QUALIFIERS

Project: Bowen AP-1 (CA)
Pace Project No.: 92767550

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

ANALYTE QUALIFIERS

B	Analyte was detected in the associated method blank.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

Subject:	**Stage 2A Data Validation - Level II Data Deliverables – Pace Analytical Services, LLC Project Numbers 92711015, 92711021 Revision 1, 92723474, 92723469 and 92732634**

SITE: Plant Bowen Ash Pond

INTRODUCTION

This report summarizes the findings of the Stage 2A data validation of forty-seven aqueous samples, seven field duplicates, five equipment blanks, and seven field blanks collected 30-31 January, 1-2 and 5-8 February, 3 April and 22 May 2024 as part of the Plant Bowen Ash Pond on-site sampling event.

The samples were analyzed at Pace Analytical Services, LLC, Peachtree Corners, Georgia, for the following analytical tests:

- Metals by United States (US) Environmental Protection Agency (EPA) Methods 3010A/6010D
- Metals by US EPA Methods 3005A/6020B
- Mercury by US EPA Method 7470A

The samples were analyzed at Pace Analytical Services, LLC, Asheville, North Carolina, for the following analytical tests:

- Anions (Chloride, Fluoride and Sulfate) by US EPA Method 300.0
- Alkalinity by Standard Method 2320B
- Total Dissolved Solids (TDS) by Standard Method 2540C
- Sulfide by Standard Method 4500-S2D

The samples were analyzed at Pace Analytical Services, LLC, Greensburg, Pennsylvania, for the following analytical tests:

- Radium-226 by US EPA Method 9315
- Radium-228 by US EPA Method 9320
- Total Radium by Calculation

EXECUTIVE SUMMARY

Overall, based on this Stage 2A data validation covering the quality control (QC) parameters listed below and based on the information provided, the data as qualified are usable for supporting project objectives. The qualified data should be used within the limitations of the qualifications.

The data were reviewed based on the pertinent methods referenced in the laboratory report, professional and technical judgment, and the following documents:

- United States (US) EPA Region IV Data Validation Standard Operating Procedures (US EPA Region IV, September 2011);
- USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review, January 2017 (EPA 540-R-2017-001); and
- American National Standard, Verification and Validation of Radiological Data for use in Waste Management and Environmental Remediation, February 15, 2012 (ANSI/ANS-41.5-2012).

The following samples were analyzed and reported in the laboratory reports:

The samples were received within 0-6 degrees Celsius (ºC). No sample preservation issues were noted by the laboratory.

Laboratory report 92711021 was revised on March 21, 2024, to update the sample date for sample BOW-BGWA-33. The revised report was identified as 92711021 Revision 1.

1.0 METALS

The samples were analyzed for metals by US EPA methods 3010A/6010D and 3005A/6020B. (Mercury was evaluated separately in Section 2.0, below).

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

1.1 Overall Assessment

The metals data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

1.2 Holding Time

The holding time for the metals analysis of a preserved water sample is 180 days from sample collection to analysis. The holding times were met for the sample analyses.

1.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The metals were not detected in the method blanks at or above the method detection limits (MDLs), with the following exception.

Antimony (0.00084 mg/L) was detected at an estimated concentration greater than the MDL and less than the reporting limit (RL) in the method blank in batch 830824. Therefore, the estimated antimony concentrations in samples BOW-BGWC-25 and BOW-BGWC-31 were U qualified as not detected at the RL. Since antimony was not detected in the remaining associated samples, no additional qualifications were applied to the data.

Sample ID	Analyte	Laboratory Result (mg/L)	Laboratory Flag	Validation Result (mg/L)	Validation Qualifier*	Reason Code**
BOW-BGWC-25	Antimony	0.00058	J B	0.0030	U	BL1
BOW-BGWC-31	Antimony	0.0023	J B	0.0030	U	BL1

B- Laboratory flag indicating the analyte was detected in the associated method blank
J - The result is less than the RL, but greater than or equal to the MDL, and the concentration is an approximate value
* Validation qualifiers are defined in Attachment 1 at the end of this report
**Reason codes are defined in Attachment 2 at the end of this report

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Sample set specific MS/MSD pairs were reported, using samples BOW-BGWA-47D, BOW-BGWC-21, BOW-BGWC-23, BOW-BGWC-24, BOW-BGWA-33, BOW-PT-03 (92723469) and BOW-PT-02 (92732634). The recovery and relative percent

difference (RPD) results were within the laboratory specified acceptance criteria, with the following exceptions.

