

**Plant Wansley CCR Landfill**  
PERMIT #: 074-005D(LI)  
Heard County

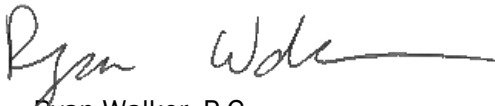

**2022 ANNUAL GROUNDWATER MONITORING AND  
CORRECTIVE ACTION REPORT**

## PROFESSIONAL CERTIFICATION

This *2022 Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Company – Plant Wansley Landfill* has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residuals Rule [40 Code of Federal Regulations (CFR) 257 Subpart D] and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 and 391-3-4-.14 by a qualified groundwater scientist or engineer with Atlantic Coast Consulting, Inc. (ACC). I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management and 40 CFR Part 258.50(g).

## ATLANTIC COAST CONSULTING, INC.

Senior Professional Engineer  
Date: January 31, 2023

## SUMMARY

This summary of the *2022 Annual Groundwater Monitoring and Corrective Action Report* provides the groundwater monitoring and corrective action program status from January through December 2022 for Georgia Power Company (Georgia Power) Plant Wansley Coal Combustion Residuals (CCR) Landfill (Site). This summary was prepared by Atlantic Coast Consulting, Inc. (ACC) on behalf of Georgia Power to meet the requirements listed in Part A, Section 6<sup>1</sup> of the United States Environmental Protection Agency (US EPA) CCR Rule [40 Code of Federal Regulations (CFR) 257 Subpart D].

Plant Wansley is located at 1371 Liberty Church Road, approximately 12 miles southeast of the City of Carrollton. The Site is located on the southern portion of the Plant Wansley property. As part of the 2022 Integrated Resource Plan, the Georgia Public Service Commission approved decertification and retirement of the Plant Wansley Coal fired units on August 31, 2022.

The groundwater monitoring system is comprised of a comprehensive network of wells installed to meet federal and state monitoring requirements. Routine sampling and reporting began after background groundwater conditions were established between August 2011 and July 2013 in accordance with the Solid Waste Permit (074-005D(LI)) requirements specified in the Design and Operation (D&O)

Plan that existed at that time. EPD issued CCR Permit No. 074-005D (CCR) on December 8, 2022, which replaces the former solid waste permit. Future routine groundwater monitoring and reporting will be conducted at the site pursuant to the Groundwater Monitoring Plan in the new permit. The monitoring program has been modified to include Appendix III parameters<sup>2</sup> to meet the requirements of 40 CFR § 257.90 through § 257.95. Background groundwater conditions for Appendix III and IV parameters<sup>3</sup> were established between May 2016 and August 2017. Alternate Source Demonstrations (ASDs) completed in 2017-2022 have presented evidence demonstrating that statistically significant increases (SSIs) in groundwater are not due to a release from the unit. During the 2022 annual reporting period, the Site remained in detection monitoring.

Plant Wansley and Plant Wansley Landfill

---

<sup>1</sup> 80 FR 21468, Apr. 17, 2015, as amended at 81 FR 51807, Aug. 5, 2016; 83 FR 36452, July 30, 2018; 85 FR 53561, Aug. 28, 2020

<sup>2</sup> Boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS)

<sup>3</sup> Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, fluoride, lead, lithium, mercury, molybdenum, selenium, thallium, and radium 226+228

During the 2022 annual reporting period, ACC conducted groundwater sampling events in March and August 2022. Groundwater samples were submitted to Eurofins Environment Testing America for analysis. Per the CCR Rule, the groundwater results were evaluated in accordance with the certified statistical methods. That evaluation showed SSIs of Appendix III parameters in wells provided in the table below.

<b>Appendix III Parameter</b>	<b>March 2022</b>	<b>August 2022</b>
Boron	GWC-14, GWC-15	GWC-12, GWC-14
Chloride	GWC-14	GWC-14

Except for the boron SSI in GWC-12 during the August monitoring period, SSIs confirmed during the current monitoring period are either addressed by previous ASDs or a revised ASD addendum included in an appendix of this report. Based on review of the Appendix III statistical results completed for the groundwater monitoring and corrective action program from January through December 2022, the Site will remain in detection monitoring pending evaluation of the recent SSI. Georgia Power will continue detection groundwater monitoring and reporting at the Site. Reports will be posted to Georgia Power's website and provided to the Georgia Environmental Protection Division (EPD) semiannually.

## 1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (US EPA) Coal Combustion Residuals (CCR) Rule [40 Code of Federal Regulations (CFR) 257 Subpart D] and the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management 391-3-4-.10, Atlantic Coast Consulting, Inc. (ACC) has prepared this *2022 Annual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted at the Site. Semiannual monitoring and reporting for the CCR Unit are performed in accordance with the monitoring requirements of 40 CFR § 257.90 through § 257.95 of the Federal CCR Rule and Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a).

Groundwater monitoring during the 2022 monitoring period was performed in accordance with the Solid Waste Permit requirements specified in the Design and Operation (D&O) Plan (Georgia Power, 2010). A 2017 minor modification to the previous permit approved the addition of Appendix III and IV parameters contained in 40 CFR § 257 Subpart D to the groundwater monitoring plan in the permit. EPD issued CCR Permit No. 074-005D (CCR) on December 8, 2022, which replaces Georgia Solid Waste Permit No. 074-005D(LI). Moving forward, routine groundwater monitoring and reporting will be conducted at the Site pursuant to the Groundwater Monitoring Plan in the new permit. This report provides the results of the sampling events conducted in March 2022 and August 2022 and includes results for: (1) a list of modified constituents derived from Appendix I of 40 CFR § 258 included in the D&O Plan in the permit; and (2) CCR detection monitoring sampling event for 40 CFR § 257 Appendix III constituents.

This document serves as the *2022 Annual Groundwater Monitoring and Corrective Action Report* in accordance with 391-3-4-.10(6)(a) and 40 CFR § 257.90(e). For ease of reference when discussing aspects of the CCR Rule, only the US EPA CCR rules are cited within this report.

### 1.1 Site Description and Background

Plant Wansley is located in northeast Heard County and southeast Carroll County, Georgia, at 1371 Liberty Church Road, approximately 12 miles southeast of the City of Carrollton. The plant property encompasses approximately 5,100 acres and is bounded on the east by the Chattahoochee River (Figure 1, Site Map). As part of the 2022 Integrated Resource Plan, the Georgia Public Service Commission approved decertification and retirement of the Plant Wansley coal-fired units by August 31, 2022. The Site is located on the property south of the plant. The Site is composed of three cells within an approximate 73-acre disposal footprint. Each cell of the Plant Wansley Landfill is lined with a 60-mil thick high-density polyethylene (HDPE) liner underlain by a geosynthetic clay liner (GCL), a 2-foot compacted clay layer [maximum hydraulic conductivity of  $1 \times 10^{-5}$  centimeters per second (cm/sec)], and structural fill. A leachate collection and removal system overlies the liner system to remove liquids and reduce head pressure on the liner.

Routine groundwater sampling and reporting began after background groundwater conditions were established between August 2011 and July 2013, prior to placement of waste, in accordance with the Solid Waste Permit requirements specified in the D&O Plan that existed at that time. The monitoring program has been modified to include Appendix III parameters to meet the requirements of 40 CFR § 257.90 through § 257.95. Background groundwater conditions for Appendix III and IV parameters were established between May 2016 and August 2017.

## 1.2 Regional Geology and Hydrogeologic Setting

The Site is located in the Piedmont physiographic province of Georgia characterized by low, linear ridges separated by broad, open valleys trending northeast-southwest. The Piedmont contains predominately metamorphic rock of Precambrian to Paleozoic age. Over geologic time the Piedmont has experienced multiple events of uplift, folding and faulting, alternation, and erosion.

Soils in the Piedmont formed mostly from the in-place weathering of the underlying crystalline bedrock. Near the ground surface, the soils are silt- and clay-rich. Sand and fine sand become more prominent with depth. Furthermore, with increasing depth the weathered materials tend to retain details of the structural features of the underlying bedrock.

The Site is situated on several bedrock types composed of schist, gneiss, quartzite, and amphibolite identified in boring logs (Golder, 2018). Residual soils are primarily sandy silt, silty sand, sandy clay, and silty clay which overlie bedrock across the site. Saprolitic soils were described at variable thickness across the Site but were generally encountered at or near ground surface.

Groundwater occurs across the Site in the overburden soils, as well as in the underlying and hydraulically connected bedrock. Recharge to the bedrock originates from groundwater stored in low permeability, high porosity, clay- and silt-rich overburden material. Infiltration of groundwater through overburden material to bedrock occurs in areas of enhanced permeability (i.e., areas of high fracture density). The water table surface at the Site is a subdued mimic of the topography. Top of the rock surface generally follows topography and likely controls groundwater flow direction in the uppermost aquifer as well. Groundwater flow across the Site is generally to the east and northeast.

## 1.3 Groundwater Monitoring Well Network

A groundwater monitoring system was installed within the uppermost aquifer at the Site. The monitoring system is designed to monitor groundwater passing the waste boundary of the CCR Unit within the uppermost aquifer. Figure 2, Well Location Map, shows the monitoring well locations (Table 1, Monitoring Network Well Summary). Wells were located to serve as upgradient and downgradient monitoring points, based on groundwater flow direction (Figures 3A and 3B, Potentiometric Contour Map – March 2022 and August 2022).

## 2.0 GROUNDWATER MONITORING ACTIVITIES

Pursuant to 40 CFR § 257.90(e), the following describes monitoring-related activities performed during the annual monitoring period. There are no changes in the status of the monitoring program. All groundwater sampling was performed in accordance with 40 CFR § 257.93. Samples were collected in March and August 2022 from each well in the certified monitoring system shown on Figure 2.

### 2.1 Monitoring Well Installation and Maintenance

There was no change to the groundwater monitoring system during the reporting period; the network remained the same as in the previous reporting year, i.e., 2021. Monitoring wells are inspected semiannually to determine if any repairs or corrective actions are necessary to meet the requirements of the Georgia Water Well Standards Act (O.C.G.A. § 12-5-134(5)(d)(vii)). In March and August 2022, monitoring wells were inspected, and routine maintenance was

performed as needed. Well inspection checklists completed during the reporting period are included in Appendix A, Laboratory Analytical and Field Sampling Reports. No repairs were conducted during the monitoring period. These well inspections were performed under the direction of a professional geologist or engineer registered in the State of Georgia.

