were reported nondetects. Several other values were flagged in addition to those identified by Tukey's because the values were higher than all remaining concentrations and would cause the statistical limits to be elevated.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections. The results of those findings were submitted with the screening report.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. A summary of the trend analyses was included in the background screening.

Several statistically significant decreasing trends were noted. No statistically significant increasing trends were identified except for barium in 3 bedrock wells and in 1 overburden well. The magnitudes of the majority of these trends were low relative to the average concentrations and, therefore, required no adjustments to the records. For the following Bedrock well/constituent pairs, however, adjustments were required for statistically significant decreasing trending data in order to minimize the variance within each well and utilize more recent data that do not contain trends and that are representative of present-day groundwater quality conditions: chromium in well GWC-11R; and copper and nickel in upgradient well GWA-50R.

Note that, due to more recent higher measurements that are elevated above those observed in the upgradient well data, it is recommended that the trend test be used in lieu of prediction limits for barium at well GWC-13RZ. If research shows that these

concentrations are representative of natural spatial variation rather than resulting from the unit, intrawell prediction limits may be used to statistically analyze future compliance observations. A summary of the background data ranges used for these special cases follows this letter.

Determination of Spatial Variation – Bedrock & Overburden

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. A summary of the findings was submitted with the screening report.

For Bedrock wells, the ANOVA identified variation among upgradient well data for: antimony, arsenic, barium, chromium, lead, nickel, selenium and silver. No variation was identified for beryllium, cadmium, cobalt, copper, mercury, thallium, vanadium and zinc.

For Overburden wells, the ANOVA identified variation among upgradient well data for: barium, cobalt, copper, nickel, silver and zinc. The ANOVA did not identify variation for cadmium, chromium, lead, mercury and vanadium. The ANOVA could not test the following constituents because the data had no variation among the upgradient wells: arsenic, thallium, beryllium and selenium.

Where variation is not identified, this suggests that interwell analysis would be the most appropriate statistical method for these constituents. However, because this is a lined landfill with pre-waste data showing that metals occur naturally in low level detections, and no records required adjustments due to increasing trends, intrawell methods are recommended as the primary statistical method for all detected well/constituent pairs.

Background Update CCR Appendix III Constituents – Conducted in March 2020

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used for all wells for the intrawell parameters and for only the upgradient wells for the interwell parameters. The results of

this test were submitted with the screening report. High values for fluoride were noted through visual screening for wells GWA-2 and GWC-14Z. Of these two values, only the high value in well GWA-2 was flagged because of its impact on statistical limits. This value is included in a separate table for Excluded Data - Appendix III. Although Tukey's test noted several potential outliers in downgradient wells for intrawell parameters, these values were not flagged as they appeared to be representative of natural variation. As mentioned above, any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. Summary tables of all flagged values follow this report.

For constituents requiring intrawell prediction limits (calcium, sulfate and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Statistically significant differences were found between the two groups for the well/constituent pairs for calcium in upgradient well GWA-3, and sulfate in upgradient well GWA-3 and downgradient wells GWC-15R, GWC-5, and GWC-8Z.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background are not updated to include the newer data unless it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. The following cases with statistically significant Mann-Whitney results were updated because the newer data had a lower median or the newer data were similar in concentration to portions of the historical data: calcium in well GWA-3 and sulfate in wells GWA-3, GWC-5, and GWC-8Z.

Although sulfate in well GWC-15R showed an increase in the median concentration, the magnitude of the increase is minimal relative to concentrations in other wells. The background was, therefore, updated with newer data. The results of the Mann-Whitney test were submitted with the screening report.

Evaluation of Georgia EPD Constituents – September 2020

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from

across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed concentrations upgradient for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-3 resample plan for Overburden wells and a 1-of-2 resample plan for Bedrock wells, were constructed using all available data, except for the cases mentioned above, within each well with detections through September 2018 (Figures D and E, respectively). Future compliance data will be compared to these intrawell background limits during each subsequent semi-annual sampling event. As previously discussed, no statistical analyses were included for well/constituent pairs with 100% nondetects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. The 1-of-3 plan allows collection of up to two samples. When all resamples confirm the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. No exceedance was identified for Overburden wells, however, the following well/constituent pairs had compliance values higher than their respective prediction limits. These were not identified as exceedances because the compliance values were non-detect values based on the reporting limit:

- Arsenic: GWC-7Z
- Nickel: GWC-7Z
- Zinc: GWA-50 (upgradient), GWC-9, and GWC-13

Similar non-detect values were not identified as exceedances despite being higher than the respective well/constituent pair prediction limit for the following Bedrock well/constituent pairs:

- Zinc: GWA-1 (upgradient), GWC-6RZ, and GWC-13RZ

An exceedance was noted for the following downgradient Bedrock well/constituent pair:

- Antimony: GWC-11R

The reported measurement of 0.0053 mg/L for antimony in well GWC-11R exceeded its intrawell prediction limit of 0.0044 mg/L. Following the two-step analysis procedure, an interwell prediction limit was then constructed using pooled upgradient well data to evaluate the apparent intrawell prediction limit exceedance (Figure F). The reported measurement of antimony in this well was within the interwell prediction limit of 0.0097 mg/L. Therefore, no statistically significant increase (SSI) is identified, and no further action is necessary.

A statistical exceedance was noted for barium in upgradient Bedrock well GWA-4RZ. Exceedances in upgradient wells are an indication of natural changes in groundwater quality. Summaries of the Georgia EPD prediction limits follow this report.

When an initial exceedance occurs in a downgradient well (i.e. antimony at well GWC-11R), the exceedance is further evaluated using the Sen's Slope/Mann Kendall trend test, whether or not the exceedance is confirmed as an SSI by the follow-up interwell test. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. No statistically significant trends for antimony were found. Based on the recommendation of previous screenings, a Sen's Slope/Mann-Kendall trend test was used in lieu of a prediction limit for barium in well GWC-13RZ and identified a statistically significant increasing trend. That trend test, along with trend tests for upgradient wells, is included with the trend test results for prediction limit exceedances for Georgia EPD parameters (Figure G).

Evaluation of Appendix III Parameters – September 2020

For calcium, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2019. Results and a summary table are presented in Figure H. The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. No exceedances were identified.

For boron, chloride, fluoride, and pH, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through March 2020. Results and a summary table are presented in Figure I. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background

limit to determine whether there are exceedances over background. Exceedances were identified for the following well/constituent pairs:

- Chloride: GWC-13RZ
- Upper limit pH: GWC-10R, GWC-11R, and GWC-8RR

Note that when rounded, the upper limit for pH of 7.65 in well GWC-10R equals the observed value of 7.7.

Data from downgradient well/constituent pairs found to exceed their respective prediction limits were further evaluated using the Sen's Slope/Mann Kendall trend test along with upgradient wells for the same constituents (Figure J). A summary of the trend test results follows this letter. No statistically significant increasing trends were identified, but statistically significant decreasing trends were noted for the following well/constituent pairs:

- pH: GWA-3 (upgradient) and GWC-11R

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill Cells 1 & 2. If you have any questions or comments, please feel free to contact us.

Within Limit

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 149 background values. 71.14% NDs. Annual per-constituent alpha = 0.00107. Individual comparison alpha = 0.00008924 (1 of 2). Assumes 5 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 104 background values. 69.23% NDs. Annual per-constituent alpha = 0.006095. Individual comparison alpha = 0.0001798 (1 of 2). Comparing 17 points to limit.

Constituent: Boron Analysis Run 11/3/2020 3:34 PM View: App III - Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Exceeds Limit: GWC-13RZ

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 104 background values. 5.769% NDs. Annual per-constituent alpha = 0.006095. Individual comparison alpha = 0.0001798 (1 of 2). Comparing 17 points to limit.

Constituent: Chloride Analysis Run 11/3/2020 3:34 PM View: App III - Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 103 background values. 52.43% NDs. Annual per-constituent alpha = 0.006192. Individual comparison alpha = 0.0001827 (1 of 2). Comparing 17 points to limit.

Constituent: Fluoride Analysis Run 11/3/2020 3:34 PM View: App III - Interwell
Plant Bowen Client: Southern Company Data: Bowen 1&2 CCR

Exceeds Limits: GWC-10R, GWC-11R, GWC-8RR

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 105 background values. Annual per-constituent alpha = 0.012. Individual comparison alpha = 0.0003539 (1 of 2). Comparing 17 points to limit.

Re: Plant Bowen Landfill Cells 3 & 4
September 2020 Event – Statistical Analysis

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater quality for the September 2020 sample event for Georgia Power Company's Plant Bowen Landfill Cells 3 & 4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Downgradient:** GWC-16R, GWC-17R, GWC-18, GWC-18R, GWC-19R, GWC-20R, GWC-21R, GWC-22R, GWC-23R, GWC-24R, GWC-25R
- **Upgradient:** GWA-36, GWA-36R, GWA-37, GWA-38, GWA-51RZ, GWA-52, GWA-53, GWA-53R, GWA-54, GWA-55, GWA-55R, GWA-56

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance.

The constituents listed below are evaluated in this report. The terms "parameters" and "constituents" are interchangeable.

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% nondetects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

For the cases listed below, the most recent reporting limit is lower than historical reporting limits and is, therefore, substituted for nondetects in the record:

- TDS in well GWA-37 – reporting limit decreased from <34 mg/L to <10 mg/L;
- Cadmium in wells GWA-37, GWA-38, GWA-18, GWC-21R, GWC-22R, GWC-25R - reporting limit decreased from <0.01 mg/L to <0.0025 mg/L;
- Cobalt in wells GWA-36, GWA-37, GWA-54, GWA-55, GWC-36R, GWC-51R, GWC-18R, GWC-25R - reporting limit decreased from <0.01 mg/L to <0.005 mg/L

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended.