One or both recoveries of calcium and magnesium in the MS/MSD pair using sample BOW-BGWA-47D were high or low and outside of the laboratory specified acceptance criteria. Since the calcium and magnesium concentrations in sample BOW-BGWA-47D were greater than four times the spike concentrations, no qualifications were applied to the data.

The recoveries of calcium in the MS/MSD pair using sample BOW-BGWC-21 were low and outside of the laboratory specified acceptance criteria. Since the calcium concentration in sample BOW-BGWC-21 was greater than four times the spike concentration, no qualifications were applied to the data.

One or both recoveries of calcium, magnesium, potassium and sodium in the MS/MSD pair using sample BOW-BGWC-23 were high or low and outside of the laboratory specified acceptance criteria. Since the calcium, magnesium, potassium and sodium concentrations in sample BOW-BGWC-23 were greater than four times the spike concentrations, no qualifications were applied to the data.

The MSD recovery of boron in the MS/MSD pair using sample BOW-BGWC-24 was low and outside of the laboratory specified acceptance criteria. Since the boron concentration in sample BOW-BGWC-24 was greater than four times the spike concentration, no qualifications were applied to the data.

The MSD recovery of boron in the MS/MSD pair using sample BOW-PT-03 was low and outside of the laboratory specified acceptance criteria. Since the boron concentration in sample BOW-PT-03 was greater than four times the spike concentration, no qualifications were applied to the data.

Batch MS/MSD pairs were also reported for metals by US EPA methods 6010D and 6020B. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

1.5 Laboratory Control Sample (LCS)

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported with each batch. The recovery results were within the laboratory specified acceptance criteria.

1.6 Field Blank

Seven field blanks BOW-AP1-FB-01 (92711015), BOW-AP1-FB-01 (92723474), BOW-AP1-FB-01 (92723469), BOW-AP1-FB-01 (92732634), BOW-AP1-FB-02, BOW-AP1-FB-03 and

BOW-AP1-FB-04 were collected with the sample set. Metals were not detected in the field blanks at or above the MDLs, with the following exception.

Magnesium was detected in field blank BOW-AP1-FB-04 at an estimated concentration greater than the MDL and less than the RL. Since magnesium was not detected or detected above the RLs in the remaining associated samples, no additional qualifications were applied to the data.

Boron was detected in field blank BOW-AP1-FB-01 (92732634) at an estimated concentration greater than the MDL and less than the RL. Since boron was not detected or detected above the RLs in the remaining associated samples, no additional qualifications were applied to the data.

1.7 Equipment Blank

Five equipment blanks BOW-AP1-EB-01 (92711015), BOW-AP1-EB-01 (92723474), BOW-AP1-EB-01 (92723469), BOW-AP1-EB-01 (92732634) and BOW-AP1-EB-02 were collected with the sample set. Metals were not detected in the equipment blanks at or above the MDLs, with the following exceptions.

Boron was detected in BOW-AP1-EB-01 (92711015) at an estimated concentration greater than the MDL and less than the RL. Therefore, the estimated concentrations of boron in associated samples BOW-BGWA-2, BOW-BGWA-33, BOW-BGWA-47D, BOW-BGWA-48D, BOW-BGWA-6, BOW-BGWC-21, BOW-BGWC-44D and BOW-BGWC-8 were U qualified as not detected above the RL and the concentrations of boron in associated samples BOW-AP1-FD-03, BOW-BGWC-25 and BOW-BGWC-50D were J+ qualified as estimated with high bias, based on professional and technical judgment.

Boron was detected in BOW-AP1-EB-01 (92723469) at an estimated concentration greater than the MDL and less than the RL. Since boron was detected above the RLs in the remaining associated samples, no additional qualifications were applied to the data.