## 2.2 Detection Monitoring Program

Detection monitoring is performed on a semiannual basis in accordance with the approved Georgia EPD Solid Waste Permit and the Site's D&O Plan. The semiannual sampling events were conducted in March and August 2022. A summary of groundwater sampling events completed during the reporting period is provided in Table 2, Groundwater Sampling Event Summary.

Groundwater samples from wells in the detection monitoring system were collected from each monitoring well and analyzed for:

- A state-modified Appendix I list of detection parameters according to Georgia EPD Rules for Solid Waste Management 391-3-4-.14 and the approved Georgia EPD Solid Waste Permit [No. 074-005D(LI)]. The state-modified Appendix I analyte list includes antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc.
- Appendix III constituents according to 40 CFR § 257.94(a).

The analytes required by Appendix I and Appendix III are summarized in Table 3, Summary of Groundwater Monitoring Parameters. Copies of the analytical data packages for the semiannual detection monitoring events are included in Appendix A.

## 2.3 Additional Sampling

Surface water samples were collected from SWA-1, SWA-6, SWC-5, SWC-7, and SWC-8 during the March 2022 event and from SWA-1, SWA-6, SWC-3, SWC-5, and SWC-7 during the August 2022 event. Locations SWC-2, SWC-3, SWC-4, and SWC-9 were dry at the time of sampling in March 2022, and SWC-2, SWC-4, SWC-8, and SWC-9 were dry at the time of sampling in August 2022.

Due to reduced plant operation, flue gas desulfurization (FGD) equipment Units 1 and 2 were not in operation at the time of sampling during the March or August 2022 events; therefore, no effluent samples were collected. Moving forward, effluent samples will not be collected as plant FGD operations have been discontinued. Field parameter logs and laboratory analytical reports for surface water samples collected during the March and August 2022 monitoring events are included in Appendix A.

Due to anomalous results for boron in GWC-12 and GWC-15, mercury in GWC-14, and zinc in GWC-33, as well as potential quality control issues identified for boron (GWC-12, GWC-14, GWC-15), vanadium (GWC-17, GWC-19, GWC-22, GWC-31), and zinc (GWC-14 and GWC-33) during data validation of the March 2022 event, these wells were resampled in May 2022. An additional evaluation of the GWC-15 result was conducted by a resample event in June 2022. Due to an anomalous result for zinc in GWC-9 during the August 2022 event, this well was resampled in October 2022. Due to an anomalous result for boron in GWC-12 during the August 2022 event, this well was resampled in November 2022. The May 2022, June 2022, October 2022, and November 2022 resample results are presented in Appendix A.

### 3.0 SAMPLE METHODOLOGY AND ANALYSIS

The following sections describe the methods used to conduct groundwater monitoring at the Site during the semiannual monitoring period.

#### 3.1 Groundwater Flow Direction, Gradient, and Velocity

Prior to sampling, groundwater elevations were recorded from each well in the network at the Site. Groundwater elevations recorded during the monitoring events are summarized in Tables 4A and 4B, Summary of Groundwater Elevations – March 2022 and August 2022, respectively. Groundwater elevation data were used to develop Figures 3A and 3B, respectively. As shown on Figures 3A and 3B, groundwater flows semi-radially from topographic highs near GWA-2 and GWA-28. Across the entire Site, groundwater generally flows to the east. The groundwater flow patterns observed during the monitoring events are consistent with historical patterns.

The horizontal groundwater flow velocity at the Site was calculated using a derivation of Darcy's Law. Specifically:

##### Equation

$$v = \frac{K (dh/dl)}{P_e} \quad \text{where:}$$

$v$  = groundwater velocity  
 $K$  = hydraulic conductivity  
 $dh/dl$  = hydraulic gradient  
 $P_e$  = effective porosity

Groundwater flow velocities were calculated for the Site based on hydraulic gradients, average hydraulic conductivity based on previous slug test data, and an estimated effective porosity of 0.10 (SCS, 2007). The groundwater flow velocity has been calculated and is tabulated on Tables 5A and 5B, Horizontal Groundwater Flow Velocity Calculations – March 2022 and August 2022, respectively. The calculated flow velocity was approximately 0.46 feet per day during the March 2022 event and 0.48 feet per day during the August 2022 event. Calculated groundwater velocities across the Site are generally consistent with historical calculations and site-specific geology; therefore, confirming the groundwater monitoring network as properly located to monitor the uppermost aquifer.

#### 3.2 Groundwater Sampling

Groundwater samples were collected using low-flow sampling procedures in accordance with 40 CFR § 257.93(a) and the D&O Plan. Purging and sampling was performed using either a peristaltic pump, dedicated QED bladder pump, or non-dedicated QED bladder pump. Pump intakes were located at the midpoint of the well screen (or as appropriate determined by the water level). Any non-disposable equipment was decontaminated before use and between well locations using procedures described in the latest version of the Region 4 US EPA Lab Services and Applied Science Division (LSASD) Field Equipment Cleaning and Decontamination as a guide (US EPA, 2020).

Monitoring wells were purged and sampled using low-flow sampling procedures. An Aqua Troll (In-Situ field instrument) was used to monitor and record field water quality parameters (pH, specific conductance, oxidation-reduction potential [ORP], dissolved oxygen [DO], and temperature) during well purging prior to sampling. Turbidity was measured using a Hach 2100Q portable turbidimeter. Groundwater samples were collected when the following stabilization criteria were met:

- $\pm 0.1$  standard units for pH
- $\pm 5\%$  for specific conductance
- $\pm 10\%$  for DO, or 0.2 milligrams per liter (mg/L), whichever is greater. No criterion applies if DO < 0.5 mg/L
- Turbidity measurements less than 5 nephelometric turbidity units (NTU)

Once stabilization was achieved, samples were collected directly into appropriately preserved laboratory-supplied sample containers. Sample bottles were placed in ice-packed coolers and submitted to Eurofins Environment Testing America (Eurofins) of Savannah, Georgia following chain-of-custody protocol. Stabilization logs for each well during the monitoring event are included in Appendix A.

### 3.3 Laboratory Analyses

Laboratory analyses were performed by Eurofins. Eurofins is accredited by the National Environmental Laboratory Accreditation Program (NELAP) and maintains a NELAP certification for the parameters analyzed for this project. In addition, Eurofins is certified to perform analysis by the State of Georgia. Analytical results from the March 2022 and August 2022 events are summarized in Tables 6A and 6B, Summary of Groundwater Analytical Data – March 2022 and August 2022, respectively. Surface water analytical results are presented in Tables 7A and 7B, Summary of Surface Water Analytical Data – March 2022 and August 2022, respectively. Analytical methods used for groundwater monitoring parameters, chain-of-custody records, and analytical results are provided in laboratory reports in Appendix A.

### 3.4 Quality Assurance and Quality Control

During each sampling event, quality assurance/quality control (QA/QC) samples are collected at a rate of one set per every 10 detection samples. Equipment blanks (where non-dedicated sampling equipment is used) and duplicate samples were collected during each sampling event. QA/QC sample data were evaluated during data validation and are included in Appendix A.

Groundwater quality data in this report were validated in accordance with US EPA guidance (US EPA, 2011) and the analytical methods. Data validation generally consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spike/matrix spike duplicate recoveries and relative percent differences (RPDs), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits (RLs). Where appropriate, validation qualifiers and flags are applied to the data using US EPA procedures as guidance (US EPA, 2017). Data validation summaries are included in Appendix A.

Values followed by a "J" flag in Tables 6A, 6B, 7A, and 7B indicate that the result is an estimated analyte concentration detected between the method detection limit (MDL) and the laboratory RL. The estimated value is positively identified but is below the lowest level that can be reliably achieved within specified limits of precision and accuracy under routine laboratory operating conditions. "J" flagged data are used to establish background statistical limits but are not used when performing statistical analyses or calculating RPDs. The data are considered usable for meeting project objectives and the results are considered valid.

## 4.0 STATISTICAL ANALYSIS

The statistical method used at the Site was developed by Groundwater Stats Consulting, LLC (GSC), using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, US EPA 530/ R-09-007 (US EPA, 2009).

A permit minor modification was submitted to Georgia EPD following submittal of the *2019 First Semiannual Groundwater Monitoring Report* to allow for intrawell methods to be used for Appendix I analytes. The statistical methodology was revised to an intrawell method following the June 2019 monitoring event.

On February 26, 2021, Georgia Power submitted a minor modification to implement a two-step statistical approach for the detection monitoring program to address initial statistically significant increases (SSIs) over background for constituents currently using the intrawell statistical approach. In a letter dated November 3, 2021, Georgia EPD approved this approach. The two-step analysis is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine “background” [US EPA Unified Guidance (2009), Chapter 7, Section 7.5].

Statistical analysis of March 2022 and August 2022 groundwater monitoring data was performed by GSC following the appropriate certified statistical methodology for the Site and in accordance with minor modifications submitted to Georgia EPD in 2019 and 2021. A summary of the statistical methodology used at the Site for routine groundwater monitoring is provided in Table 8, Statistical Method Summary. Statistical analysis methods and results are provided in Appendix B, Statistical Analysis Reports. The methods and results are summarized in the following sections.

### 4.1 Appendix I and III Constituents Methods

To develop the statistical methods, analytical data collected during the background period were evaluated and used to develop statistical limits for each Appendix I and III parameter. Sanitas groundwater statistical software was used to screen the data and perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by US EPA regulations.

Interwell prediction limits (PLs) pool upgradient well data to establish a background limit for an individual constituent, and the most recent sample from each downgradient well is compared to the same limit for each parameter. Intrawell PLs are constructed from historical data within a given well, and the most recent sample is compared to background.