Power curves are provided to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all parameters)
- # Constituents: 16
- # Downgradient wells: 11

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (chloride, pH, sulfate, and TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, fluoride)
- # Constituents: 7
- # Downgradient wells: 11

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.

- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from natural variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine “background” (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United States Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). When any resample falls

within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural variation rather than a result of impact to groundwater quality downgradient of the facility.

Background Screening Summary Georgia EPD Constituents – Conducted in August 2019

Outliers & Trend Testing

Time series plots are used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers for all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. As a general rule, when the most recent values are identified as outliers, values are not flagged in the database at this time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values

(i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Due to changing reporting limits for many constituents, when the nondetects are replaced with the most recent reporting limit, previously flagged "J" values (or estimated values) may require flagging as outliers if they are much higher than current reporting limits.

Of the outliers identified by Tukey's method, several values were flagged in the database, and the remaining values were similar to other measurements within a given well or neighboring wells or were reported nondetects. Several other values were flagged in addition to those identified by Tukey's because the values were higher than all remaining concentrations and would cause the statistical limits to be elevated.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data. An outlier summary, including both CCR Appendix III and Georgia EPD parameters, follows this letter.

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

Several statistically significant decreasing trends were noted but adjustments were required only for barium in well GWA-53, copper in well GWA-37, and nickel in well GWC-16R because the magnitudes of the trends in other constituents were not large relative to the average concentrations at their respective wells. However, the decreasing trend for zinc at GWC-16R may require adjustment in the future, if it persists, in order to obtain a more conservative prediction limit. Statistically significant increasing trends were also noted but adjustments to eliminate the trends were made only for barium and zinc in well GWA-36 because the magnitudes of trends in the other wells are low relative to the average concentrations. Truncation of earlier data is based on an assumption that the increasing trend is not the result of the facility. This assumption is discussed later along with the use of intrawell methods. A summary of the background data ranges used for these well/constituent pairs follows this letter.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified statistically significant differences among upgradient well data for several of the constituents, suggesting intrawell methods would be the most appropriate statistical method for these constituents. For constituents where variation is not identified, interwell analyses would typically be recommended. However, because this is a lined landfill with pre-waste data showing that metals occur naturally in low level concentrations, and no records required any adjustments due to statistically significant increasing trends in downgradient well data, intrawell methods are recommended as the primary statistical method for all detected well/constituent pairs.

Background Update CCR Appendix III Constituents – Conducted in March 2020

Prior to updating background data, all data were evaluated for the purpose of updating background data sets. The reports were submitted at that time, and a summary is presented in this report.

Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used for all wells for the intrawell parameters and for only the upgradient wells for the interwell parameters. Although Tukey's test noted several potential outliers, only three values (for fluoride, sulfate, and TDS) were flagged as the rest appeared to be representative of natural variation in groundwater quality. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. The Appendix III outliers are included in the outlier summary following this letter.

For constituents requiring intrawell prediction limits (chloride, pH, sulfate, and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through May 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. Statistically significant differences were found between the two groups for the following well/constituent pairs: chloride in upgradient well GWA-54; pH in upgradient well GWA-52 and downgradient well GWC-22R; sulfate in upgradient wells GWA-36 and GWA-54; and TDS in upgradient well GWA-55.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background are not updated to include the newer data unless it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. The following cases with statistically significant Mann-Whitney results were updated because the newer data had a lower median, or the newer data were similar in concentration to portions of the historical data: chloride in upgradient well GWA-54; pH in upgradient well GWA-52 and downgradient well GWC-22R; and sulfate in upgradient wells GWA-36 and GWA-54.

Although TDS in well GWC-55 showed an increase in the median concentration, the overall temporal pattern and range of concentrations for TDS over the period is similar to that in other background wells. Additionally, a similar increase occurred in an upgradient well, thus indicating natural variation independent of the site. This well/constituent pair was, therefore, updated with newer data.

Evaluation of Georgia EPD Constituents – September 2020

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data

population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data, except for the cases mentioned above, within each well with detections through September 2018 (Figure D). The September 2020 data from each well were compared to these intrawell background limits. As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well. The time series, however, substitutes the most recent reporting limit for all wells, using the same limit across all wells. Note that the reporting limit for zinc increased to 0.02 mg/L during this analysis from the historical reporting limit of 0.01 mg/L for some wells. As a result, slight changes were noted in the intrawell prediction limits from the previous sample event. No statistical analyses were included for well/constituent pairs with 100% nondetects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. No statistical exceedances were noted in any of the wells. A summary of the Georgia EPD prediction limits follows this report.

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the

site which is an indication of natural variability in groundwater unrelated to practices at the site. No trend testing was required during this report for the state parameters.

Evaluation of Appendix III Parameters – September 2020

For chloride, pH, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2019 (Figure E). The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. An exceedance was noted for sulfate in wells GWC-21R and GWC-23R, and for total dissolved solids in well GWC-23R. An interwell prediction limit was then constructed using pooled upgradient well data to evaluate the apparent intrawell prediction limit exceedances (Figure F). No statistical exceedances were noted for sulfate. Total dissolved solids in well GWC-23R exceeded the interwell prediction limit of 410 mg/L with a reported measurement of 501 mg/L. An exceedance is noted for TDS since the most recent measurement of TDS at this well is higher than all of the historical measurements. Because both sulfate and TDS observations have been stable since sampling began in 2016, it is possible that the current large increases in both parameters are the result of a sampling or analytical anomaly. If the increases are the result of the facility, it is likely that they will persist in future sampling events.

For boron, calcium, and fluoride, interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through September 2020 (Figure G). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. Summaries of both intrawell and interwell prediction limits follow this report. The following intrawell prediction limits exceedances were noted:

- Calcium: GWC-16R, GWC-17R, GWC-21R, and GWC-23R

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test along with upgradient wells for the same constituents (Figure H). While several statistically significant decreasing trends were noted, statistically significant increasing trends were noted only for sulfate in downgradient well GWC-21R and for TDS in upgradient well GWA-55. Complete graphical results of the trend tests follows this letter.

Resample Reports – Appendix III Parameters – December 2020

Resamples were collected in December 2020 for pH, sulfate, and TDS in well GWC-23R. The intrawell prediction limits using background data through September 2019, which evaluate the December 2020 samples for these well/constituent pairs, are provided at the end of the report (Figure I). An exceedance was identified for sulfate in well GWC-23R.

Following the Two-Step Statistical Analysis as described above, an interwell prediction limit was constructed for the well/constituent pair that exceeded its intrawell limits using data through December 2020. No exceedance was identified and complete graphical results of the interwell prediction limit follow this report (Figure J).

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test as mentioned above (Figure K). While a few statistically significant decreasing trends were noted in upgradient wells, no statistically significant trends were identified for sulfate in well GWC-23R. Complete graphical results of the trend tests follow this letter.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill at Cells 3 & 4. If you have any questions or comments, please feel free to contact us.

Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 180 background values. 2.222% NDs. Annual per-constituent alpha = 0.00133. Individual comparison alpha = 0.00006051 (1 of 2). Comparing 2 points to limit. Assumes 9 future values.

Constituent: Sulfate Analysis Run 11/1/2020 1:30 PM View: PL's Interwell for Intra CCR
 Plant Bowen Client: Southern Company Data: Bowen 3 and 4 CCR

Exceeds Limit: GWC-23R

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 177 background values. 5.65% NDs. Annual per-constituent alpha = 0.001383. Individual comparison alpha = 0.00006289 (1 of 2). Assumes 10 future values.

Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 180 background values. 64.44% NDs. Annual per-constituent alpha = 0.00133. Individual comparison alpha = 0.00006051 (1 of 2). Comparing 11 points to limit.

Constituent: Boron Analysis Run 11/1/2020 1:18 PM View: PL's Interwell CCR
 Plant Bowen Client: Southern Company Data: Bowen 3 and 4 CCR

Exceeds Limit: GWC-16R, GWC-17R, GWC-21R, GWC-23R

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 180 background values. Annual per-constituent alpha = 0.00133. Individual comparison alpha = 0.00006051 (1 of 2). Comparing 11 points to limit.

Constituent: Calcium Analysis Run 11/1/2020 1:18 PM View: PL's Interwell CCR
 Plant Bowen Client: Southern Company Data: Bowen 3 and 4 CCR

Within Limit

Prediction Limit
 Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 180 background values. 55% NDs. Annual per-constituent alpha = 0.00133. Individual comparison alpha = 0.00006051 (1 of 2). Comparing 11 points to limit.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 180 background values. 2.222% NDs. Annual per-constituent alpha = 0.00133. Individual comparison alpha = 0.00006051 (1 of 2). Assumes 10 future values.

GROUNDWATER STATS CONSULTING

January 26, 2021

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Bowen Landfill Cells 9 & 10
September 2020 Event - Statistical Analysis

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater quality for the September 2020 sample event for Georgia Power Company's Plant Bowen Landfill Cells 9 & 10. The analysis complies with the United States Environmental Protection Agency (USEPA) Coal Combustion Residuals (CCR) Rule 40 Code of Federal Regulations (CFR) 257 Subpart D, the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the USEPA Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

The monitoring well network, as provided by Southern Company Services, consists of the following:

Bedrock Wells:

- **Upgradient:** GWA-39RZ, GWA-41R, GWA-43R
- **Downgradient:** GWC-45R, GWC-46R, GWC-47R, GWC-49R

Overburden Wells:

- **Upgradient:** GWA-39Z, GWA-40, GWA-41, GWA-42, GWA-43
- **Downgradient:** GWC-44, GWC-45, GWC-47, GWC-48, GWC-49Z

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil & Environmental Engineering professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated. The terms “parameters” and “constituents” are interchangeable.