1.8 Field Duplicate

Seven field duplicates BOW-AP1-FD-01 (92711015), BOW-AP1-FD-01 (92723474), BOW-AP1-FD-01 (92723469), BOW-AP1-FD-01 (92732634), BOW-AP1-FD-02, BOW-AP1-FD-03 and BOW-AP1-FD-04 were collected with the sample set. Acceptable precision (RPD $\leq$ 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-BGWC-36D, BOW-BGWC-43D, BOW-BGWC-22, BOW-PT-03, BOW-BGWC-18, BOW-BGWC-25 and BOW-BGWC-41D, respectively, with the following exceptions.

Antimony was detected at an estimated concentration greater than the MDL and less than the RL in sample BOW-BGWC-36D and not detected in field duplicate BOW-AP1-FD-01, resulting in a noncalculable RPD. Therefore, the estimated antimony concentration in sample BOW-BGWC-36D was J qualified as estimated and the nondetect antimony result in field duplicate BOW-AP1-FD-01 was UJ qualified as estimated less than the MDL.

Iron was detected at an estimated concentration greater than the MDL and less than the RL in field duplicate BOW-AP1-FD-02 and not detected in sample BOW-BGWC-18, resulting in a noncalculable RPD. Therefore, the estimated iron concentration in field duplicate BOW-AP1-FD-02 was J qualified as estimated and the nondetect iron result in sample BOW-BGWC-18 was UJ qualified as estimated less than the MDL.

Antimony was detected at an estimated concentration greater than the MDL and less than the RL in sample BOW-BGWC-25 and not detected in field duplicate BOW-AP1-FD-03, resulting in a noncalculable RPD. Since the antimony concentration in sample BOW-BGWC-25 was previously qualified due to method blank contamination, no additional qualifications were applied to the data based on technical and professional judgment.

Thallium was detected at an estimated concentration greater than the MDL and less than the RL in sample BOW-BGWC-43D and not detected in field duplicate BOW-AP1-FD-01 (92723474), resulting in a noncalculable RPD. Therefore, the estimated thallium concentration in sample BOW-BGWC-43D was J qualified as estimated and the nondetect antimony result in field duplicate BOW-AP1-FD-01 was UJ qualified as estimated less than the MDL.

1.9 Sensitivity

The samples were reported to the MDLs. Elevated non-detect results were not reported.

2.0 MERCURY

The samples were analyzed for mercury by US EPA method 7470A.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

2.1 Overall Assessment

The mercury data reported in this data set are considered usable for supporting project objectives. The analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

2.2 Holding Time

The holding time for the mercury analysis of a water sample is 28 days from sample collection to analysis. The holding times were met for the sample analyses.

2.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Mercury was not detected in the method blanks at or above the MDL.

2.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Sample set specific MS/MSD pairs were reported using samples BOW-BGWC-24, BOW-BGWA-29 and BOW-BGWC-38D. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exception.

The MSD recovery was low and the RPD was high, both outside the laboratory specified acceptance criteria for mercury in the MS/MSD pair using sample BOW-BGWC-24. Therefore, the concentration of mercury in sample BOW-BGWC-24 was J qualified as estimated.

Sample ID	Compound	Laboratory Result (mg/L)	Laboratory Flag	Validation Result (mg/L)	Validation Qualifier	Reason Code

2.5 Laboratory Control Sample

LCSs were analyzed at the frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported for each batch. The recovery results were within the laboratory specified acceptance criteria.

2.6 Field Blank

Four field blanks BOW-AP1-FB-01, BOW-AP1-FB-02, BOW-AP1-FB-03 and BOW-AP1-FB-04 were collected with the sample set. Mercury was not detected in the field blanks at or above the MDL.

2.7 Equipment Blank

Two equipment blanks BOW-AP1-EB-01 and BOW-AP1-EB-02 were collected with the sample set. Mercury was not detected in the equipment blanks at or above the MDL.

2.8 Field Duplicate

Four field duplicates BOW-AP1-FD-01, BOW-AP1-FD-02, BOW-AP1-FD-03 and BOW-AP1-FD-04 were collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-BGWC-36D, BOW-BGWC-18, BOW-BGWC-25 and BOW-BGWC-41D, respectively.

2.9 Sensitivity

The samples were reported to the MDL. Elevated non-detect results were not reported.