Statistical tests used to evaluate Appendix I groundwater monitoring data consist of intrawell PLs combined with a 1-of-2 verification resample plan for the permit-required Appendix I parameters, except for barium at GWC-14. The occurrence of barium at GWC-14 was previously addressed in an alternate source demonstration (ASD) [ACC, 2020] submitted to EPD, and historical results for this parameter are elevated compared to background; therefore, it is evaluated by trend tests in lieu of prediction limits.

Statistical tests used to evaluate Appendix III groundwater monitoring data consist of interwell PLs combined with a 1-of-2 verification resample plan for parameters boron, calcium, chloride, and fluoride. Monitoring results for pH, sulfate, and total dissolved solids (TDS) were evaluated using intrawell PLs combined with a 1-of-2 verification resample plan.

Intrawell statistical methods are a conservative first step that may be overly sensitive to natural variation, particularly for nonparametric limits with small background sample sizes. Therefore, in instances where an apparent Appendix I or III SSI is identified by intrawell statistical methods, interwell statistical methods may be used as a reasonable second step to determine sitewide background.

If data from a sampling event initially exceeds the PL, the resampling strategy may be used to verify the result. In 1-of-2 resampling, one independent resample may be collected and evaluated within 90 days to determine whether the initial exceedance is verified. If the resample exceeds the PL, the initial exceedance is verified, and an SSI is identified. When a resample result does not verify the initial result, and does not exceed the PL, there is no SSI. If resampling is not performed, the initial exceedance is a confirmed SSI. In 1-of-2 resampling, one independent resample may be collected and evaluated within 90 days to determine whether the initial exceedance is verified. If a resample exceeds the PL, the initial exceedance is verified, and an SSI is identified. When a resample result does not verify the initial result, and does not exceed the PL, there is no SSI. If resampling is not performed, the initial exceedance is a confirmed SSI.

## **4.2 Statistical Analyses Results for Appendix I Parameters**

### **4.2.1 Summary of Appendix I Results for March 2022**

Analytical data from the monitoring event in March 2022 were statistically analyzed in accordance with the statistical methods. The statistical analysis and comparison to PLs are included in Appendix B.

Based on the statistical results presented in Appendix B, evaluation of parameters exhibiting initial exceedances of the intrawell statistical analysis and additional evaluation by interwell statistical analysis identified unverified exceedances for mercury in the sample from GWC-14 and zinc in the sample from GWC-33. However, these results were not verified during the May verification event. Barium in the sample from GWC-14 has been identified as a significant upward trend; however, the occurrence of barium in groundwater at GWC-14 is not the result of a release from the unit but rather is attributed to a previous failure in the return water piping in 2014 which was subsequently repaired as demonstrated in the 2020 ASD. Therefore, there were no SSIs identified for Appendix I parameters.

### **4.2.2 Summary of Appendix I Results for August 2022**

Analytical data from the monitoring event in August 2022 were statistically analyzed in accordance with the statistical methods. The statistical analysis and comparison to PLs are included in Appendix B.

Based on the statistical results presented in Appendix B, evaluation of parameters exhibiting initial exceedances of the intrawell statistical analysis and additional evaluation by interwell statistical analysis identified unverified exceedances for nickel and zinc in the sample from GWC-9. However, the zinc result was not verified during the October verification event, and the nickel result has been addressed by a previous ASD. Barium in the sample from GWC-14 has been identified as a significant upward trend. As described in Section 4.2.1, barium in groundwater at GWC-14 is not the result of a release from the unit. Therefore, there were no SSIs identified for Appendix I parameters not previously addressed by an ASD.

## 4.3 Statistical Analyses Results for Appendix III Parameters

### 4.3.1 Summary of Appendix III Results for March 2022

Analytical data from the monitoring event in March 2022 were statistically analyzed in accordance with the statistical methods. The statistical analysis and comparison to PLs are included in Appendix B.

Based on the statistical results presented in Appendix B, the evaluation of parameters exhibiting initial exceedances of the interwell statistical analysis identified unverified SSIs for boron in the samples from GWC-12 and GWC-15 in the March 2022 monitoring event. However, only the boron result reported from GWC-15 during the May verification event constituted a verified statistical exceedance. Therefore, the verified exceedances identified during the March 2022 event included:

- Boron: GWC-14 and GWC-15
- Chloride: GWC-14

The boron SSIs identified for GWC-14 and GWC-15 are consistent with conditions outlined by an ASD completed in April 2018 (ACC, 2018) for GWC-14. The conditions outlined in the April 2018 ASD are still present and were further evaluated in an update to the ASD to include GWC-15, and is provided as Appendix C, Alternate Source Demonstration. The current chloride SSI for GWC-14 is also addressed by the April 2018 ASD and current update. The update to the April 2018 ASD as well as the original April 2018 ASD were approved by EPD in October 2022.

### 4.3.2 Summary of Appendix III Results for August 2022

Analytical data from the monitoring event in August 2022 were statistically analyzed in accordance with the statistical methods. The statistical analysis and comparison to PLs are included in Appendix B.

Based on the statistical results presented in Appendix B, the evaluation of parameters exhibiting initial exceedances of the interwell statistical analysis identified a verified exceedance for boron in the sample from GWC-12 in the August 2022 monitoring event and verified SSIs for boron and chloride in GWC-14. Therefore, the exceedances identified during this event include:

- Boron: GWC-12 and GWC-14
- Chloride: GWC-14

The boron SSIs identified for GWC-14 are consistent with conditions outlined by an ASD completed in April 2018 (ACC, 2018) for GWC-14. The conditions outlined in the April 2018 ASD are still present and are further evaluated in an update to the ASD provided as Appendix C. Due to the boron SSI identified for GWC-12, the Site will remain in detection monitoring pending evaluation of the recent SSI.

## 5.0 ALTERNATE SOURCE DEMONSTRATIONS

ASDs were previously submitted to Georgia EPD under separate report covers to address SSIs of Appendix I and Appendix III parameters. Based on Georgia EPD guidance, ASDs no longer require concurrence if an SSI has not been detected for two consecutive events, which indicates natural

variability. SSIs confirmed during this reporting period have been addressed by a previous March 2017 ASD and an August 2022 update to the April 2018 ASD, both of which have been approved by EPD, as listed in the table below. The SSIs at GWC-14 and GWC-15, which occurred during this reporting period, were further addressed by an August 2022 update to the April 2018 ASD and included as Appendix C.

Reference	SSI(s)	Well(s)	Status
Southern Company Services, Inc. Alternate Source Demonstration for Plant Wansley Disposal Facility Groundwater Monitoring Network, March 2017	nickel	GWC-9	Approved July 5, 2017
Atlantic Coast Consulting, Inc., Alternate Source Demonstration – Plant Wansley CCR Landfill, April 2020	barium	GWC-14	Submitted April 15, 2020
Atlantic Coast Consulting, Inc., Alternate Source Demonstration – Plant Wansley CCR Landfill, April 2018, updated August 2022.	boron	GWC-14	Approved October 19, 2022
	chloride	GWC-14	
	boron	GWC-15	

## 6.0 MONITORING PROGRAM STATUS

The Site is currently in detection monitoring. An SSI of an Appendix III parameter has been identified. In accordance with 40 CFR § 257.94(e) and § 257.95 and Georgia’s Solid Waste Management Rule 391-3-4-.10, the Site will remain in detection monitoring pending evaluation of the recent SSI at GWC-12. Other verified SSIs for Appendix III parameters were addressed by previous ASDs or are addressed by an update to a 2018 ASD included as Appendix C.

## 7.0 CONCLUSIONS AND FUTURE ACTIONS

This *2022 Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Company – Plant Wansley CCR Landfill* was prepared to fulfill the requirements of both applicable federal and state CCR Rules and Georgia EPD Solid Waste Management Rules (40 CFR § 257.90(e), 391-3-4-.10, and 391-3-4-.14). Statistical evaluations of the groundwater monitoring data for the Site identified SSIs of Appendix III groundwater monitoring parameters. Georgia Power will evaluate an ASD for the recently verified SSI of boron at GWC-12. Other verified SSIs have been addressed by ASDs or are addressed by an update to a 2018 ASD included as Appendix C, and the Site remains in detection monitoring.

The next semiannual monitoring event is tentatively scheduled for February 2023.

Notes:

1. ft BTOC indicates feet below top of casing.
2. ft NAVD88 indicates feet North American Vertical Datum of 1988.
3. Depths to water measured August 8, 2022.

**Table 5A**  
**Horizontal Groundwater Flow Velocity Calculations**  
**March 2022**  
**Plant Wansley CCR Landfill**  
**Heard County**

Equation

$$v = \frac{K (dh/dl)}{P_e} \quad \text{where: } v = \text{groundwater velocity}$$

K = hydraulic conductivity  
dh/dl = hydraulic gradient  
P<sub>e</sub> = effective porosity

Values Used in Calculation

Value		Source
K =	4.1E-04 cm/sec 1.16 ft/day	See note 1.
dh/dl <sub>1</sub> =	16.86/439 ft/ft 0.038 unitless	from GWA-4 to GWC-5
dh/dl <sub>2</sub> =	66.89/1458 ft/ft 0.046 unitless	from GWA-1 to GWC-19
dh/dl <sub>3</sub> =	91.96/2594 ft/ft 0.035 unitless	from GWA-2 to GWC-16
dh/dl <sub>avg</sub> =	0.040 unitless	Average (i <sub>1</sub> , i <sub>2</sub> , i <sub>3</sub> )
P <sub>e</sub> =	0.10 unitless	See note 1.

Calculation

$$v = \frac{(1.16)(0.04)}{0.10} \quad v = 0.46 \text{ ft/day}$$

Notes:

1. Results for parameters are reported in milligrams per liter (mg/L). pH results are reported in Standard Units.
2. < indicates the parameter was not detected above the relevant laboratory method detection limit (MDL).
3. J indicates the parameter was detected at such low levels that the precision of the laboratory instrument could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated value.
4. TDS indicates total dissolved solids.
5. Appendix III = indicator parameters evaluated during Detection Monitoring per 40 CFR § 257.94(a).
6. Parameters required by permit are Appendix I parameters included to meet EPD Rule 391-3-4-.14 requirements.
7. -- indicates parameter not analyzed during resample event.
8. Verification sampling was performed for select parameters in GWC-12, GWC-14, GWC-15, GWC-17, GWC-19, GWC-22, GWC-31, and GWC-33.