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of well/constituent pairs with 100% nondetects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves are provided to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Constituents:

Bedrock Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan – (all parameters)
- # Constituents: 16
- # Downgradient wells: 4

Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-3 resample plan (all parameters)
- # Constituents: 15 (Silver is not included because it is 100% nondetect in all overburden wells.)
- # Downgradient wells: 5

CCR Appendix III Constituents:

Bedrock & Overburden Wells:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (calcium, chloride, sulfate, TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, fluoride, pH)
- # Constituents: 7
- # Downgradient wells: 9

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the practical quantification limit (PQL) as reported by the laboratory.

- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from natural variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds

the intrawell prediction limit (United States Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural variation rather than a result of impact to groundwater quality downgradient of the facility.

Background Screening Summary Georgia EPD Constituents – Conducted in August 2019

Outlier and Trend Testing – Bedrock & Overburden Wells

Time series plots are used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of those findings were submitted with the screening report and a summary of the flagged values follows this letter (Figure C).

Using the Tukey box plot method, several outliers were identified. For information purposes, when the most recent values are identified as outliers, values are not flagged in

the database at this time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Of the outliers identified by Tukey's method, several values were flagged as such in the database. When the test identified values that were similar to other measurements within a given well or neighboring wells or were reported nondetects, these values were not flagged. All values flagged in the database as outliers are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections, and the results of those findings were submitted with the screening report.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. The trend analyses results were submitted with the screening report.

Statistically significant decreasing trends were noted for barium in Bedrock wells GWC-47R and GWC-49R, and in Overburden well GWC-49Z. No adjustments were

required to these records because the magnitudes of these trends are low relative to the average concentrations at these wells. In the future, if adjustments are made to any records, a summary will be provided with the report.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells and the results were submitted with the screening report. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intra-well tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

For the Bedrock wells, the ANOVA identified significant differences among upgradient well data for barium. No significant differences were noted for antimony, arsenic, beryllium, chromium, cobalt, copper, lead, mercury, nickel, thallium, vanadium, and zinc. The ANOVA could not test cadmium, selenium, and silver as there was no variation in the measurements among the upgradient wells.

For the Overburden wells, the ANOVA identified significant differences among upgradient well data for: antimony, barium, cadmium, and cobalt. No significant differences were noted for arsenic, chromium, copper, lead, mercury, nickel, thallium, and zinc. The ANOVA could not test beryllium, selenium, silver, and vanadium as there was no variation in the measurements among the upgradient wells.

Where variation is identified, the intra-well method is generally recommended as the most powerful statistical method providing groundwater quality is presumed to be unimpacted by practices at the facility in downgradient wells. Where variation is not identified, this suggests that interwell analysis would be considered for the statistical method for these constituents. However, because this is a lined landfill with pre-waste data showing that metals occur naturally in low level concentrations, and no records required any adjustments due to statistically significant increasing trends in data sets, intra-well methods are recommended as the primary statistical method for all detected well/constituent pairs.

Establishing Statistical Limits

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed concentrations upgradient for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-3 resample plan, are constructed using all available data within each well with detections through September 2018. Compliance data are compared to these intrawell background limits during each subsequent semi-annual sampling event. As previously discussed, no statistical analyses were included for well/constituent pairs where there are 100% nondetects in the downgradient well.

In the event of an initial exceedance of compliance well data, the 1-of-3 resample plan allows for collection of two additional samples to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. Additionally, in the future, the two-step statistical analysis described above will be applied before an SSI is confirmed.

Summary of Background Update for CCR Appendix III Parameters – March 2020

Prior to updating background data in March 2020, Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used for all wells for the intrawell parameters and for only the upgradient wells for the interwell parameters. Tukey's test noted several potential outliers in downgradient wells for intrawell

parameters, but these values were not flagged as they appeared to be representative of natural variation. Although not noted on Tukey's test, a high value for sulfate in downgradient well GWC-44 was flagged as an outlier to construct statistical limits that are conservative from a regulatory perspective. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter (Figure C).

For constituents requiring intrawell prediction limits (calcium, chloride, sulfate, and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through July 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The results of the Mann-Whitney test were submitted with the screening. Statistically significant differences were found between the two groups for the following well/constituent pairs: calcium in upgradient well GWA-43 and downgradient well GWC-49Z; chloride in downgradient well GWC-46R; sulfate in upgradient wells GWA-40 and GWA-43, and downgradient well GWC-49R; and TDS in upgradient well GWA-39Z.

Typically, when the test concludes that the medians of the two groups are significantly different, particularly in the downgradient wells, the background data are not updated to include the newer data unless it can be reasonably justified that the change in concentrations reflects a naturally occurring shift unrelated to practices at the site. In studies such as the current one, in which one or both of the segments being compared are short, the comparison is complicated by the fact that normal short-term variation may be mistaken for a long-term change in medians. In this analysis all of the cases with statistically significant Mann-Whitney results were updated. The individual cases are discussed below.

For chloride in downgradient well GWC-46R, the newer data had only a slightly lower median, and reported measurements were similar to those observed earlier in the record. For calcium in downgradient well GWA-43 and upgradient well GWC-49Z and sulfate in upgradient well GWA-43, the newer, lower concentrations are very similar to those in the later portion of the historical data segments.

Although sulfate in well GWA-40 and TDS in well GWA-39Z showed increases in median concentrations, these are upgradient wells which reflect natural variation in groundwater unrelated to the facility. Additionally, the patterns and concentrations are similar to those in other upgradient wells. An increase in median concentrations was also noted for sulfate

in downgradient well GWC-49R, but the magnitude of the increase is minimal relative to the variation in other wells for sulfate.

For calcium, chloride, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data within each well through September 2019. Future compliance observations at each well are compared to these background limits during each subsequent semi-annual sampling event.

For boron, fluoride, and pH, which are evaluated using interwell prediction limits, the Sen's Slope/Mann-Kendall trend test was used on upgradient wells to determine whether concentrations are statistically increasing, decreasing or stable over time. No statistically significant increasing trends were noted; however, statistically significant decreasing trends were noted for boron in wells GWA-41R, GWA-43R, and GWA-39RZ, and pH in wells GWA-41R and GWA-43. The apparent decreasing trends in boron are exaggerated by high nondetect values early in the record. Since the other trends were of short duration and relatively low in magnitude with concentrations similar to those in neighboring upgradient wells, no adjustments were necessary. However, if these trends persist, particularly the decreasing trend in pH at GWA-43, the background period may need to be adjusted to provide representative interwell limits. The trend tests results were included with the screening.

All background data sets for the constituents listed above were updated using all available data from upgradient wells through September 2019. The interwell prediction limits are used to evaluate future compliance samples for the above constituents at each downgradient well.

Statistical Analysis of Georgia EPD Constituents – September 2020 Sample Event

Intrawell prediction limits, combined with a 1-of-3 resample plan for Bedrock and Overburden wells were constructed separately using all available data within each well with detections through September 2018 (Figures D and E, respectively). Compliance data are compared to these intrawell background limits during each subsequent semi-annual sampling event. A substitution of the most recent reporting limit was applied when varying detection limits existed in data. For some parameters such as zinc and cobalt, different reporting limits exist among wells. While the lowest reporting limit is plotted for all wells on the time series graphs for a given constituent, the most recent reporting limit for an individual wells is used as the nondetect substitution for the intrawell prediction limits. During this analysis, the reporting limit for zinc in Bedrock upgradient well GWA-43R increased to 0.02 mg/L compared to the historical reporting limit of 0.01 mg/L. Additionally, the reporting limit for cobalt in Overburden upgradient well GWA-39Z

decreased to 0.005 mg/L from the historical reporting limit of 0.01 mg/L. Therefore, slight changes were noted in the resulting intrawell prediction limits for both of these upgradient wells.

As previously discussed, no statistical analyses were included for well/constituent pairs with 100% nondetects.

In the event of an initial exceedance of compliance well data, the 1-of-3 plan allows collection of up to two samples. When both resamples confirm the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. The following prediction limit exceedances were noted:

Bedrock

- Barium: GWA-39RZ (upgradient) and GWC-49R
- Zinc: GWC-47R

Overburden

- Antimony: GWC-45

When exceedances are noted upgradient of the facility, it is an indication of naturally occurring changes in groundwater quality. Interwell prediction limits were then constructed using pooled upgradient well data to evaluate the apparent intrawell prediction limit exceedance for the Bedrock and Overburden downgradient wells (Figures F and G, respectively). For the Bedrock wells, zinc was found to exceed the interwell prediction limit for well GWC-47R. For the Overburden wells, antimony was found to exceed its interwell prediction limit in well GWC-45. Summaries of the Georgia EPD prediction limits follow this report.

When prediction limit exceedances occur, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable. Upgradient wells are also included in the trend analyses along with downgradient to identify whether similar patterns exist upgradient of the site which is an indication of natural variability in groundwater unrelated to practices at the site. No statistically significant trends were present in any of the well/constituent pairs. A summary of the trend test results for the Bedrock and Overburden wells follows this letter (Figures H and I, respectively).

Statistical Analysis of CCR Appendix III Parameters – September 2020 Sample Event

For calcium, chloride, sulfate, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through September 2019 (Figure J). The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. Exceedances were noted for the following:

- Chloride: GWC-48
- Sulfate: GWC-48

Interwell prediction limits were then constructed using pooled upgradient well data to evaluate the apparent intrawell prediction limit exceedances (Figure K). No interwell prediction limit exceedances were noted.