3.0 WET CHEMISTRY

The samples were analyzed for TDS by Standard Method 2540C, alkalinity by Standard Method 2320B, sulfide by Standard Method 4500-S2D and anions (chloride, fluoride, and sulfate) by US EPA method 300.0.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. 3.1 Overall Assessment

The wet chemistry data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to

the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

3.2 Holding Times

The holding time for the TDS analysis of a water sample is 7 days from sample collection to analysis. The holding time for the anions (chloride, fluoride, and sulfate) analysis of a water sample is 28 days from sample collection to analysis. The holding time for the alkalinity analysis of a water sample is 14 days from sample collection to analysis. The holding times were met for the sample analyses.

3.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The wet chemistry parameters were not detected in the method blanks at or above the MDLs.

3.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples).

Sample set specific MS/MSD pairs were reported for alkalinity using BOW-BGWC-17, BOW-AP1-FB-02, BOW-AP1-FB-03, BOW-AP1-FD-04 and BOW-AP1-FB-04. The recovery and RPD results were within the laboratory specified acceptance criteria.

Sample set specific MS/MSD pairs were reported for sulfide using BOW-AP1-FB-01, BOW-BGWA-47D, BOW-BGWC-8, BOW-AP1-FD-02, BOW-BGWC-25, BOW-BGWC-30 and BOW-AP1-FD-04. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exceptions.

The recoveries of sulfide in the MS/MSD pair using sample BOW-AP1-FD-04 were low and outside the laboratory specified acceptance criteria. Therefore, the nondetect result for sulfide in sample BOW-AP1-FD-04 was UJ qualified as estimated less than the RL.

Sample set specific MS/MSD pairs were reported for anions using samples BOW-BGWC-36D, BOW-BGWC-16, BOW-BGWC-38D and BOW-AP1-FB-04. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exceptions.

The recoveries of chloride in the MS/MSD pair using sample BOW-BGWC-36D were low and outside the laboratory specified acceptance criteria. Since the concentration of chloride in sample

BOW-BGWC-36D was greater than four times the spike concentration, no qualifications were applied to the data.

The MSD recovery of fluoride in the MS/MSD pair using sample BOW-BGWC-36D was high and outside the laboratory specified acceptance criteria. Therefore, the estimated fluoride concentration in sample BOW-BGWC-36D was J qualified as estimated.

The recoveries of sulfate in the MS/MSD pair using sample BOW-BGWC-16 were low and outside the laboratory specified acceptance criteria. Since the concentration of sulfate in sample BOW-BGWC-16 was greater than four times the spike concentration, no qualifications were applied to the data.

The recoveries of chloride in the MS/MSD pair using sample BOW-BGWC-38D were low and outside the laboratory specified acceptance criteria. Since the concentration of chloride in sample BOW-BGWC-38D was greater than four times the spike concentration, no qualifications were applied to the data.

Batch MS/MSD pairs were also reported for alkalinity and the anions. Since these were batch QC there was no impact on the data and qualifications were not applied.

3.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The recovery results were within the laboratory specified acceptance criteria.

3.6 Laboratory Duplicate

Sample set specific laboratory duplicates were reported using samples BOW-BGWC-17, BOW-BGWC-20, BOW-BGWC-30, BOW-BGWC-40 and BOW-BGWC-23. The RPD results were within the laboratory specified acceptance criteria.

3.7 Field Blank

Four field blanks BOW-AP1-FB-01, BOW-AP1-FB-02, BOW-AP1-FB-03 and BOW-AP1-FB-04 were collected with the sample set. The wet chemistry parameters were not detected in the field blanks at or above the MDLs.

3.8 Equipment Blank

Two equipment blanks BOW-AP1-EB-01 and BOW-AP1-EB-02 were collected with the sample set. The wet chemistry parameters were not detected in the equipment blanks at or above the MDLs.

3.9 Field Duplicate

Four field duplicates BOW-AP1-FD-01, BOW-AP1-FD-02, BOW-AP1-FD-03 and BOW-AP1-FD-04 were collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-BGWC-36D, BOW-BGWC-18, BOW-BGWC-25 and BOW-BGWC-41D, respectively.