Notes:

1. Results for parameters are reported in milligrams per liter (mg/L). pH results are reported in Standard Units.
2. < indicates the parameter was not detected above the relevant laboratory method detection limit (MDL).
3. J indicates the parameter was detected at such low levels that the precision of the laboratory instrument could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated value.
4. TDS indicates total dissolved solids.
5. Appendix III = indicator parameters evaluated during Detection Monitoring per 40 CFR § 257.94(a).
6. Parameters required by permit are Appendix I parameters included to meet EPD Rule 391-3-4-.14 requirements.
7. -- indicates parameter not analyzed during resample event.
8. Verification sampling was performed for select parameters in GWC-12, GWC-14, GWC-15, GWC-17, GWC-19, GWC-22, GWC-31, and GWC-33.

Notes:

1. Results for parameters are reported in milligrams per liter (mg/L). pH results are reported in Standard Units.
2. < indicates the parameter was not detected above the relevant laboratory method detection limit (MDL).
3. J indicates the parameter was detected at such low levels that the precision of the laboratory instrument could not produce a reliable value. Therefore, the value displayed (value J) is qualified by the laboratory as an estimated value.
4. TDS indicates total dissolved solids.
5. Appendix III = indicator parameters evaluated during Detection Monitoring per 40 CFR § 257.94(a).
6. Parameters required by permit are Appendix I parameters included to meet EPD Rule 391-3-4-.14 requirements.
7. Verification sampling was performed for zinc in GWC-9 and boron in GWC-12.
8. -- indicates parameter not analyzed during verification event.

**Table 8  
Statistical Method Summary  
Plant Wansley CCR Landfill  
Heard County**

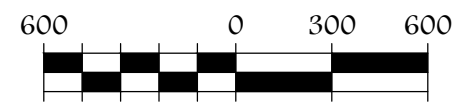

Plant Wansley CCR Landfill Statistical Method Summary		
Monitoring Well Network	Upgradient Wells	GWA-1, GWA-2, GWA-3, GWA-4, GWA-28, and GWA-29
	Downgradient Wells	GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-18, GWC-19, GWC-20, GWC-21, GWC-22, GWC-23, GWC-24, GWC-25, GWC-26, GWC-27, GWC-30, GWC-31, GWC-32, GWC-33, GWC-34, and GWC-35
CCR Monitoring Parameters	Appendix III (Detection Monitoring)	Boron, Calcium, Chloride, Fluoride, pH, Sulfate, and TDS
	Appendix IV (Assessment Monitoring)	Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Combined Radium 226 + 228, Fluoride, Lead, Lithium, Mercury, Molybdenum, Selenium, and Thallium
Modified Appendix I Parameters	Detection Monitoring	Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Lead, Mercury, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc
Statistical Methodology	Data Screening Proposed Background	Evaluate outliers, trends, and seasonality when sufficient data are available
	Statistical Limits	Interwell (boron, calcium, chloride, and fluoride) or intrawell (pH, sulfate, TDS, and EPD Permit Metals) statistical limits are on constituent specific basis, depending on the appropriateness of the method as determined by the Analysis of Variance. Intrawell exceedances are further evaluated by interwell analysis per the two-step statistical method.

	GROUNDWATER FLOW DIRECTION

NOTE:

1. SURFACE WATER MONITORING POINTS SWC-2, SWC-3, SWC-4, SWC-5, SWC-8, AND SWC-9 ARE UNDERDRAIN SAMPLING LOCATIONS.
2. AERIAL DATED 9/9/2022 FROM SAM, LLC. ADDITIONAL PHOTOGRAPHY DATED 2022 FROM MICROSOFT CORPORATION, MAXAR, CNES, DISTRIBUTION AIRBUS DS.

Summary of Groundwater Elevations  
Plant Wansley Landfill  
August 2022 Sampling Event

Monitoring Well ID	Total Depth (ft BTOC)	Top of Casing (ft NAVD88)	Depth to Water (ft BTOC)	Groundwater Elevation (ft NAVD88)
GWA-1	49.79	778.02	23.45	754.57
GWA-2	60.09	816.16	43.69	772.47

## Narrative

---

**Job Narrative  
180-134562-1**

### Receipt

The samples were received on 3/3/2022 9:30 AM, 3/5/2022 9:00 AM, 3/9/2022 10:30 AM and 3/11/2022 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 12 coolers at receipt time were 1.4°C, 1.5°C, 2.1°C, 2.7°C, 2.9°C, 2.9°C, 3.1°C, 3.7°C, 3.9°C, 4.2°C, 4.4°C and 4.4°C

### HPLC/IC

. Method 300\_ORGFM\_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 180-391482 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300\_ORGFM\_28D: The continuing calibration verification (CCV) associated with batch 180-392394 recovered above the upper control limit for <AffectedAnalytes>. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: EB-4 (180-135070-3), EB-3 (180-135070-11) and FB-4 (180-135070-13).

Method 300\_ORGFM\_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 180-394377 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

### Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

### General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

### Field Service / Mobile Lab

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 180-134562-1

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Accreditation/Certification Summary

# Client Sample Results

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 180-134562-1

**Client Sample ID: GWC-12**

**Lab Sample ID: 180-134886-2**

Date Collected: 03/07/22 15:25

Matrix: Water

Date Received: 03/09/22 10:30

**Method: EPA 300.0 R2.1 - Anions, Ion Chromatography**

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
Chloride	33		1.0	0.71	mg/L			03/14/22 20:07	1
Fluoride	0.18		0.10	0.026	mg/L			03/14/22 20:07	1
Sulfate	40		1.0	0.76	mg/L			03/14/22 20:07	1

**Method: EPA 6020B - Metals (ICP/MS) - Total Recoverable**

**Creator: Abernathy, Eric L**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Question	Answer	Comment
Radioactivity wasn't checked or is <math>\leq</math> background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

# Case Narrative

Client: Southern Company  
Project/Site: Wansley Landfill Surface Waters

Job ID: 180-134768-1

---

**Job ID: 180-134768-1**

---

**Laboratory: Eurofins Pittsburgh**

---

**Narrative**

**Job Narrative  
180-134768-1**

**Receipt**

The samples were received on 3/5/2022 9:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 2.1°C, 2.9°C, 2.9°C, 4.2°C, 4.4°C and 4.4°C

**HPLC/IC**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Metals**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**General Chemistry**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Field Service / Mobile Lab**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Wansley Landfill Surface Waters

Job ID: 180-134768-1

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Accreditation/Certification Summary

Client: Southern Company

# Login Sample Receipt Checklist

Client: Southern Company

Job Number: 180-134768-1

**Login Number: 134768**

**List Number: 1**

**Creator: Abernathy, Eric L**

**List Source: Eurofins Pittsburgh**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

*Laboratory Data Validations  
March 2022 Monitoring Event*

**LEVEL 2A LABORATORY DATA VALIDATIONS**

**Plant Wansley Landfill**

**Semiannual Event**

**March 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – March 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh for groundwater and surface water samples collected at Plant Wansley Landfill (LF) between February 28, 2022 and March 10, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. A laboratory data quality review and reanalysis of select metals analytes confirmed data reported on SDG 180-134562.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 Code of Federal Regulations (CFR), Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detection monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Determination of Inorganic Anions (USEPA Method 300.0), and Solids in Water (Standard Methods 2540C).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (field, equipment, and laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

**Laboratory Precision:** Laboratory goals for precision were met.

**Field Precision:** Field goals for precision were met, except for fluoride on GWC-15 (180-134886-4) and total dissolved solids (TDS), fluoride, and sulfate on GWC-17 (180-135070-5) as described in the qualifications section below.

**Accuracy:** Laboratory goals for accuracy were met except for chloride, fluoride, and sulfate from GWC-21 (180-134886-6) as described in the qualifications section below.

**Detection Limits:** Project goals for detection limits were met.

**Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.

**Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

**J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.

**ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. The applied qualifications may not have been required for all samples collected at the site. A summary of sample qualifications can be found in Table 2 of this Appendix.

- Samples GWC-15 (180-134886-4) and DUP-2 (180-134886-14) were qualified as estimated (J) for fluoride as the field relative percent difference (RPD) exceeded QC criteria (20.18% above limit of 20).

- Samples GWC-17 (180-135070-5) and DUP-3 (180-135070-12) were qualified as estimated (J) for TDS, fluoride, and sulfate as the field RPDs exceeded QC criteria (30.46%, 38.30%, and 26.09%, respectively, above limit of 20).
- Sample GWC-21 (180-134886-6) was qualified as estimated (J) for chloride, fluoride, and sulfate as the matrix spike (MS) recoveries were outside QC criteria (113%, 114%, and 114%, respectively, above the range of 90-110).
- Certain boron, zinc, and vanadium results were qualified as non-detect (ND) due to the analyte(s) being detected at a similar concentration in an associated blank sample. As shown in Table 2, when the original sample result was below the reporting limit (RL), the new method detection limit (MDL) was raised to the sample result as part of the qualification process; when the original sample result was above the RL, the new RL was raised to the sample result as part of the qualification process.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled between February 28, 2022 and March 10, 2022 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

**Narrative**

**Job Narrative  
180-137749-1**

**Receipt**

The samples were received on 5/6/2022 9:30 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.2°C

**Metals**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Field Service / Mobile Lab**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 180-137749-1

## Qualifiers

### Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Method Summary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 180-137749-1

Method	Method Description	Protocol	Laboratory
EPA 6020B	Metals (ICP/MS)	SW846	TAL PIT
EPA 7470A	Mercury (CVAA)	SW846	TAL PIT
Field Sampling	Field Sampling	EPA	TAL PIT
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	TAL PIT
7470A	Preparation, Mercury	SW846	TAL PIT