For boron, fluoride, and pH, which are evaluated using interwell prediction limits, combined with a 1-of-2 resample plan, prediction limits were constructed using all historical data through September 2020 (Figure L). The most recent sample from each downgradient well is compared to the background limit to determine whether there are exceedances over background. Exceedances were noted for the following:

- pH (lower limit): GWC-44, GWC-45, GWC-48, GWC-49R, and GWC-49Z

Data from well/constituent pairs found to exceed their respective prediction limits were further evaluated using the Sen's Slope/Mann Kendall trend test. Upgradient wells were included for any constituents requiring trend tests in downgradient wells (Figure M). The following statistically significant trends were noted:

Increasing:

- Chloride: GWC-48

Decreasing:

- Chloride: GWA-39Z (upgradient)
- pH: GWA-41R (upgradient), GWA-43 (upgradient) and GWC-49Z
- Sulfate: GWA-39Z (upgradient) and GWA-43 (upgradient)

Resample Reports – December 2020

Resamples were collected in December 2020 for antimony and pH in well GWC-45. The state intrawell prediction limit using background data through September 2018, which

evaluates the December 2020 sample for this well/constituent pair, is provided at the end of the report (Figure N). No exceedance was identified for antimony in well GWC-45; therefore, no further action is required. However, the federal interwell prediction limit using background data through December 2020 for pH in well GWC-45 was found to exceed its respective interwell prediction limit (Figure O).

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test as mentioned above (Figure P). While a few statistically significant decreasing trends were noted in upgradient wells for pH, no statistically significant trends were identified. Complete graphical results of the trend tests follow this letter.

Summary

The following intrawell prediction limit exceedances were noted for the Georgia EPD parameters:

Bedrock

- Barium: GWA-39RZ (upgradient) and GWC-49R
- Zinc: GWC-47R

Overburden

- Antimony: GWC-45

The following intrawell and interwell prediction limit exceedances were noted for the CCR parameters:

Intrawell Prediction Limits

- Chloride: GWC-48
- Sulfate: GWC-48

Interwell Prediction Limits

- pH (lower limit): GWC-44, GWC-45, GWC-48, GWC-49R, and GWC-49Z

For apparent intrawell prediction limit exceedances, interwell prediction limits were constructed as discussed earlier in the Two-Step Analysis Approach. No interwell exceedances were noted except for the following:

Bedrock

- Zinc: GWC-47R

Overburden

- Antimony: GWC-45

Trend analyses were conducted on all intrawell and interwell prediction limit exceedances, and no statistically significant trends were noted for the Georgia EPD parameters. The following statistically significant trends were noted for the CCR Appendix III parameters:

Increasing:

- Chloride: GWC-48

Decreasing:

- Chloride: GWA-39Z (upgradient)
- pH: GWA-41R (upgradient), GWA-43 (upgradient) and GWC-49Z
- Sulfate: GWA-39Z (upgradient) and GWA-43 (upgradient)

After resampling in December 2020 for antimony and pH in well GWC-45, no statistical exceedance was identified for antimony, but pH exceeded its respective interwell prediction limit. Although a few upgradient wells for pH exhibited statistically significant decreasing trends, no statistically significant trends were noted for pH in well GWC-45.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen Landfill at Cells 9 & 10. If you have any questions or comments, please feel free to contact us.

Prediction Limit
 Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 11) were censored; limit is most recent reporting limit. Well-constituent pair annual alpha = 0.005605. Individual comparison alpha = 0.002806 (1 of 3).

Constituent: Thallium Analysis Run 10/30/2020 3:10 PM View: Overburden Wells

Within Limit

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 44 background values. Annual per-constituent alpha = 0.0005234. Individual comparison alpha = 0.00006544 (1 of 3). Assumes 3 future values.

Constituent: Barium Analysis Run 10/30/2020 2:43 PM View: Trend Tests - Bedrock State PL Exceedance
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Exceeds Limit: GWC-47R

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 38 background values. 52.63% NDs. Annual per-constituent alpha = 0.0007641. Individual comparison alpha = 0.00009554 (1 of 3). Assumes 3 future values.

Within Limit

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 121 background values. Annual per-constituent alpha = 0.002391. Individual comparison alpha = 0.000133 (1 of 2). Assumes 8 future values.

Constituent: Chloride Analysis Run 10/30/2020 3:51 PM View: Trend Tests - CCR
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Hollow symbols indicate censored values.

Within Limit

Prediction Limit Interwell Parametric

Background Data Summary (based on cube root transformation): Mean=1.48, Std. Dev.=0.4911, n=121, 4.959% NDs. Normality test: Chi Squared @alpha = 0.01, calculated = 13.63, critical = 14.07. Kappa = 1.93 (c=7, w=9, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0008358. Assumes 8 future values.

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 120 background values. 62.5% NDs. Annual per-constituent alpha = 0.002422. Individual comparison alpha = 0.0001347 (1 of 2). Comparing 9 points to limit.

Constituent: Boron Analysis Run 10/30/2020 4:04 PM View: CCR PL's Interwell
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Within Limit

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 120 background values. 57.5% NDs. Annual per-constituent alpha = 0.002422. Individual comparison alpha = 0.0001347 (1 of 2). Comparing 9 points to limit.

Constituent: Fluoride Analysis Run 10/30/2020 4:04 PM View: CCR PL's Interwell
Plant Bowen Client: Southern Company Data: Bowen 9 and 10 CCR

Exceeds Limits: GWC-44, GWC-45, GWC-48, GWC-49R, GWC-49Z

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 125 background values. Annual per-constituent alpha = 0.004528. Individual comparison alpha = 0.0002518 (1 of 2). Comparing 9 points to limit.

Constituent: pH Analysis Run 10/30/2020 4:04 PM View: CCR PL's Interwell

APPENDIX C
MEMORANDUM ON HYDROGEOLOGIC MONITORING
PROGRAM

Memo

To: Joju Abraham, P.G.
Southern Company Services, Inc.

From: Rhonda Quinn, P.G. Wood Environment & Infrastructure Solutions, Inc.

CC: Greg Wrenn, P.E. Wood Environment & Infrastructure Solutions, Inc.

Re: Solid Waste Disposal Facility Permit No. 008-018D (LI) - Hydrogeological Monitoring Program May 1, 2020 through December 5, 2020
01/27/2021

Background

Wood Environment & Infrastructure Solutions, Inc. (Wood) was retained by Southern Company Services, Inc. (SCS), to assist with the hydrogeological (water level) monitoring program at Georgia Power Company's Plant Bowen (Site) landfill cells 1 & 2, 3 & 4, 9 & 10. The work is being conducted to comply with Georgia Department of Natural Resources Environmental Protection Division (EPD) Solid Waste Permit No. 008-018D (LI) to assist with early detection of subsurface changes that might indicate land subsidence or sinkhole formation. Groundwater level fluctuations are monitored in accordance with Section 3.6.5 of the *Plant Bowen Proposed Coal Combustion By-Product Monofill Addendum I Site Acceptability Report – Hydrogeological Assessment and Demonstration of Engineering Measures* (SCS 2004).¹

The Site utilizes In-Situ[®] Instruments, Inc. Win-Situ[®] telemetry and reporting software and pressure transducers to collect and record groundwater elevations from monitoring wells located around the perimeter of the landfill cells. At Cells 1 & 2 of the solid waste landfill, transducers are deployed in six soil wells (GWA-1 (soil/rock), GWA-3, GWC-7Z, GWC-11, GWC-13, and GWC-15) and six rock wells (GWA-2R, GWC-6RZ, GWC-8RR, GWC-11R, GWC-13R, and GWC-15R). In 2015, the program was expanded to include Cells 3 & 4 where five soil wells (GWC-18, GWA-36, GWA-37, GWA-53, and GWA-55) and eight rock wells (GWC-16R, GWC-18R, GWC-21R, GWC-24R, GWC-25R, GWA-36R, GWA-53R, and GWA-55R) are equipped with transducers. In 2016, the program was expanded further to include Cells 9 & 10 where currently six soil wells (GWA-39Z, GWA-41, GWA-43, GWC-45, GWC-47, and GWC-49Z)

and six rock wells (GWA-39RZ, GWA-41R, GWA-43R, GWC-45R, GWC-47R, and GWC-49R) are equipped with transducers. Etowah River levels and rainfall data for the reporting period were obtained from a U.S. Geological Survey gauge (02394670) near Cartersville, Georgia.

Water level data are electronically logged multiple times daily by each transducer. Most logged data are uploaded after each reading via satellite telemetry to a central In-Situ® database. Automated reports are accessible via the In-Situ® database website where the telemetry data are stored and compiled. Data from wells not connected to the site telemetry system are manually downloaded directly from the transducer because the transducers are set to log and store data internally multiple times throughout each day. Water level data are monitored for unusual groundwater level fluctuations. Remote monitoring continued without transducer maintenance March through July 2020 due to Covid-19 pandemic precautions. Site visits for transducer maintenance resumed in August 2020.

Maintenance Observations

During the reporting period, the following well locations (GWA-2R, GWA-3, GWC-7Z, GWC-11, GWC-11R, GWC-13, GWA-24R, GWA-36R, GWA-53, GWA-53R, GWA-55, GWA-39RZ, GWA-39Z, and GWA-49R) were visited on one or more occasions for maintenance, manual data downloads, battery change outs, transducer replacement, solar panel adjustment, or reconnection of modem or transducer cables. The data, during this reporting period, for these transducer locations are not continuous due to transducers being offline during repairs or no access to the Site during Covid-19 pandemic precautions. During the past six-month period, transducers from wells GWC-7Z, GWC-11R, GWC-13, GWA-53, GWA-55, and GWC-49R were returned to In-Situ® for repair or exchanged for a new transducer and reinstalled. In addition, modems were replaced at location GWA-2R and GWC-24R. Wood has continued to update the firmware to current versions at each location since November 2018 to improve communication.

Water Level Fluctuations

Continuous groundwater level data and river stage elevations were recorded between May 1, 2020 and December 5, 2020. Reporting period hydrographs for Cells 1 & 2, 3 & 4, and 9 & 10 are shown in Figures 1A through 3B.