3.10 Sensitivity

The samples were reported to the MDLs for anions and to the RLs for alkalinity and TDS. Elevated non-detect results were not reported.

4.0 RADIOCHEMISTRY

The samples were analyzed for radium-226 by US EPA method 9315, radium-228 by US EPA method 9320 and total radium by calculation.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. 4.1 Overall Assessment

The radium-226 and radium-228 data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

4.1.1 Analysis Anomaly

Total radium was reported at the minimum detectable concentration (MDC) for radium-226 and radium-228. Radium-228 was detected greater than the MDC in samples BOW-AP1-FB-02 and BOW-BGWC-23. Since total radium is calculated from radium-226 and radium-228, and radium-228 was greater than the MDC, and based on professional and technical judgment, the total radium concentrations for this sample was reported with no qualifications.

Total radium was reported at the MDC for radium-226 and radium-228. Radium-226 was detected greater than the MDC in samples BOW-AP1-FB-02, BOW-BGWC-10, BOW-BGWC-20, BOW-BGWC-23, BOW-BGWC-32, BOW-BGWC-42D and BOW-BGWC-50D. Since total radium is calculated from radium-226 and radium-228, and radium-226 was greater than the MDC, and based on professional and technical judgment, the total radium concentrations for this sample was reported with no qualifications.

4.2 Holding Times

The holding times for the radium-226 and radium-228 analyses of a water sample are 180 days from sample collection to analysis. The holding times were met for the sample analyses.

4.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Method blanks were reported for the radium-226 and radium-228 data. Radium-226 and radium-228 were not detected in the method blanks at or above the MDCs, with the following exceptions.

Radium-228 (0.591 pCi/L) in the method blank in batch 647678 was detected at a concentration greater than the MDC. Since the associated samples were nondetect, no qualifications were applied to the data.

Radium-228 (0.898 pCi/L) was detected in the method blank in batch 646984 at a concentration greater than the MDC. Since the mean difference was less than 2 between the blank and sample BOW-BGWA-47D, and the sample concentration was less than ten times the blank concentration, the radium-228 concentrations for sample BOW-BGWA-47D was UJ qualified as estimated less than the reported concentration. Therefore, the combined concentration in sample BOW-BGWA-47D was J qualified as estimated due to there being a detection of radium-226 in the sample.

Sample ID	Compound	Laboratory Result (pCi/L)	Laboratory Flag	Validation Result (pCi/L)	Validation Qualifier	Reason Code
BOW-BGWA-47D	Radium-228	0.886	NA	0.886	UJ	BL2

4.4 Matrix Spike/Matrix Spike Duplicate

MS/MSD pairs were not reported with data.

4.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCS/LCS duplicate (LCSD) pairs were reported for radium-226 and radium-228. The recovery and replicate error ratio (RER) [2 sigma (2σ)] results were within the laboratory specified acceptance criteria.

4.6 Laboratory Duplicate

Two sample set specific laboratory duplicates were reported for radium-226 using samples BOW-BOW-BGWA-6 and BOW-BGWC-40. The RER results were within the laboratory specified acceptance criteria.

Batch laboratory duplicates were also reported for radium-226. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

4.7 Tracers and Carriers

Carriers were reported for the radium-226 and radium-228 analyses and a tracer was reported for the radium-228 analyses. The recovery results were within the laboratory specified acceptance criteria.

4.8 Field Blank

Four field blanks BOW-AP1-FB-01, BOW-AP1-FB-02, BOW-AP1-FB-03 and BOW-AP1-FB-04 were collected with the sample set and analyzed for radium-226 and radium-228. Radium-226 and radium-228 were not detected in the field blanks at or above the MDCs, with the following exception.

Radium-228 (0.846 pCi/L) was detected in BOW-AP1-FB-02 at a concentration greater than the MDC. Since for the associated samples radium-2228 was either not detect at a concentration greater than the MDC or UJ qualified due to method blank contamination, no additional qualifications were applied to the data.

4.9 Equipment Blank

Two equipment blanks BOW-AP1-EB-01 and BOW-AP1-EB-02 were collected with the sample set and analyzed for radiochemistry. Radium-226 and Radium-228 were not detected in the equipment blanks at or above the MDCs.