# Login Sample Receipt Checklist

Client: Southern Company

Job Number: 180-137749-1

**Login Number: 137749**

**List Source: Eurofins Pittsburgh**

**List Number: 1**

**Creator: Watson, Debbie**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

*Laboratory Data Validations  
May 2022 Verification Event*

**LEVEL 2A LABORATORY DATA VALIDATIONS**

**Plant Wansley Landfill**

**Verification Event**

**May 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – May 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh for groundwater samples collected at Plant Wansley Landfill (LF) between May 3, 2022 and May 4, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. SDG 180-137749 presents data from a verification event conducted to further assess previously-reported data for select metals analytes.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 Code of Federal Regulations (CFR), Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for specified detection monitoring constituents listed in 40 CFR, Part 257, Appendix III and specified assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV, as appropriate. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B) and Mercury in Liquid Wastes (USEPA Method 7470A).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, precision (matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

- Laboratory Precision:** Laboratory goals for precision were met.
- Field Precision:** Field goals for precision were met.
- Accuracy:** Laboratory goals for accuracy were met.
- Detection Limits:** Project goals for detection limits were met.
- Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.
- Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

- J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.
- ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled between May 3, 2022 and May 4, 2022 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

## Narrative

---

**Job Narrative  
180-139454-1**

**062722 Revised Report** to add field pH. This report replaces the report previously issued on 062422.

### Receipt

The sample was received on 6/9/2022 3:17 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.8°C and 4.4°C

### Metals

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Job ID: 180-139454-1

## Qualifiers

### Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Accreditation/Certification Summary

Client: Southern Company

Job Number: 180-139454-1

**Login Number: 139454**

**List Source: Eurofins Pittsburgh**

**List Number: 1**

**Creator: Abernathy, Eric L**

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

*Laboratory Data Validations  
June 2022 Evaluation Event*

**LEVEL 2A LABORATORY DATA VALIDATIONS**

**Plant Wansley Landfill**

**Evaluation Event**

**June 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – June 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh for a groundwater sample collected at Plant Wansley Landfill (LF) June 7, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. SDG 180-139454 presents data from a second evaluation event conducted to further assess previously-reported data for select metals analytes.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 Code of Federal Regulations (CFR), Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the sample was analyzed for specified detection monitoring constituents listed in 40 CFR, Part 257, Appendix III, as appropriate. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, accuracy (laboratory control sample), and blank contamination (laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

- Laboratory Precision:** Laboratory goals for precision were not applicable to this sampling event.
- Field Precision:** Field goals for precision were not applicable to this sampling event.
- Accuracy:** Laboratory goals for accuracy were met.
- Detection Limits:** Project goals for detection limits were met.
- Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.
- Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

- J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.
- ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical method and data validation guidelines.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled June 7, 2022 in accordance with the analytical method, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
^+	Continuing Calibration Verification (CCV) is outside acceptance limits, high biased.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

# Case Narrative

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-219538-1

**Job ID: 680-219538-1**

**Laboratory: Eurofins Savannah**

## Narrative

### Job Narrative 680-219538-1

#### Revision 1

The report being provided is a revision of the original report sent on 9/28/2022. The report (revision 1) is being in order to verify the results on two samples, GWC-15 (680-219890-7) and GWC-9 (680-219890-12), to remove an incorrect statement regarding the batch QC for 6020 metals batch 736267, and to include the CCV statement about this same 6020 batch. NOTE: GWC-9 (680-219890-12) was re-analyzed in Savannah for Cobalt with confirming results while this same sample was reanalyzed in Pittsburgh for Nickel & Zinc...also with confirming results. GWC-15 (680-219890-12) was reanalyzed and Boron results have been updated.

#### Receipt

The samples were received on 8/11/2022 7:30 AM, 8/13/2022 11:30 AM, 8/18/2022 1:30 PM and 8/20/2022 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 2.0°C, 2.1°C, 2.8°C, 3.2°C, 3.4°C and 4.1°C

#### HPLC/IC

Method 300\_ORGFM\_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-737096 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300\_ORGFM\_28D: Sample was reanalyzed to confirm EB detections for Chloride and Fluoride. EB-12 (680-219689-10)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

#### Metals

Method 6020B: The laboratory control sample (LCS) for preparation batch 680-735968 and analytical batch 680-736267 recovered outside control limits for the following analyte: Beryllium. The analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method 6020B: The continuing calibration verification (CCV) associated with batch 680-736267 recovered above the upper control limit for silver and beryllium. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

#### General Chemistry

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-735618 was outside control limits: (680-219516-C-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-736487 was outside control limits: (680-219689-A-4 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-736898 was outside control limits: (680-219890-A-13 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill - Surface Waters

Job ID: 680-219982-1

## Qualifiers

### HPLC/IC

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Case Narrative

Client: Southern Company  
Project/Site: Plant Wansley Landfill - Surface Waters

Job ID: 680-219982-1

---

**Job ID: 680-219982-1**

---

**Laboratory: Eurofins Savannah**

---

**Narrative**

---

**Job Narrative  
680-219982-1**

**Receipt**

The samples were received on 8/20/2022 8:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.7°C

**HPLC/IC**

Method 300\_ORGFM\_28D: The native sample, matrix spike, and matrix spike duplicate (MS/MSD) associated with analytical batch 680-737909 were performed at the same dilution. Due to the additional level of analyte present in the spiked samples, the concentration of Sulfate in the MS/MSD was above the instrument calibration range. The data have been reported and qualified.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**Metals**

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

**General Chemistry**

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-737144 was outside control limits: (680-219938-A-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

# Client Sample Results

Client: Southern Company  
Project/Site: Plant Wansley Landfill - Surface Waters

Job ID: 680-219982-1

**Client Sample ID: SWA-1**

**Lab Sample ID: 680-219982-1**

## Login Sample Receipt Checklist

Client: Southern Company

Job Number: 680-219982-1

**Login Number: 219982**

**List Number: 1**

**Creator: Sims, Robert D**

**List Source: Eurofins Savannah**

Question	Answer	Comment
Radioactivity wasn't checked or is <=/ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

**Annual Event**

**August 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – August 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh and Savannah for groundwater and surface water samples collected at Plant Wansley Landfill (LF) between August 9, 2022 and August 18, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1 of this Appendix. Work order 680-219538-1 was revised for the lab to correct errant narratives on metals batch data and an errant sample result discovered by reanalysis.

In accordance with groundwater monitoring and corrective action procedures discussed in the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4.-14 and Title 40 Code of Federal Regulations (CFR), Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detection monitoring constituents listed in 40 CFR, Part 257, Appendix III, assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV, and permit-required metals listed in 40 CFR, Part 258, Appendix I. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Determination of Inorganic Anions (USEPA Method 300.0), and Solids in Water (Standard Methods 2540C).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, precision (laboratory duplicate recoveries and matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control samples and matrix spike samples), and blank contamination (field, equipment, and laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

- Laboratory Precision:** Laboratory goals for precision were met, except for total dissolved solids (TDS) on GWC-8 (680-219689-4) and GWC-10 (680-219890-13) as described in the qualifications section below.
- Field Precision:** Field goals for precision were met, except for cobalt on GWA-4 (680-219538-4), zinc on GWC-5 (680-219689-1) and GWC-20 (680-219890-11), and chromium on GWC-11 (180-135070-5) as described in the qualifications section below.
- Accuracy:** Laboratory goals for accuracy were met, except for beryllium and silver on GWA-3 due to high continuing calibration verification (CCV) results on the sample, the associated method blank (MB), and/or the associated laboratory control sample (LCS). However, as the beryllium and silver results in the sample were non-detect, qualification was not necessary.
- Detection Limits:** Project goals for detection limits were met.
- Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.
- Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

- J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.
- ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. The applied qualifications may not have been required for all samples collected at the site. A summary of sample qualifications can be found in Table 2 of this Appendix.

- Samples GWC-8 (680-219689-4) and GWC-10 (680-219890-13) were qualified as estimated (J) for TDS as the laboratory relative percent differences (RPDs) exceeded QC criteria (10% and 14%, respectively, above limit of 5).
- Samples GWA-4 (680-219538-4) and FD-04 (680-219538-7) were qualified as estimated (J) for cobalt as the field RPD exceeded QC criteria (26.6% above limit of 20).
- Samples GWC-5 (680-219689-1), FD-05 (680-219689-8), GWC-20 (680-219890-11), and FD-07 (680-219890-15) were qualified as estimated (J) for zinc as the field RPDs exceeded QC criteria (90.2% and 60.9%, respectively, above limit of 20).
- Samples GWC-11 (680-219890-3) and FD-06 (680-219890-5) were qualified as estimated (J) for chromium as the field RPD exceeded QC criteria (25.6% above limit of 20).
- Certain antimony and zinc results were qualified as non-detect (ND) due to the analyte(s) being detected at a similar concentration in an associated blank sample. As shown in Table 2, when the original sample result was below the reporting limit (RL), the new method detection limit (MDL) was raised to the sample result as part of the qualification process; when the original sample result was above the RL, the new RL was raised to the sample result as part of the qualification process.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled between August 9, 2022 and August 18, 2022 in accordance with the analytical methods, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

## APPENDIX A

---

*Well Inspection Forms  
August 2022 Monitoring Event*

**Plant Wansley Landfill  
August 2022 Well Inspection Form**

Permit No.: 074-005D(LI)

1 - Location/Identification		GWA-1	GWA-2	GWA-3	GWA-4	GWC-5	GWC-6	GWC-7	GWC-8	GWC-9	GWC-10	GWC-11	GWC-12
a	Is the well visible and accessible?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
b	Is the well properly identified with the correct well ID?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
c	Does the well require protection from traffic?	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO
d	Is the drainage around the well acceptable? (No standing water, nor is well located in obvious drainage flow path)	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES

2 - Protective Outer Casing		GWA-1	GWA-2	GWA-3	GWA-4	GWC-5	GWC-6	GWC-7	GWC-8	GWC-9	GWC-10	GWC-11	GWC-12
a	Is the protective casing free from apparent damage?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
b	Is the casing free of degradation or deterioration?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
c	Does the casing have a functioning weep hole?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
d	Is the annular space between casings filled with pea gravel or sand?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
e	Is the well locked, and is the lock in good working condition?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES

NOTE: Form Derived from "Georgia EPD's Groundwater Monitoring Well Integrity Form".