Table 1 lists the groundwater sampling, water level gauging and transducer maintenance activities during the reporting period and are considered known disruptions. Figures 1A through 3B show the transducer water level data for the reporting period. Table 2 summarizes the data gaps or maintenance issues for the reporting period and recommendations for repairs and includes the

most recent repairs completed up to December 5, 2020. Repairs consisted of resetting reference water elevation depth, resealing boxes, ant infestation control, and replacing power controller units and batteries. Over time the transducer elevation drifts, possibly attributed to the transducer being periodically removed for sampling, gauging or maintenance activities. To remedy this, in periodic maintenance is needed to mark and mount the transducer cable to a fixed location such that the transducer is consistently returned to the same depth. When an adjustment is made, the reference depth to actual water elevation is re-set and the logging cycle re-started. The marking and securing of the transducers continued during this reporting period. Table 2 is a record of the maintenance completed during the reporting period.

The water levels in monitoring wells equipped with transducers exhibited similar overall trends during the reporting period. Groundwater elevations show an overall decreasing trend during this six-month period with a decrease visible May through August 2020 and then more stable conditions with a slight increase in the fall. The fluctuations of groundwater elevations mimic the Etowah River levels in response to rain events and wet conditions. Some of this hydrograph response may be attributable to the fluctuations in water levels in the nearby General Service Water Pond. Groundwater in both the overburden and bedrock aquifers responded to rainfall events; however, the time to peak groundwater elevations varied between wells. During this monitoring period, the potentiometric surface of the bedrock aquifer remained above the top of competent bedrock in the instrumented monitoring wells. This higher hydrostatic pressure of the bedrock aquifer limits removal of material from the overburden that could result in subsidence issues. The observed variations in groundwater elevations are attributed to rainfall variations, or due to sampling or maintenance activities at the monitoring points. A comparison of river stage and precipitation data with recorded groundwater elevations (Figures 1A through 3B) shows that both sets of data follow similar overall patterns.

Conclusions and Recommendations

Observed disruptions in the transducer water level were found to be directly attributed to drawdown during sampling events, water level gauging, maintenance of wells, transducers, or telemetry units, or significant rainfall events. The May 1, 2020 to December 5, 2020 hydrologic monitoring data did not show water level fluctuations attributed to subsurface changes that might be indicative of land subsidence or sinkhole formation. Based on data for the current reporting period (May 1, 2020 to December 5, 2020), Wood recommends the following actions:

- Periodically calibrate elevations to correct for transducer elevation drift.
- Perform the necessary maintenance or replacement of non-functioning transducer equipment in wells to restore function and continue with routine transducer/telemetry system maintenance to ensure that future data are consistent.
- Manually download data, monthly, when a telemetry unit is offline (i.e. not transmitting data to the remote database). This will ensure that data are being reviewed on a consistent and timely basis.
- Trim tree branches as necessary to allow more sunlight to reach the solar panels and charge batteries.
- Field check equipment to make certain insect infestation is not damaging equipment.

Table 1
Known Sampling and Gauging Events Relative to Water Level Fluctuations
May 1, 2020 through December 5, 2020
Georgia Power - Plant Bowen
Wood Project No. 6122160287

Solid Waste Disposal Cells	Well ID	Date Well Gauged	Date Well Sampled	Sampling Comments	Most Recent Transducer Network Maintenance Per Well	Comments
1&2	GWA-1	9/1/2020	9/15/2020	Groundwater CCR Event #15		
					9/8/2020	Removed the modem to send to In-Situ for maintenance.
	GWA-2R	9/1/2020	9/15/2020	Groundwater CCR Event #15	11/18/2020	Replaced weather gasket inside of telemetry enclosure and reinstalled modem. Worked with satellite company to bring back online.
	GWA-3	9/1/2020	Purged on 9/16/2020, Not Sampled	Groundwater CCR Event #15	8/6/2020	Transducer cable appeared to have an electrical arc burn where it connects into the transducer. Elevated pH values were recorded in the well during the September sampling event. Well casing has cracks.
	GWC-6RZ	9/1/2020	9/16/2020	Groundwater CCR Event #15		
	GWC-7Z	9/1/2020	9/16/2020	Groundwater CCR Event #15	9/8/2020	Replaced transducer.
					11/16/2020	Fixed solar panel connection issue and replaced telemetry system battery.
	GWC-8RR	9/1/2020	9/17/2020	Groundwater CCR Event #15		
	GWC-11	9/1/2020	9/21/2020	Groundwater CCR Event #15	8/7/2020	Fixed device address issues and replaced all transducer batteries.
					11/16/2020	Hornet nest present on the telemetry system and large ant colony inside of well.
	GWC-11R	9/1/2020	9/21/2020	Groundwater CCR Event #15	8/7/2020	Replaced transducer.
	GWC-13	9/1/2020	9/22/2020	Groundwater CCR Event #15	8/7/2020	Transducer battery was dead. Removed transducer and sent to In-Situ.
					11/16/2020	Reinstalled repaired transducer.
	GWC-13R	9/1/2020	no longer sampled	Groundwater CCR Event #15		
GWC-13RZ	9/1/2020	9/22/2020	Groundwater CCR Event #15			
GWC-15 and GWC-15Z	9/1/2020	9/21/2020	Groundwater CCR Event #15		GWC-15 is equipped with a transducer. GWC-15 is no longer sampled, but is measured for water levels. Nearby well GWC-15Z is not equipped with a transducer, but gauging and sampling in this well influences adjacent well GWC-15. GWC-15Z was sampled on the dates shown.	
GWC-15R	9/1/2020	9/21/2020	Groundwater CCR Event #15			
3&4	GWC-16R	9/1/2020	9/9/2020	Groundwater CCR Event #15		No functional issues during this reporting period, but water level fluctuations not evident in well. Uncertain lack of fluctuations is due to hydrogeologic condition or equipment.
	GWC-18	9/1/2020	9/9/2020	Groundwater CCR Event #15		
	GWC-18R	9/1/2020	9/9/2020	Groundwater CCR Event #15		
	GWC-21R	9/1/2020	9/8/2020	Groundwater CCR Event #15		
	GWC-24R	9/1/2020	9/9/2020	Groundwater CCR Event #15	9/8/2020	Modem removed for repairs.
					11/16/2020	Replaced the modem and telemetry enclosure. Worked with satellite company to bring back online.
	GWC-25R	9/1/2020	9/4/2020	Groundwater CCR Event #15	9/8/2020	Replaced telemetry system battery.
					11/16/2020	Re-calibrated transducer to report more accurate groundwater elevation.
	GWA-36	9/1/2020	9/3/2020	Groundwater CCR Event #15		
	GWA-36R	9/1/2020	9/14/2020	Groundwater CCR Event #15	8/7/2020	Troubleshooting due to sporadic reporting to the ISI database. Recalibrated transducer
	GWA-37	9/1/2020	9/3/2020	Groundwater CCR Event #15	11/24/2020	Transducer stopped reporting on 11/24/2020.
	GWA-53	9/1/2020	9/8/2020	Groundwater CCR Event #15	11/16/2020	Replaced transducer and worked with satellite company to bring modem back online
	GWA-53R	9/1/2020	9/8/2020	Groundwater CCR Event #15	8/7/2020	Replaced all telemetry batteries.
11/16/2020					Corrected device address.	
GWA-55	9/1/2020	9/4/2020	Groundwater CCR Event #15	11/16/2020	Replaced transducer.	
GWA-55R	9/1/2020	9/4/2020	Groundwater CCR Event #15	8/7/2020	Replaced all telemetry batteries.	
9 & 10	GWA-39RZ	9/1/2020	9/16/2020	Groundwater CCR Event #15	11/18/2020	Rebooted the modem and started reporting again. Not reporting as of 11/30/2020. Troubleshoot and download data during next site visit.
	GWA-39Z	9/1/2020	9/10/2020	Groundwater CCR Event #15	11/18/2020	Rebooted the modem and started reporting again. Not reporting as of 11/30/2020. Troubleshoot and download data during next site visit.
	GWA-41	9/1/2020	9/10/2020	Groundwater CCR Event #15		
	GWA-41R	9/1/2020	9/10/2020	Groundwater CCR Event #15		
	GWA-43	9/1/2020	9/11/2020	Groundwater CCR Event #15		
	GWA-43R	9/1/2020	9/14/2020	Groundwater CCR Event #15		
	GWC-45	9/1/2020	9/11/2020	Groundwater CCR Event #15		
	GWC-45R	9/1/2020	9/11/2020	Groundwater CCR Event #15		
	GWC-47	9/1/2020	9/14/2020	Groundwater CCR Event #15