4.10 Field Duplicate

Four field duplicates BOW-AP1-FD-01, BOW-AP1-FD-02, BOW-AP1-FD-03 and BOW-AP1-FD-04 were collected with the sample set. Acceptable precision [RER (1σ) < 3] was demonstrated between the field duplicates and the original samples BOW-BGWC-36D, BOW-BGWC-18, BOW-BGWC-25 and BOW-BGWC-41D, respectively.

4.11 Sensitivity

The samples were reported to the MDCs. No elevated non-detect results were reported.

DATA QUALIFIER DEFINITIONS

U The analyte was analyzed for, but was not detected at or above the reported sample quantitation limit. Upon application of the U qualifier to a reported result, the definition changes to "not detected at or above the reported result".

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

J+ The analyte was positively identified; however, the associated numerical value is likely to be higher than the concentration of the analyte in the sample due to positive bias of associated QC or calibration data or attributable to matrix interference.

J- The analyte was positively identified; however, the associated numerical value is likely to be lower than the concentration of the analyte in the sample due to negative bias of associated QC or calibration data or attributable to matrix interference.

UJ The analyte was not detected at or above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Subject: Stage 2A Data Validation - Level II Data Deliverables – Pace Analytical Services, LLC Project Numbers 92748202, 92748210, 92741037, 92749474 and 92749477

SITE: Plant Bowen Ash Pond 1

INTRODUCTION

This report summarizes the findings of the Stage 2A data validation of forty-seven aqueous samples, eight field duplicates, eight equipment blanks and eight field blanks collected 9 July 2024 and 15-16 and 19-23 August 2024 as part of the Plant Bowen Ash Pond on-site sampling event.

The samples were analyzed at Pace Analytical Services, LLC, Peachtree Corners, Georgia, for the following analytical tests:

- Calcium by United States (US) Environmental Protection Agency (EPA) Methods 3010A/6010D
- Metals by US EPA Methods 3005A/6020B
- Mercury by US EPA Method 7470A

The samples were analyzed at Pace Analytical Services, LLC, Asheville, North Carolina, for the following analytical tests:

- Anions (Chloride, Fluoride and Sulfate) by US EPA Method 300.0
- Total Dissolved Solids (TDS) by Standard Method 2540C

The samples were analyzed at Pace Analytical Services, LLC, Greensburg, Pennsylvania, for the following analytical tests:

- Radium-226 by US EPA Method 9315
- Radium-228 by US EPA Method 9320
- Total Radium by Calculation

EXECUTIVE SUMMARY

Overall, based on this Stage 2A data validation covering the quality control (QC) parameters listed below and based on the information provided, the data as qualified are usable for supporting project objectives. The qualified data should be used within the limitations of the qualifications. If there are results with two or more different qualifications due to multiple QC failures, the final qualification is reconciled in the electronic data deliverable (EDD) with qualifications.

The data were reviewed based on the pertinent methods referenced in the laboratory report, professional and technical judgment, and the following documents:

- United States (US) EPA Region IV Data Validation Standard Operating Procedures (US EPA Region IV, September 2011);
- USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review, November 2020 (EPA 542-R-20-006); and
- American National Standard, Verification and Validation of Radiological Data for use in Waste Management and Environmental Remediation, February 15, 2012 (ANSI/ANS-41.5-2012).

The following samples were analyzed and reported in the laboratory reports:

The samples were received within 0-6 degrees Celsius (ºC). No sample preservation issues were noted by the laboratory.

1.0 METALS

The samples were analyzed for metals by US EPA methods 3010A/6010D and 3005A/6020B. (Mercury was evaluated separately in Section 2.0, below).

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

1.1 Overall Assessment

The metals data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

1.2 Holding Time

The holding time for the metals analysis of a preserved water sample is 180 days from sample collection to analysis. The holding times were met for the sample analyses.

1.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The metals were not detected in the method blanks at or above the method detection limits (MDLs).

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Sample set specific MS/MSD pairs were reported, using samples BOW-PT-02, BOW-BGWC-17, BOW-BGWC-36D, BOW-BGWA-47D, BOW-BGWC-30, BOW-BGWC-52, BOW-BGWC-21 and BOW-BGWC-35D. The recovery and relative percent difference (RPD) results were within the laboratory specified acceptance criteria, with the following exceptions.