**Plant Wansley Landfill  
August 2022 Well Inspection Form**

Permit No.: 074-005D(LI)

3 - Surface Pad		GWA-1	GWA-2	GWA-3	GWA-4	GWC-5	GWC-6	GWC-7	GWC-8	GWC-9	GWC-10	GWC-11	GWC-12
a	Is the well pad in good condition? (Not cracked or broken)	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
b	Does the well pad provide adequate surface seal and stability to the well?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
c	Is the well pad in complete contact with the protective casing?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
d	Is the well pad in complete contact with the ground surface? (Not undermined by erosion, animal burrows, and does not move when stepped on)	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
e	Is the pad surface clean? (Not covered by soil or debris)	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES

NOTE: Form Derived from "Georgia EPD's Groundwater Monitoring Well Integrity Form".

**Plant Wansley Landfill  
August 2022 Well Inspection Form**

Permit No.: 074-005D(LI)

**4 - Internal Well Casing**

		<b>GWA-1</b>	<b>GWA-2</b>	<b>GWA-3</b>	<b>GWA-4</b>	<b>GWC-5</b>	<b>GWC-6</b>	<b>GWC-7</b>	<b>GWC-8</b>	<b>GWC-9</b>	<b>GWC-10</b>	<b>GWC-11</b>	<b>GWC-12</b>
a	Does the well cap prevent entry of foreign material into the well?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
b	Is the casing free of kinks or bends, or any obstruction from foreign objects (such as bailers) ?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
c	Does the well have a venting hole near the top of casing?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
d	Is the survey point clearly marked on the inner casing?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
e	Is the depth of the well consistent with the original well log?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
f	Does the PVC casing move easily when touched or can it be taken apart by hand due to lack of grout or use of slip couplings in construction?	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO

**5 - Sampling (Groundwater Monitoring Wells Only):**

		<b>GWA-1</b>	<b>GWA-2</b>	<b>GWA-3</b>	<b>GWA-4</b>	<b>GWC-5</b>	<b>GWC-6</b>	<b>GWC-7</b>	<b>GWC-8</b>	<b>GWC-9</b>	<b>GWC-10</b>	<b>GWC-11</b>	<b>GWC-12</b>
a	Does the well recharge adequately when purged?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES
b	If dedicated sampling equipment is installed, is it in good condition?	N/A	YES	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
c	Does the well require redevelopment due to slow recharge or turbidity > 10 NTUs?	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO	NO

NOTE: N/A - Not Applicable; Form Derived from "Georgia EPD's Groundwater Monitoring Well Integrity Form".

**Plant Wansley Landfill  
August 2022 Well Inspection Form**

Permit No.: 074-005D(LI)

6 - Based on your professional judgment, is the well construction / location appropriate to:

	<b>GWA-1</b>	<b>GWA-2</b>	<b>GWA-3</b>	<b>GWA-4</b>	<b>GWC-5</b>	<b>GWC-6</b>	<b>GWC-7</b>	<b>GWC-8</b>	<b>GWC-9</b>	<b>GWC-10</b>	<b>GWC-11</b>	<b>GWC-12</b>
1) achieve the objectives of the facility Groundwater Monitoring Program, and 2) comply with the applicable regulatory requirements?	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES	YES

7 - Corrective actions completed and date(s):

Staff: H. Auld  
Date: 8/8/2022

NOTE: Form Derived from "Georgia EPD's Groundwater Monitoring Well Integrity Form".

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-223299-1

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Question	Answer	Comment
Radioactivity wasn't checked or is <math>\leq</math> background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <math><6\text{mm}</math> (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

*Laboratory Data Validations  
October 2022 Verification Event*

**LEVEL 2A LABORATORY DATA VALIDATIONS**

**Plant Wansley Landfill**

**Verification Event**

**October 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – October 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh and Savannah for a groundwater sample collected at Plant Wansley Landfill (LF) October 12, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample location, analytical parameters, QC samples, sampling date, and laboratory sample delivery group (SDG) designation is summarized in Table 1 of this Appendix. SDG 680-223299 presents data from a second evaluation event conducted to further assess previously-reported data for a select metals analyte.

In accordance with groundwater monitoring and corrective action procedures discussed in the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4.-14, the sample was analyzed for the specified monitoring constituent listed in Title 40 Code of Federal Regulations (CFR), Part 258, Appendix I. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, precision (matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control sample), and blank contamination (laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

- Laboratory Precision:** Laboratory goals for precision were met.
- Field Precision:** Field goals for precision were not applicable to this sampling event.
- Accuracy:** Laboratory goals for accuracy were met.
- Detection Limits:** Project goals for detection limits were met.
- Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.
- Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

- J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.
- ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical method and data validation guidelines.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled October 12, 2022 in accordance with the analytical method, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

## JOB DESCRIPTION

Plant Wansley Landfill

## JOB NUMBER

680-226409-1

# Eurofins Savannah

## Job Notes

The test results in this report meet NELAP requirements for parameters for which accreditation is required or available. Any exceptions to the NELAP requirements are noted. Results pertain only to samples listed in this report. This report may not be reproduced, except in full, without the written approval of the laboratory. Questions should be directed to the person who signed this report.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

# Definitions/Glossary

Client: Southern Company  
Project/Site: Plant Wansley Landfill

Job ID: 680-226409-1

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

November 2022 Verification Event*

**LEVEL 2A LABORATORY DATA VALIDATIONS**

**Plant Wansley Landfill**

**Verification Event**

**November 2022**

## **Georgia Power Company – Plant Wansley Landfill**

### **Quality Control Review of Analytical Data – November 2022**

This narrative presents results of the Quality Control (QC) data review performed on analytical data submitted by Eurofins Environment Testing America, Pittsburgh and Savannah for a groundwater sample collected at Plant Wansley Landfill (LF) November 29, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision-making purposes.

Information regarding the primary sample location, analytical parameters, QC samples, sampling date, and laboratory sample delivery group (SDG) designation is summarized in Table 1 of this Appendix. SDG 680-226409 presents data from a verification event conducted to further assess previously-reported data for a select metals analyte.

In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 Code of Federal Regulations (CFR), Subpart D – Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the sample was analyzed for specified detection monitoring constituents listed in 40 CFR, Part 257, Appendix III, as appropriate. Test methods included Inductively Coupled Plasma – Mass Spectrometry (USEPA Method 6020B).

Data were reviewed in accordance with the USEPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0)<sup>1</sup> and the National Functional Guidelines for Inorganic Superfund Methods Data Review (January 2017)<sup>2</sup>. The review included an assessment of the results for completeness, precision (matrix spike/matrix spike duplicate recoveries), accuracy (laboratory control sample), and blank contamination (laboratory blanks). Sample receipt conditions, holding times, and chains of custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytical methodology, method-specific criteria or professional judgment were used.

## DATA QUALITY OBJECTIVES

- Laboratory Precision:** Laboratory goals for precision were met.
- Field Precision:** Field goals for precision were not applicable to this sampling event.
- Accuracy:** Laboratory goals for accuracy were met.
- Detection Limits:** Project goals for detection limits were met.
- Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.
- Holding Times:** Holding time requirements were met.

## QUALIFICATIONS

In general, chemical results for the samples collected at the site were qualified on the basis of low precision or low accuracy or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the validation process:

- J:** The analyte was positively identified above the method detection limit; however, the associated numerical value is the approximate concentration of the analyte in the sample.
- ND:** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical method and data validation guidelines.

Atlantic Coast Consulting, Inc. reviewed the laboratory data from the Plant Wansley LF sampled November 29, 2022 in accordance with the analytical method, the laboratory-specified QC criteria, and the guidelines. As described above, the results were acceptable for project use.

*Statistical Analysis Report  
March 2022 Monitoring Event*

# GROUNDWATER STATS CONSULTING

August 31, 2022

Southern Company Services  
Attn: Ms. Kristen Jurinko  
241 Ralph McGill Blvd NE, Bin 10160  
Atlanta, Georgia 30308

Re: Plant Wansley Landfill – Background Update and February/March 2022  
Statistical Analysis

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and February/March 2022 Semi-Annual Groundwater Monitoring Statistical summary of the analysis of groundwater data for Georgia Power Company's Plant Wansley Landfill. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the CCR program in 2016, and for the State program in 2011 in accordance with the Georgia EPD's Solid Waste Permit. At least 8 background samples have been collected at each of the groundwater monitoring wells. Semi-annual sampling is performed in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations; and the August 2021 samples are evaluated in this report.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-3, GWA-4, GWA-28, and GWA-29
- **Downgradient wells:** GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-18, GWC-19, GWC-20, GWC-21, GWC-22, GWC-23, GWC-24, GWC-25, GWC-26, GWC-27, GWC-30, GWC-31, GWC-32, GWC-33, GWC-34, and GWC-35

While upgradient well GWA-3 and downgradient well GWC-24 have had periods of being historically dry, these wells have been consistently sampled over the past few years. Additionally, sampling began at downgradient well GWC-10 in 2016. These well/constituent pairs are discussed below.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Dr. Jim Loftis, Civil and Environmental professor emeritus at Colorado State University and Senior Advisor to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III** - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I** - antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix I well/constituent pairs with 100% non-detects follows this letter.

Time series plots for Appendix I and III parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Due to varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects.

Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well and may result in slight changes in statistical limits between sample events. Substitution of the most recent reporting limit generally gives the most conservative limit in each case. However, in the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves were provided previously, based on a 1-of-3 resample plan for Appendix I constituents and a 1-of-2 resample plan for Appendix III constituents, to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. During this background update, sufficient samples are available for Appendix I constituents to provide sufficient power using a 1-of-2 resample plan. A power curve is provided following this letter. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

**Georgia EPD Appendix I Constituents:**

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all parameters)
- # Constituents: 16
- # Downgradient wells: 29

**CCR Appendix III Constituents:**

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (pH, sulfate, and TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, and fluoride)
- # Constituents: 7
- # Downgradient wells: 29

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

### Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell

methods use background data for individual wells and may be overly sensitive to natural variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of natural variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from natural variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless all resamples also exceed the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of natural variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of natural

variation rather than a result of impact to groundwater quality downgradient of the facility.