Project Number: 6122-16-0287

Cell	Monitoring Well	Date	Maintenance Information	Recommendations
Cells 1&2	GWA-1		No functional issues during this reporting period.	No action needed.
Cells 1&2	GWA-2R	9/8/2020	Removed the modem to send to In-Situ for maintenance.	Replace modem and weather gasket.
Cells 1&2	GWA-2R	11/18/2020	Replaced weather gasket inside of telemetry enclosure and reinstalled modem. Worked with satellite company to bring back online.	No action needed. Check weather gasket to ensure it is keeping a good seal.
Cells 1&2	GWA-3	8/6/2020	Transducer cable appeared to have an electrical arc burn where it connects into the transducer. Elevated pH values were recorded in the well during the September sampling event. Well casing has cracks.	Well scheduled to be replaced. Reinstall transducer following well replacement.
Cells 1&2	GWC-6RZ		No functional issues during this reporting period.	No action needed.
Cells 1&2	GWC-7Z	9/8/2020	Replaced transducer.	No action needed.
Cells 1&2	GWC-7Z	11/16/2020	Fixed solar panel connection issue and replaced telemetry system battery.	No action needed.
Cells 1&2	GWC-8RR		No functional issues during this reporting period.	No action needed.
Cells 1&2	GWC-11	8/7/2020	Fixed device address issues and replaced all transducer batteries.	No action needed.
Cells 1&2	GWC-11	11/16/2020	Hornet nest present on the telemetry system and large ant colony inside of well.	Remove insect infestation from system and interior of the well.
Cells 1&2	GWC-11R	8/7/2020	Replaced transducer.	No action needed.
Cells 1&2	GWC-13	8/7/2020	Transducer battery was dead. Removed transducer and sent to In-Situ.	Replace transducer on next field visit
Cells 1&2	GWC-13	11/16/2020	Reinstalled repaired transducer.	No action needed.
Cells 1&2	GWC-13R		No functional issues during this reporting period.	No action needed.
Cells 1&2	GWC-15		No functional issues during this reporting period.	No action needed.
Cells 1&2	GWC-15R		No functional issues during this reporting period.	No action needed.
Cells 3&4	GWC-16R		No functional issues during this reporting period, but water level fluctuations not evident in well. Uncertain lack of fluctuations is due to hydrogeologic condition or equipment.	Install new well cap or drill hole in well stick up to allow well to vent.
Cells 3&4	GWC-18		No functional issues during this reporting period.	No action needed.
Cells 3&4	GWC-18R		No functional issues during this reporting period.	No action needed.
Cells 3&4	GWC-21R		No functional issues during this reporting period.	Troubleshoot and download data. Likely needs telemetry battery replaced.
Cells 3&4	GWC-24R	9/8/2020	Modem Removed for Repairs.	Reinstall Modem
Cells 3&4	GWC-24R	11/16/2020	Replaced the modem and telemetry enclosure. Worked with satellite company to bring back online.	No action needed.
Cells 3&4	GWC-25R	9/8/2020	Replaced telemetry system battery.	Troubleshoot and download data. Likely needs telemetry battery replaced. Tree cover in area is preventing battery recharge.
Cells 3&4	GWC-25R	11/16/2020	Re-calibrated transducer to report more accurate groundwater elevation.	No action needed.
Cells 3&4	GWA-36		No functional issues during this reporting period.	No action needed.
Cells 3&4	GWA-36R	8/7/2020	Troubleshooting due to sporadic reporting to the ISI database. Recalibrated transducer	May need to remove and replace modem and/or transducer.
Cells 3&4	GWA-37	11/24/2020	Transducer stopped reporting on 11/24/2020.	Download data and troubleshoot telemetry system during next site visit.
Cells 3&4	GWA-53	11/16/2020	Replaced transducer and worked with satellite company to bring modem back online	No action needed.
Cells 3&4	GWA-53R	8/7/2020	Replaced all telemetry batteries.	Not reporting after maintenance. Check transducer and device address.
Cells 3&4	GWA-53R	11/16/2020	Corrected device address.	No action needed.
Cells 3&4	GWA-55	11/16/2020	Replaced transducer.	No action needed.

PROFESSIONAL GROUND WATER SCIENTIST CERTIFICATION

I certify that I am a qualified ground-water scientist who has received a baccalaureate or post-graduate degree in the natural sciences or engineering, and have sufficient training and experience in ground-water hydrology and related fields, as demonstrated by state registration and completion of accredited university courses, that enable me to make sound professional judgments regarding ground-water monitoring and contaminant fate and transport. I further certify that this report was prepared by myself or by a subordinate working under my direction.

1.0 INTRODUCTION

This Alternate Source Demonstration for March 2020 Semi-Annual Event (ASD) has been prepared in accordance with 391-3-4.14.23(c) of the Georgia Solid Waste Management Rules to support the position that statistically significant increases (SSIs) in constituent concentrations over background as presented in *the 2020 Semi-Annual Groundwater Monitoring & Corrective Action Report*, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated August 31, 2020 are a result of the natural variability in groundwater quality and not a release from the landfill cells. This ASD addresses those March 2020 SSIs in wells that have not previously been addressed in past ASDs (August 2017 and April 2018), although it should be noted that the SSIs addressed herein are for the same constituents as those covered in previous ASDs.

This document satisfies the requirements of 391-3-4.14.23(c) which allows an owner or operator to demonstrate that a source other than the Landfill Cells 1 & 2, 3 & 4, and 9 & 10 has caused an SSI and that the apparent SSI was the result of an alternate source or resulted from errors in “sampling, analysis, statistical evaluation, or natural variation in groundwater quality”.

1.1 Background

The Georgia Power Company (GPC) Plant Bowen solid waste disposal facility (Site) is located in south Bartow County off State Highway 113, approximately 7 miles west-southwest of Cartersville and 20 miles southeast of Rome. The disposal facility is approximately 300 acres located on a previously undeveloped, contiguous portion of the plant property. The disposal facility (**Figure 1: Monitoring Well Network March 2020**) receives coal combustion by-products, coal ash and gypsum, from coal-burning and flue gas desulfurization processes at the Site.

The Plant Bowen solid waste disposal facility is operated in accordance with Georgia Environmental Protection Division (EPD) Solid Waste Permit No. 008-018D (LI). Groundwater monitoring is conducted as per the permit requirements specified in the Design and Operation (D&O) Plan. This includes semi-annual groundwater sampling and continuous groundwater level measurements at the Site. In addition, background sampling for the U.S. Environmental Protection Agency’s (USEPA) Coal Combustion Residuals (CCR) Rule was conducted from February 2016 through June 2017.

In March 2020, the first semi-annual groundwater monitoring event for 2020 was conducted in accordance with the D&O Plan. Antimony, barium, zinc, pH, calcium, chloride, sulfate, and total dissolved solids (TDS) were detected in some downgradient wells at concentrations outside of their statistical prediction limits. This report demonstrates that these SSIs do not indicate a release from the lined Landfill Cells 1 & 2, 3 & 4, and 9 & 10, but rather the SSIs reflect natural variation in groundwater quality.

2.0 SUMMARY OF STATISTICAL EXCEEDANCES

As presented in the *2020 Semi-Annual Groundwater Monitoring & Corrective Action Report, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10* (August 2020), there were two metals and five CCR Appendix III parameters, as listed below, exhibiting SSIs outside their statistical prediction limits. The 2020 semi-annual report lists other SSIs that are not listed below because those SSIs have been addressed in the August 2017 Alternate Source Demonstration (antimony and nickel for wells GWC-16R and GWC-21R) and April 2018 Alternate Source Demonstration (barium, zinc, pH, calcium, chloride, sulfate, and TDS for various wells). These SSIs listed below have not been addressed in a past ASD.

Constituent	Wells with Constituent Concentrations Above Statistical Prediction Limits Not Previously Addressed in an ASD
Barium	GWC-49R
Zinc	GWC-47R
pH	GWC-9, GWC-49R
Calcium	GWC-5, GWC-6, GWC-45R
Chloride	GWC-10R, GWC-14Z, GWC-45R
Sulfate	GWC-14Z, GWC-21R, GWC-45R
Total Dissolved Solids	GWC-45, GWC-45R, GWC-48

Additional details regarding these statistical exceedances are summarized on **Table 1: Summary of March 2020 Statistical Exceedances Not Previously Addressed in an ASD**. The exceedances shown in **Table 1** were not re-sampled because these exceedances were for the same constituents (barium, zinc, calcium, chloride, pH, sulfate, and TDS) that have been addressed in previous ASDs.

3.0 ALTERNATE SOURCE DEMONSTRATION

Georgia Solid Waste Management Rule 391-3-4.14.23(c) allows the owner to demonstrate that a source other than the Landfill Cells 1 & 2, 3 & 4, and 9 & 10 caused the SSI or that the apparent statistical exceedance resulted from error in sampling, analysis, statistical evaluation, or from natural variation in groundwater quality. Pursuant to 391-3-4.14.23(c), the following is provided as a demonstration that the listed SSIs are due to natural variation in groundwater chemistry and not a release from the Landfill Cells 1 & 2, 3 & 4, and 9 & 10.

3.1 General Evaluation of the Statistical Exceedances

Barium and zinc exceeded their statistical prediction limits in one well each. Five of the seven Appendix III parameters (calcium, chloride, pH, sulfate, and TDS) were sporadically detected in a few wells at concentrations above their statistical prediction limits. Boron and fluoride concentrations did not exceed statistical prediction limits. **Tables 2, 3, and 4: Evaluation of Statistical Exceedances for Landfill Cells 1 & 2, 3 & 4, and 9 & 10 – March 2020** show which wells and parameters exhibit a statistical exceedance on a grid format. The purpose of the tables is to present a comprehensive snapshot of the downgradient data for each subject landfill cell. The table for each landfill cell shows a red square where there is a statistical exceedance; and as indicated on **Tables 2, 3, and 4** the red squares are scattered across each of the landfill cells. The tables highlight the following line of information that demonstrates that the SSIs are the result of natural variability in groundwater quality and not a release from the Landfill Cells 1 & 2, Cells 3 & 4, and Cells 9 & 10.

Landfill Cells 1 & 2, Cells 3 & 4, and Cells 9 & 10 were constructed with liner systems to prevent waste materials from leaching into underlying groundwater, in accordance with Solid Waste Permit No. 008-018D (LI). Cells 3 & 4 have a leachate collection system in addition to the liner system. If a release were present, the data would be expected to exhibit multiple exceedances for multiple wells within each landfill cell. Only GWC-45R showed exceedances of more than two Appendix III parameters. Review of the SSIs presented on the tables does not show a grouping of exceedances, as would be expected from a release, they show a scattered distribution. Additionally, those downgradient wells that show statistical exceedances of calcium, chloride, sulfate, and TDS do not have statistical exceedances of metals or the CCR indicator parameter, boron.

In March 2018, as part of the 2018 first semi-annual sampling event, additional parameters, namely, magnesium, sodium, potassium, and alkalinity were analyzed from the landfill cells upgradient wells and from the downgradient wells with statistical exceedances. The geochemical data was used to evaluate if the upgradient (background) and downgradient groundwater had consistent chemical characteristics and if the upgradient wells were geochemically representative of downgradient wells. The data is summarized on **Table 5: Summary of Geochemical Data** and highlights the following.