92741037: The recoveries of boron in the MS/MSD pair using sample BOW-PT-02 were low and outside of the laboratory specified acceptance criteria. Since the boron concentration in sample BOW-PT-02 was greater than four times the spike concentrations, no qualifications were applied to the data

92748202: The recoveries of calcium in the MS/MSD pairs using samples BOW-BGWC-17 and BOW-BGWC-36D were high and outside of the laboratory specified acceptance criteria. Since the calcium concentrations in samples BOW-BGWC-17 and BOW-BGWC-36D were greater than four times the spike concentrations, no qualifications were applied to the data.

Batch MS/MSD pairs were also reported for metals by US EPA methods 6010D and 6020B. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

1.5 Laboratory Control Sample (LCS)

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported with each batch. The recovery results were within the laboratory specified acceptance criteria.

1.6 Field Blank

Eight field blanks BOW-AP1-FB-01 (92741037), BOW-AP1-FB-01 (92749474), BOW-AP1-FB-01 (92749477), BOW-AP1-FB-08, BOW-AP1-FB-09, BOW-AP1-FB-12, BOW-AP1-FB-10 and BOW-AP1-FB-11 were collected with the sample set. Metals were not detected in the field blanks at or above the MDLs, with the following exceptions.

92749477: Boron (0.013 mg/L) was detected in field blank BOW-AP1-FB-01 at an estimated concentration greater than the MDL and less than the reporting limit (RL). Since the concentration in associated samples BOW-AP1-FD-01 and BOW-PZ-8 were greater than ten times the blank contamination, and based on technical and professional judgement, no qualifications were applied to the data.

92748202: Arsenic was detected in field blanks BOW-AP1-FB-12 (0.0041 mg/L) and BOW-AP1-FB-10 (0.00094 mg/L) at estimated concentrations greater than the MDLs and less than the RLs. Therefore, the estimated concentrations of arsenic in the associated samples were U qualified as estimated below the RL, and the concentrations of arsenic greater than the RL and less than ten times the field blank concentrations were J+ qualified as estimated with high bias.

Boron was detected in field blanks BOW-AP1-FB-12 (0.033 mg/L) and BOW-AP1-FB-11 (0.031 mg/L) at estimated concentrations greater than the MDLs and less than the RLs. Therefore, the estimated concentrations of boron in the associated samples were U qualified as estimated below the RL, and the concentrations of boron were J+ qualified as estimated with a high bias.

1.7 Equipment Blank

Eight equipment blanks BOW-AP1-FB-01 (92741037), BOW-AP1-EB-01 (92749474), BOW-AP1-EB-01 (92749477), BOW-AP1-EB-08, BOW-AP1-EB-09, BOW-AP1-EB-12, BOW-AP1-EB-10 and BOW-AP1-EB-11 were collected with the sample set. Metals were not detected in the equipment blanks at or above the MDLs, with the following exceptions.

92748202: Arsenic was detected in BOW-AP1-EB-10, and boron was detected in BOW-AP1-EB-11 and BOW-AP1-EB-12, all at estimated concentrations greater than the MDL and less than the RL. Since these arsenic and boron concentrations were previously qualified due to field blank contamination, no additional qualifications were applied to the data.

1.8 Field Duplicate

Eight field duplicates BOW-AP1-FD-01(92741037), BOW-AP1-FD-01 (92749474), BOW-AP1-FD-01 (92749477), BOW-AP1-FD-08, BOW-AP1-FD-09, BOW-AP1-FD-12, BOW-AP1-FD-10 and BOW-AP1-FD-11 were collected with the sample set. Acceptable precision (RPD $\leq$ 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-

PT-02, BOW-PT-02, BOW-PZ-8, BOW-BGWA-47D, BOW-BGWC-9, BOW-BGWC-30, BOW-BGWC-51 and BOW-BGWA-29, respectively, with the following exceptions.