## **Background Screening Summary – Georgia EPD Appendix I – Conducted in August 2019**

### Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. When the most recent values were identified as outliers, values were not flagged in the database at this time (except in cases where they would cause background limits to be elevated) as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values were observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers. Due to changing reporting limits for many constituents, when the non-detects were replaced with the most recent reporting limit, previously flagged "J" values (or estimated values) required flagging as outliers because they were much higher than current reporting limits.

Of the outliers identified by Tukey's method, several values were flagged in the database, and the remaining values were similar to other measurements within a given well or neighboring wells or were reported non-detects. Several other values were flagged in addition to those identified by Tukey's because the values were higher than all remaining concentrations and would cause the statistical limits to be elevated. A summary of all flagged values is included in Figure C.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well.

## Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

## Trend Test Analysis

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. The required adjustments to the background data are performed by truncating data at the beginning of the record and the truncated data may be seen in a lighter font on the prediction limit data pages.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations; therefore, most records required no adjustments at that time.

Exceptions included cobalt and nickel in downgradient well GWC-14 for which current measurements were higher than those reported historically for this well as well as higher than those observed upgradient of the facility. Therefore, trend tests were recommended in lieu of prediction limits and data prior to August 2017 were truncated for cobalt and nickel. An alternate source demonstration was, reportedly, prepared for cobalt and nickel and demonstrated that the concentration levels of these constituents are not a result of practices of the facility. During the current background update, these records were updated to use current data for construction of prediction limits and are included in the analysis.

## Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified statistical differences among the means or medians of the upgradient well data for the following constituents: barium, beryllium, cadmium, cobalt, copper, nickel, silver, and zinc. No differences were noted for antimony, arsenic, chromium, mercury, selenium, thallium, and vanadium. The ANOVA could not test lead as the upgradient well data had no variation.

Because this is a lined landfill with pre-waste data that show metals were present naturally in low level detections during the collection of background data, intrawell prediction limits were recommended as the most appropriate statistical analysis at this landfill. It was also noted that for some constituents the reported concentrations were higher in upgradient wells which would result in limits that would not readily detect subtle changes in concentrations in downgradient wells.

## **Background Update Summaries**

### **CCR Appendix III – Conducted in March 2020**

#### Outlier Analysis

Prior to updating background data for Appendix III constituents, Tukey's outlier test and visual screening were used to evaluate data through September 2019. Tukey's test was used on all wells for constituents evaluated using intrawell methods and for only upgradient wells for constituents evaluated using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged as such in the database because a number of the values appeared to be representative of natural variation in both upgradient and downgradient wells. Other values, not identified by

Tukey's test, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter.

### Mann-Whitney Evaluation

For constituents requiring intrawell prediction limits (pH, sulfate, and TDS), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2017 to the new compliance samples at each well through September 2019. If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. Note that the record for sulfate at GWC-5 was adjusted to use the most recent 8 samples through September 2019 to construct the intrawell prediction limit at this well. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier. The results and a summary of the background update were submitted with the report.

### **Background Update (GWA-3, GWC-10, GWC-24) – August 2021**

#### Outlier Analysis

During the August 2021 analysis, the records for copper, nickel, silver, vanadium, and zinc in downgradient wells GWC-10 and GWC-24 and upgradient well GWA-3 were re-evaluated for outliers and trends through December 2020 in order to construct statistical limits with at least 8 values in background.

Tukey's outlier test and visual screening were used to evaluate data at these wells through December 2020. Note that for some well/constituent pairs, Tukey's test results were invalidated because the upper and lower quartiles were equal. While Tukey's test did not identify any outliers, the highest values for copper, silver, and zinc in well GWC-10 were identified visually through time series graphs and flagged as outliers since they did not appear to represent the population for these constituents at this well. This step reduces variation and results in statistical limits that are conservative (i.e., lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. A summary of all flagged outliers follows this letter.

### Trend Test Evaluation

As mentioned above, while trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at wells GWA-3, GWC-10, and GWC-24 for copper, nickel, silver, vanadium, and zinc. No significant trends were identified among data through December 2020 for any of the aforementioned well/constituent pairs; therefore, no adjustments were required. The trend test results were included with the August 2021 report.

## **Background Update Summary – Appendix I and III Constituents – March 2022**

### Outlier Analysis

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data through August 2021 (Figure C). Tukey's test was used on all wells for Appendix I and III constituents evaluated using intrawell methods and for upgradient wells (pooled data) for Appendix III constituents evaluated using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged as such in the database because a number of the values appeared to be representative of natural variation in both upgradient and downgradient wells or resulted from reported trace values compared to nondetect measurements within a record. Other values, not identified by Tukey's test, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter.

### Mann-Whitney Evaluation

For constituents requiring intrawell prediction limits (all Appendix I constituents and pH, sulfate and TDS for the Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through June 2018 and September 2019, respectively, to new compliance samples at each well through August 2021 (Figures D and E). Background data sets for upgradient well GWA-3 and

downgradient wells GWC-10 and GWC-24 for copper, nickel, silver, vanadium, and zinc were last updated during August 2021. The Mann-Whitney test requires a minimum of four compliance measurements. Therefore, these records currently have insufficient samples to test for updating and will be evaluated for updating during the 2024 background update along with all other records.

If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The Mann-Whitney test identified several statistically significant results. However, many of the differences resulted from reported trace values compared to nondetect results within a given record. In some cases, while the median of the compliance data was identified as significantly different from the historical median, the reported concentrations in more recent data were similar to those reported historically. In other cases, such as barium in wells GWC-12, GWC-16, GWC-18, GWC-21, GWC-26, and GWC-34 and zinc in well GWC-14, which had statistically significant increasing medians, the reported measurements at these wells are significantly lower than those reported in one or more upgradient wells indicating natural variation in groundwater quality.

Therefore, all records were updated through August 2021 except for barium in well GWC-14 where compliance concentrations are higher than historical concentrations within this well, and higher than concentrations reported in upgradient wells. Further research beyond the scope of this analysis would be required to understand the cause of the increased concentrations. A trend test is recommended in lieu of an intrawell prediction limit for this well/constituent pair. If further research confirms the more recent measurements are a result of naturally changing groundwater quality, a prediction limit will be constructed using data that represents present-day groundwater quality conditions.

Additionally, the records for cobalt in wells GWC-5 and GWC-7 were truncated to use the more recent portion of the records with lower reported concentrations than those reported historically within each record. This step serves to provide prediction limits that are conservative (i.e., lower) from a regulatory perspective.

A summary of background data ranges for these well/constituent pairs, along with other well/constituent pairs with truncated records, follows this letter. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier.

## Upgradient Well Trend Tests – Interwell Testing

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the Appendix III constituents requiring interwell prediction limits (boron, calcium, chloride, and fluoride) to identify statistically significant increasing or decreasing trends in background (Figure F). The results of the trend analyses showed no statistically significant increasing or decreasing trends except for a statistically significantly decreasing trend in upgradient well GWA-29 for fluoride. Reported measurements in this well were similar to those in neighboring upgradient wells. Therefore, no adjustments were required.

## **Statistical Analysis of Georgia EPD Appendix I Constituents – February/March 2022**

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking natural spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to natural spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of natural variation rather than impacts of the landfill.

## Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August 2021, except for the cases mentioned above, for each well with detections (Figure G). The February/March 2022 compliance data are compared to these intrawell background limits. As previously discussed, a trend test was used in lieu of a prediction limit for barium in downgradient well GWC-14 and is included with the trend tests for prediction limit exceedances (Figure L). No statistical analyses were required for well/constituent pairs with 100% non-detects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance

is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of the Georgia EPD prediction limits follows this report. Statistical exceedances were noted for the following well/constituent pairs:

- Copper: GWC-22
- Mercury: GWC-14
- Zinc: GWC-33

Note that the exceedances for copper and mercury result from having more significant digits in the reported observations than in the limit.

### Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure H). The following exceedances were noted:

- Mercury: GWC-14
- Zinc: GWC-33

### Trend Test Analysis

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure L). Additionally, barium at well GWC-14 was evaluated using a trend test in lieu of an intrawell prediction limit. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site which is an indication of natural variability in groundwater unrelated to practices at the site. The following statistically significant trends were identified:

Increasing:

- Barium: GWA-4 (upgradient) and GWC-14

Decreasing

- Copper: GWA-29 (upgradient)

When similar trends are identified for constituents upgradient of the facility, it is an indication of naturally changing groundwater quality. Further research would be needed to determine if the change in concentrations for barium in downgradient well GWC-14 is also a result of naturally changing groundwater quality.

### **Statistical Analysis of CCR Appendix III Parameters – August 2021**

As mentioned above, intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether there are statistically significant increases (SSIs).

#### Intrawell Prediction Limits

For sulfate, pH, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2021, except for the case of sulfate in well GWC-5 which uses historical data from 8/31/2011 through 8/19/2021 (Figure I). The February/March 2022 samples were compared to established statistical limits. Exceedances were noted for the following well/constituent pairs:

- Sulfate: GWC-12, GWC-15, GWC-16, GWC-18, and GWC-21

#### Two-Step Approach

Following the two-step analysis procedure as mentioned above, interwell prediction limits were also constructed using pooled upgradient well data to evaluate the initial intrawell prediction limit exceedances (Figure J). No interwell prediction limit exceedances were noted; therefore, no statistically significant increase (SSI) is identified, and no further action is necessary.

## Interwell Prediction Limits

For boron, calcium, chloride, and fluoride which are evaluated using all historical upgradient well data through February/March 2022 to construct interwell prediction limits combined with a 1-of-2 resample plan (Figure K). Exceedances were noted for boron at wells GWC-12, GWC-14, and GWC-15 and for chloride at GWC-14.

## Trend Test Analysis

Data from downgradient well/constituent pairs for Appendix III constituents found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test along with upgradient wells for the same constituents (Figure L). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of natural variability in groundwater unrelated to practices at the site. The following statistically significant increasing trend was identified:

- Sulfate: GWC-12

No other statistically significant trends were identified for the Appendix III constituents. A summary of the trend test results follows this letter.