- The table is color-coded to show the similarities and differences between the geochemical concentrations and wells. The concentrations are ranked from highest to lowest along a column for a single parameter. Higher concentrations are indicated by a darker color while lower concentrations are indicated by lighter color with shadings to indicate the next highest or next lowest concentration.
- The majority of wells indicate a calcium-bicarbonate type groundwater across the three landfill cells; a few wells show sodium-bicarbonate or magnesium-bicarbonate type water; two wells show calcium-sulfate type groundwater and one well exhibits sodium-chloride type groundwater.
- There are differences in groundwater composition between upgradient and downgradient groundwater, particularly at Cells 3 & 4 and Cells 9 & 10, due to variable lithology and groundwater flow. The current statistical methods do not take these geochemical differences into account and may not explain the natural variability for applicable parameters. As additional data are collected semi-annually, the statistical approach currently used may periodically be re-evaluated and adjusted, as necessary.

3.2 Barium at Well GWC-49R

The SSI of barium at GWC-49R is likely the result of natural variation in groundwater quality and not the result of a release from the Landfill Cells 9 & 10. The following information supports this position.

Similar Barium Trend in Upgradient Wells

- GWC-49R barium concentration (0.026 mg/L) is within the range of barium concentrations in overburden and bedrock wells GWC-45/GWC-45R (0.0055 to 0.11 mg/L) detected prior to waste placement in Cells 9 & 10 in November 2015, as shown in **Table 6: Comparisons of Barium, Zinc, and pH**.
- The barium concentration in well GWC-49R is within the range of upgradient well concentrations in March 2020 and historical concentrations in sitewide upgradient wells (**Table 6**). The data is graphically shown in **Figure 2A Barium in Well GWC-49R Compared with Upgradient Wells**.
- Upgradient wells GWA-40 and GWA-41 showed an increase in barium concentrations from September 2019 to March 2020 similar to the increase in well GWC-49R causing an intrawell exceedance and indicated on **Figure 2A**.

Absence of Other Metals in Well GWC-49R Having A Similar Trend as Barium

- The target metals (per Site D&O Plan) in well GWC-49R occur in low concentrations with only barium showing consistently detectable concentrations, but at levels significantly below the Maximum Contaminant Level (MCL) of 2 mg/L. Well GWC-49R has been

analyzed 14 times for barium and 14 times for antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, mercury, selenium, and thallium. Of these metals, only barium had positive detections above the laboratory reporting limit (RL). Other metals were below the RL or present in low concentrations. Only two other metals (antimony and chromium) had more than two detections out of the 14 analyses and are graphed on **Figure 2B: Detected Metal Trends in Well GWC-49R**. A groundwater impact from material placed in Landfill Cells 9 & 10 would show similar detection patterns of other metals. A comparison of the patterns of concentration trends of the detected antimony and chromium with barium in well GWC-49R do not show a correlation between barium and the two detected metals, and there are no increasing trends for antimony and chromium. Statistical analysis of the GWC-49R barium concentrations indicates the trend is not significant.

Barium Is Present in Naturally Occurring Minerals Beneath the Site

- Barium occurs naturally in minerals beneath the Site. Barium occurs naturally in the local geologic formations. The Cartersville mining district in Bartow County contains residual deposits of arsenic-bearing minerals, barite, manganese, and iron oxide minerals along with metal sulfides (Kesler, 1950). Arsenic, barium, copper, lead, nickel, and zinc are found in varying amounts throughout the residual clays of the region due to the weathering of sulfides (Kesler, 1950). The overlying residual clays of the regional carbonate rocks contain deposits of coarsely crystalline barite (Kesler, 1950). Limestones and dolomites can have barium concentrations of 50 to 200 parts per million (Kabata-Pendias, 2001), which could result in naturally occurring concentrations in groundwater at levels similar to those observed at the Site.

3.3 Zinc at Well GWC-47R

The SSI of zinc in well GWC-47R in Landfill Cells 9 & 10 is likely the result of natural variation in groundwater quality and not the result of a release from the Landfill Cells 9 & 10. The following information supports this position.

Similar Zinc Trend in Upgradient Wells

- Zinc concentrations in bedrock well GWC-47R are similar to zinc concentrations before placement of waste in Landfill Cells 9 & 10. The initial waste placement began in November 2015 for Landfill Cells 9 & 10. Current zinc concentration (0.032 mg/L) in well GWC-47R is within the range of zinc concentrations (0.0027 to 0.051 mg/L) detected in bedrock well GWC-45R prior to waste placement, as shown in **Table 6**.
- Zinc concentrations in well GWC-47R are within the range of background concentrations at other landfill cells and are similar to zinc in other Landfill Cells 9 & 10 wells.
- Zinc concentrations in well GWC-47R are comparable to zinc levels in the upgradient wells at other landfill cells onsite, as shown in **Table 6**.

Absence of Other Metals in Well GWC-47R Having A Similar Trend as Zinc

- The target metals (per Site D&O Plan) in well GWC-47R occur in low concentrations. Well GWC-47R has been analyzed 13 times for zinc and 14 times for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, mercury, selenium, and thallium. Copper, nickel, silver, and vanadium have been analyzed 13 times. Metals (antimony, arsenic, barium, chromium, and thallium) which had more than seven detections out of the 13 to 14 analyses were compared against the zinc concentrations and are graphed on **Figure 3: Zinc in Well GWC-47R Compared to Other Metals**. A groundwater impact from the material placed in Cells 9 & 10 would show similar detection patterns of other metals along with the zinc and increasing concentration trends. A comparison of the patterns of concentration trends of the detected antimony, arsenic, barium, chromium, and thallium with zinc in well GWC-47R do not show a correlation between zinc and the other detected metals, and there are no increasing trends for the other metals. Statistical analysis of the GWC-47R zinc concentrations indicates the trend is not significant.

Zinc Is Present in Naturally Occurring Minerals Beneath the Site

- Similar to barium, zinc is found in varying amounts throughout the residual clays from weathering of sulfides in the Cartersville mining district (Kesler, 1950). Zinc chiefly occurs as a sulfide mineral. Limestones and dolomites can have zinc concentrations of 10 to 25 parts per million (Kabata-Pendias, 2001), which could result in naturally occurring concentrations in groundwater at levels similar to those observed at the Site.

3.4 pH at Wells GWC-9 and GWC-49R

The statistical exceedances of pH values in wells GWC-9 and GWC-49R are likely the result of natural variation in groundwater quality and not the result of a release from Landfill Cells 1 & 2 or 9 & 10. The following information supporting this conclusion include.

Similar pH Trend in Upgradient Wells

- The wells with pH statistical excursions are within the range of pH values (4.3 to 10.6 standard units (su)) for sitewide wells during the 14 monitoring events and are similar to pH ranges prior to waste placement in the landfill cells (**Table 6**). The wide pH range is expected in the region characterized by carbonate bedrock and overburden material containing residual clays from weathering of sulfides.
- The pH value for GWC-9 (4.8 su) is just below the lower end of the Landfill Cells 1 & 2 pH prediction limits (5.1 to 7.7 su) and is within the range of 4.3 to 10.6 su noted for sitewide downgradient wells. **Figure 4: Trends in pH for Well GWC-9 and Adjacent Downgradient Wells** shows well GWC-9 pH trend differs from the trends in adjacent downgradient wells GWC-8Z, GWC-8RR, GWC-10, GWC-10R, GWC-11, and GWC-11R. Well GWC-9 pH values are lower, and the trend fluctuates more than the adjacent wells indicating natural variation in groundwater pH due to variable recharge events.

- **Figure 5: Trends in pH for Well GWC-49R and Adjacent Wells** shows well GWC-49R pH trend differs from the trends in adjacent downgradient wells and the trend fluctuates more than the adjacent wells indicating natural variation in groundwater pH.

3.5 Calcium at Wells GWC-5, GWC-6, and GWC-45R

The statistical exceedances of calcium concentrations in wells GWC-5, GWC-6, and GWC-45R are likely the result of natural variation in groundwater quality and not the result of a release from Landfill Cells 1 & 2 and 9 & 10. The following information supporting this conclusion includes:

Similar Calcium Trend in Regional Wells

- Calcium concentrations in wells GWC-5 (12.1 mg/L), GWC-6 (16.2 mg/L), and GWC-45R (43.5 mg/L) exceeded their respective intrawell prediction limits as shown on **Table 1**. However, these concentrations are comparable to regional concentrations of calcium in wells within the Knox Dolomite and Newala Limestone. These concentrations are within the reported concentrations (24 mg/L up to 58 mg/L) in regional bedrock wells (**Appendix A: USGS Regional Data**). The statistical exceedances noted in these wells are due to differences in aquifer lithologies affecting the groundwater chemistry as shown by site-specific data (silty clay and sand with dolomite fragments in wells GWC-5 and GWC-6 to dolostone in well GWC-45R).

Geochemical Difference Between Upgradient and Downgradient Wells

- Site-specific major ion data collected in March 2018 indicate that aquifer lithologies affect the groundwater geochemistry. The March 2018 geochemical data on **Table 5** shows the upgradient overburden wells in Landfill Cells 1 & 2 have a sodium bicarbonate geochemical profile that differs from calcium bicarbonate geochemical profile in downgradient overburden wells. As shown on **Figure 6: Calcium Trends in Wells GWC-5 and GWC-6 Compared to Upgradient Wells**, upgradient wells GWA-2, GWA-2R and GWA-4RZ showed an increase in calcium concentrations from September 2019 to March 2020 similar to the increase in wells GWC-5 and GWC-6 causing an intrawell exceedance. Similar comparison is noted with upgradient wells at Landfill Cells 9 & 10 and well GWC-45R as indicated on (**Figure 7: Calcium Trends in Well GWC-45R Compared to Upgradient Wells**).

3.6 Chloride at Wells GWC-10R, GWC-14Z, and GWC-45R

Reported chloride concentrations in wells GWC-10R, GWC-14Z, and GWC-45R were 3.0 mg/L, 4.2 mg/L, and 4.4 mg/L, respectively. These concentrations slightly exceeded their prediction limits as shown in **Table 1**. The statistical exceedances of chloride at wells GWC-10R, GWC-14Z, and GWC-45R are likely the result of natural variation in groundwater quality and not the result of a release from the Landfill Cells 1 & 2 and 9 & 10. The following information supporting this conclusion include.

Similar Chloride Trend in Regional Wells

- Landfill Cells 1 & 2, 3 & 4, and 9 & 10 were constructed with liner systems to prevent waste materials from leaching into underlying groundwater. in accordance with Solid Waste Permit No. 008-018D (LI). The chloride concentrations in these wells are relatively low, and comparable to regional concentrations (1 to 16 mg/L) in wells screened in Knox Dolomite and Newala Limestone (Croft, 1963).

Similar Chloride Trend in Upgradient Wells

- As shown on **Figure 8: Chloride Trends in Wells GWC-10R and GWC-14Z Compared to Upgradient Wells**, upgradient wells GWA-2 and GWA-4RZ showed an increase in chloride concentrations from September 2019 to March 2020 similar to the increase in wells GWC-10R and GWC-14R causing an interwell exceedance. As shown on **Figure 9: Chloride Trends in Well GWC-45R Compared to Upgradient Wells**, upgradient wells, GWA-40, GWA-41, and GWA-42 showed an increase in chloride concentrations from September 2019 to March 2020 similar to the increase in well GWC-45R causing an intrawell exceedance.
- Chloride exceedances in GWC-45R appear to be affected by recharge effects due to rainfall and groundwater recharge as indicated on **Figure 10: Wells GWC-10R, GWC-14Z, and GWC-45R Chloride and Groundwater Elevations** that show the GWC-45R chloride concentration trend is very similar to the groundwater elevation trend. Higher chloride concentrations have been documented in groundwater during wetter soil moisture conditions than during drier conditions (Peters and Ratcliffe, 1998). Above average rainfall amounts were recorded in early 2020 and during the March 2020 sampling event at the Site which would contribute to these chloride concentrations. The similarity of increases in concentrations in upgradient wells concurrent with increases in downgradient wells and increasing concentrations in response to rising groundwater elevations indicates the chloride in wells GWC-10R, GWC-14Z and GWC-45R are attributed to natural variations in groundwater quality.

3.7 Sulfate at Wells GWC-14Z, GWC-21, and GWC-45R

The statistical exceedances of sulfate at wells GWC-14Z, GWC-21R, and GWC-45R are likely the result of natural variation in groundwater quality and not the result of a release from Landfill Cells 1 & 2, 3 & 4, and 9 & 10. The following information supporting this conclusion include.

Similar Sulfate Trend in Regional Wells

- The sulfate statistical exceedances were reported in downgradient wells GWC-14Z (Cells 1 & 2), GWC-21R (Cells 3 & 4) and GWC-45R (Cells 9 & 10) at 11.1 mg/L, 11.3 mg/L and 5.2 mg/L, respectively. The sulfate concentrations in these wells are relatively low and are comparable to concentrations (ranging from 2 to 14 mg/L) in regional wells screened in Knox Dolomite and Newala Limestone (Croft, 1963).

Similar Sulfate Trend in Upgradient Wells

- The sulfate concentrations in the upgradient wells of Landfill Cells 1 & 2 from February 2016 to March 2020 ranged from 0.36 to 147 mg/L. Well GWC-14Z sulfate concentration of 11.1 mg/L is within this range. **Figure 11: Sulfate Trends in Well GWC-14Z Compared to Upgradient Wells**, showed upgradient wells GWA-2, GWA-2R, and GWA-4RZ had an increases in sulfate concentrations from September 2019 to March 2020 similar to the increase in well GWC-14Z causing an intrawell exceedance.
- The sulfate concentrations in the upgradient wells of Landfill Cells 3 & 4 from February 2016 to March 2020 ranged from 0.31 to 132.46 mg/L. Well GWC-21R sulfate concentration of 11.3 mg/L is within this range (**Figure 12: Sulfate Trends in Well GWC-21R Compared to Upgradient Wells**). Some Cells 3 & 4 upgradient wells also exhibited increases in sulfate concentrations from September 2019 to March 2020 similar to well GWC-21R (**Figure 12**).
- The sulfate concentrations in the upgradient wells of Landfill Cells 9 & 10 from February 2016 to March 2020 ranged from 0.3 to 26 mg/L. Well GWC-45R sulfate concentration of 5.2 mg/L is within this range. (**Figure 13: Sulfate Trends in Well GWC-45R Compared to Upgradient Wells**)
- Sulfate concentrations in wells GWC-14Z, GWC-21R, and GWC-45R are affected by recharge effects due to rainfall and groundwater recharge as indicated on **Figure 14: Sulfate and Groundwater Elevations** that show GWC-14Z and GWC-45R sulfate concentration trend is very similar to the groundwater elevation trend. The similarity of increases in concentrations in upgradient wells concurrent with increases in downgradient wells and increasing concentrations in response to rising groundwater elevations indicates the sulfate in wells GWC-14R, GWC-21R, and GWC-45R are attributed to natural variations in groundwater quality.

3.8 Total Dissolved Solids at Wells GWC-45, GWC-45R, and GWC-48

Total Dissolved Solids (TDS) concentrations of 60.0 mg/L, 245 mg/L and 100 mg/L, respectively, in wells GWC-45, GWC-45R, and GWC-48 exceed their respective intrawell prediction limits as shown on **Table 1**. Variations in TDS concentrations reflect natural variations in groundwater quality at the Site and are not the result of a release from Landfill Cells 9 & 10. The following information supporting this conclusion include.

Similar TDS Trend in Regional Wells

- The TDS statistical exceedances reported in Landfill Cells 9 & 10 downgradient wells GWC-45, GWC-45R, and GWC-48 are relatively low, and are comparable to concentrations (ranging from 112 to 337 mg/L) in regional wells screened in Knox Dolomite and Newala Limestone (Croft, 1963).

Similar TDS Trend in Upgradient Wells

- The TDS concentrations in the upgradient wells of Landfill Cells 9 & 10 from February 2016 to March 2020 ranged from 18.0 to 249 mg/L. TDS concentration of GWC-45, GWC-45R, and GWC-48 are within this range. (**Figure 15: TDS in Wells GWC-45, GWC-45R, and GWC-48 Compared to Upgradient Wells**). Landfill Cells 9 & 10 upgradient wells also exhibited increases in TDS concentrations from September 2019 to March 2020 similar to wells GWC-45, GWC-45R, and GWC-48 (**Figure 15**).
- TDS concentrations in wells GWC-45, GWC-45R, and GWC-48 are affected by recharge as indicated on **Figure 16: TDS and Groundwater Elevations** that show GWC-45, GWC-45R, and GWC-48 TDS concentration trend is very similar to the groundwater elevation trend. The similarity of increases in concentrations in upgradient wells concurrent with increases in downgradient wells and increasing concentrations in response to rising groundwater elevations indicates the TDS in wells GWC-45, GWC-45R, and GWC-48 are attributed to natural variations in groundwater quality.

4.0 CONCLUSIONS AND RECOMMENDATIONS

This ASD has been prepared in response to apparent SSIs presented in the *2020 Semi-Annual Groundwater Monitoring & Corrective Action Report*, Georgia Power Company Plant Bowen Cells 1 & 2, 3 & 4, and 9 & 10, dated August 31, 2020, for specific wells that had not previously been addressed in past ASDs, although the constituents themselves have been addressed in past ASDs. Based on the information presented herein, which is similar to the rationale presented for these constituents in previous ASDs, alternate sources were identified for the statistical exceedances for each of the following wells and constituents.

Constituent	Wells with Constituent Concentrations Above Statistical Prediction Limits
Barium	GWC-49R
Zinc	GWC-47R
pH	GWC-9, GWC-49R
Calcium	GWC-5, GWC-6, GWC-45R
Chloride	GWC-10R, GWC-14Z, GWC-45R
Sulfate	GWC-14Z, GWC-21R, GWC-45R
Total Dissolved Solids	GWC-45, GWC-45R, GWC-48

As outlined in Section 3, the statistical exceedances are due to variability in the groundwater quality and are not an indication of a release from the lined Landfill Cells 1 & 2, 3 & 4, and 9 & 10. The locations have met the requirements for a demonstration listed in 391-3-4.14.23(c). Therefore, the locations should remain in CCR detection monitoring at this time. Detection monitoring results and D&O Plan target metals results should continue to be presented in the subsequent semi-annual groundwater monitoring reports.

Notes:

UP = Upgradient well (background well)

DOWN = Downgradient well

OB = overburden water unit

ROCK = bedrock water unit

Data shown is from the March 2018 sampling event

The table is color-coded to show similarities and differences. The colors depict a ranking of the concentrations from highest to lowest along a column for a single parameter.

The highest concentrations are shown in dark red and the lowest concentration are shown in dark green with the concentrations between the highest and lowest shown in yellow.

Lighter shadings of red, green, and yellow indicate the next highest or next lowest concentration.

**TABLE 6
COMPARISONS OF BARIUM, ZINC, AND pH**

Barium Concentrations in Well GWC-49R	Barium Concentrations Prior to Waste Placement in Cells 9 & 10 in November 2015	Barium Concentrations in Cell 9 & 10 Upgradient Wells	Barium Concentrations in Sitewide Upgradient Wells
GWC-49R March 2020: 0.026 mg/L	August 2007 to October 2015 in Bedrock Well GWC-45R: 0.013 to 0.025 mg/L	March 2016 to March 2020 Bedrock Wells: 0.0069 to 0.0462 mg/L	March 2016 to March 2020 Bedrock Wells: 0.0048 to 0.053 mg/L