## **Summary**

Based on the results of the Appendix I and III constituents requiring intrawell prediction limits combined with interwell prediction limits to evaluate apparent exceedances according to the Two-Step Approach, as well as the Appendix III constituents evaluated using interwell prediction limits, the following downgradient prediction limit exceedances were identified:

### Appendix I

- Mercury: GWC-14
- Zinc: GWC-33

### Appendix III

- Boron: GWC-12, GWC-14, and GWC-15
- Chloride: GWC-14

As discussed earlier, a trend test was used to evaluate barium concentrations at well GWC-14 due to higher concentrations in more recent data compared to those reported historically as well as concentrations reported in upgradient wells. Statistically significant increasing trends were identified in upgradient well GWA-4 and downgradient well GWC-14. Further research would be required to determine if the increasing trend in well GWC-14 reflects natural variation in groundwater quality similar to the changing concentrations upgradient of the facility.

## **Resample Reports – May 2022**

### Appendix I Constituents

Resamples were collected in May 2022 for the apparent intrawell prediction limit exceedances identified for mercury in downgradient well GWC-14 and zinc in downgradient well GWC-33. Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed for mercury and zinc at these wells using all available data through August 2021 to evaluate the resamples (Figure M). The following exceedance was noted:

- Zinc: GWC-33

Following the Two-Step procedure as mentioned above, interwell prediction limits were also constructed using pooled upgradient well data to evaluate the intrawell prediction limit exceedance of zinc at well GWC-33 (Figure N). No interwell prediction limit exceedance was noted; therefore, no statistically significant increases (SSIs) were identified for the Appendix I constituents, and no further action is necessary.

### Appendix III Constituents

Resamples were collected in May 2022 for the apparent interwell prediction limit exceedances identified for boron in wells GWC-12, GWC-14, and GWC-15. Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed for boron using pooled upgradient well data through March 2022 (Figure O). The following exceedances were noted:

- Boron: GWC-14 and GWC-15

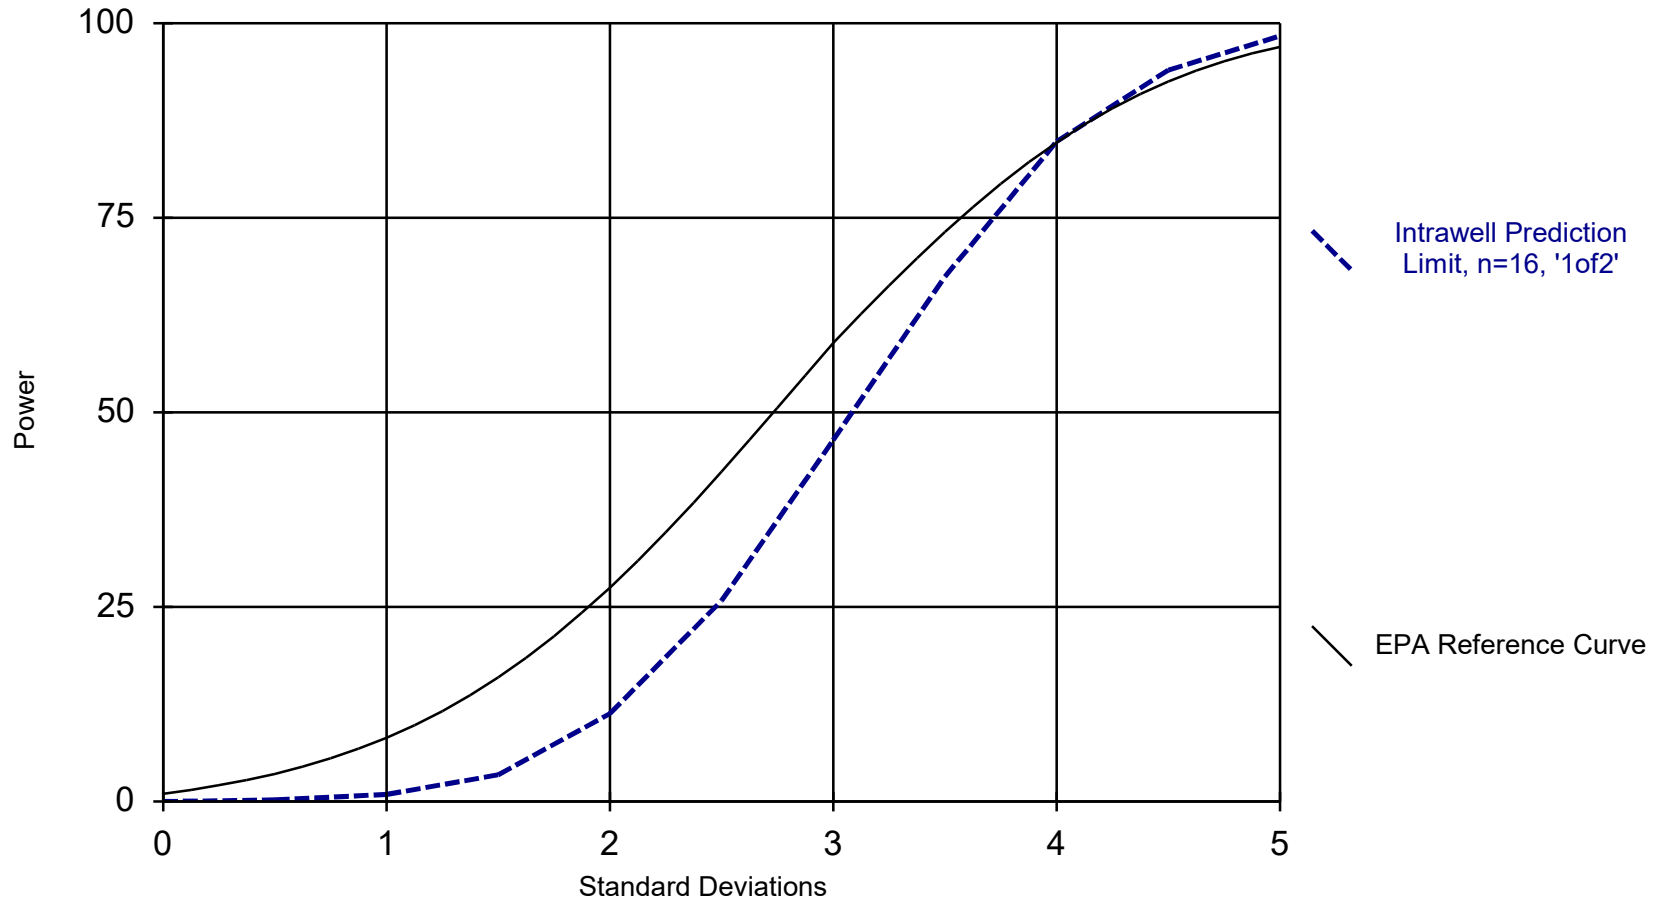

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Wansley Landfill. If you have any questions or comments, please feel free to contact us.

### Tukey's Outlier Screening GWA-2 (bg)

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>6</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWA-28 (bg)

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>6</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWA-29 (bg)

n = 28  
 No outliers found.  
 Tukey's method selected by user.  
 Data were square transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWA-3 (bg)

n = 16  
 No outliers found.  
 Tukey's method selected by user.  
 Data were natural log transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

Tukey's Outlier Screening  
GWC-10

n = 19  
No outliers found. Tukey's method selected by user.  
Data were natural log transformed to achieve best W statistic (graph shown in original units).  
The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Tukey's Outlier Screening  
GWC-11

n = 30  
No outliers found. Tukey's method selected by user.  
Data were cube root transformed to achieve best W statistic (graph shown in original units).  
The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Tukey's Outlier Screening  
GWC-13

n = 30  
No outliers found. Tukey's method selected by user.  
Data were natural log transformed to achieve best W statistic (graph shown in original units).  
The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
Plant Wansley Client: Southern Company Data: Wansley Landfill

Tukey's Outlier Screening  
GWC-18

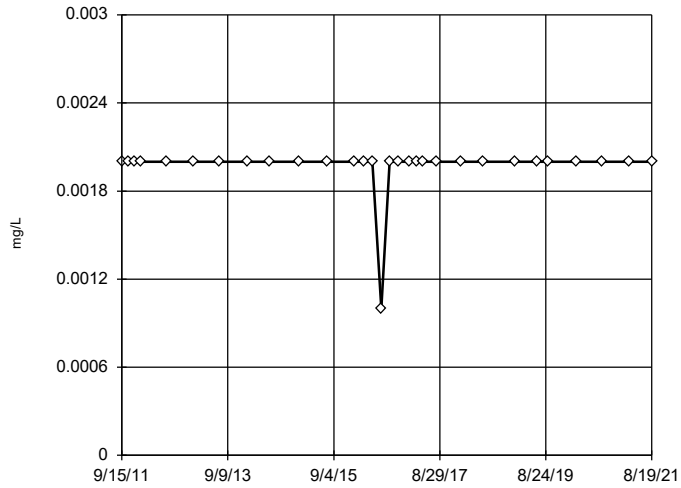

n = 30  
No outliers found. Tukey's method selected by user.  
Ladder of Powers transformations did not improve normality; analysis run on raw data.  
The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-22

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>6</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-23

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>6</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

### Tukey's Outlier Screening GWC-24

n = 21  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>6</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because both the lower and upper quartiles represent reporting limits.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-25

n = 29  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>4</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-26

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were cube root transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-27

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were natural log transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-30

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were cube transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-31

n = 25  
 No outliers found.  
 Tukey's method selected by user.  
 Data were square transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-32

n = 30  
 No outliers found.  
 Tukey's method selected by user.  
 Data were x<sup>5</sup> transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells  
 Plant Wansley Client: Southern Company Data: Wansley Landfill

### Tukey's Outlier Screening GWC-33

n = 29  
 No outliers found.  
 Tukey's method selected by user.  
 Data were square transformed to achieve best W statistic (graph shown in original units).  
 The results were invalidated, because the lower and upper quartiles are equal.

Constituent: Antimony Analysis Run 5/11/2022 10:20 AM View: Outlier Testing - All Wells