Arsenic was detected at an estimated concentration greater than the MDL and less than the RL in sample BOW-BGWA-29 and not detected in field duplicate BOW-AP1-FD-11, resulting in a noncalculable RPD. Therefore, the estimated antimony concentration in sample BOW-BGWA-29 was J qualified as estimated and the nondetect antimony result in field duplicate BOW-AP1-FD-11 was UJ qualified as estimated less than the MDL.

Arsenic was detected at an estimated concentration greater than the MDL and less than the RL in field duplicate BOW-AP1-FD-08 and not detected in sample BOW-BGWA-47D, resulting in a noncalculable RPD. Therefore, the estimated arsenic concentration in field duplicate BOW-AP1-FD-08 was J qualified as estimated and the nondetect arsenic result in sample BOW-BGWA-47D was UJ qualified as estimated less than the MDL.

Antimony was detected at an estimated concentration greater than the MDL and less than the RL in field duplicate BOW-AP1-FD-10 and not detected in sample BOW-BGWC-51, resulting in a noncalculable RPD. Therefore, the estimated arsenic concentration in field duplicate BOW-AP1-FD-10 was J qualified as estimated and the nondetect arsenic result in sample BOW-BGWC-51 was UJ qualified as estimated less than the MDL.

NC- Not Calculable

1.9 Sensitivity

The samples were reported to the MDLs. Elevated non-detect results were not reported.

2.0 MERCURY

The samples were analyzed for mercury by US EPA method 7470A.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

2.1 Overall Assessment

The mercury data reported in this data set are considered usable for supporting project objectives. The analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

2.2 Holding Time

The holding time for the mercury analysis of a water sample is 28 days from sample collection to analysis. The holding times were met for the sample analyses.

2.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Mercury was not detected in the method blanks at or above the MDL.

2.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Sample set specific MS/MSD pairs were reported using samples BOW-BGWA-48D, BOW-AP1-EB-09 and BOW-AP1-FB-10. The recovery and RPD results were within the laboratory specified acceptance criteria.

2.5 Laboratory Control Sample

LCSs were analyzed at the frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported for each batch. The recovery results were within the laboratory specified acceptance criteria.

2.6 Field Blank

Five field blanks BOW-AP1-FB-08, BOW-AP1-FB-09, BOW-AP1-FB-12, BOW-AP1-FB-10 and BOW-AP1-FB-11 were collected with the sample set. Mercury was not detected in the field blanks at or above the MDL.

2.7 Equipment Blank

Five equipment blanks BOW-AP1-EB-08, BOW-AP1-EB-09, BOW-AP1-EB-12, BOW-AP1-EB-10 and BOW-AP1-EB-11 were collected with the sample set. Mercury was not detected in the equipment blanks at or above the MDL.

2.8 Field Duplicate

Five field duplicates BOW-AP1-FD-08, BOW-AP1-FD-09, BOW-AP1-FD-12, BOW-AP1-FD-10 and BOW-AP1-FD-11 were collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-BGWA-47D, BOW-BGWC-9, BOW-BGWC-30, BOW-BGWC-51, and BOW-BGWA-29, respectively.

2.9 Sensitivity

The samples were reported to the MDL. Elevated non-detect results were not reported.

3.0 WET CHEMISTRY

The samples were analyzed for TDS by Standard Method 2540C, alkalinity by Standard Method 2320B, sulfide by Standard Method 4500-S2D and anions (chloride, fluoride, and sulfate) by US EPA method 300.0.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

3.1 Overall Assessment

The wet chemistry data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

3.2 Holding Times

The holding time for the TDS analysis of a water sample is 7 days from sample collection to analysis. The holding time for the anions (chloride, fluoride, and sulfate) analysis of a water sample is 28 days from sample collection to analysis. The holding time for the alkalinity analysis of a water sample is 14 days from sample collection to analysis. The holding times were met for the sample analyses.

3.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The wet chemistry parameters were not detected in the method blanks at or above the MDLs.

3.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples).

Sample set specific MS/MSD pairs were reported for anions using samples BOW-BGWA-6, BOW-BGWC-17, BOW-AP1-FB-12, BOW-BGWC-52, BOW-BGWC-43D and BOW-BGWC-21. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exceptions.

The recoveries of sulfate in the MS/MSD pair using sample BOW-BGWC-17 were low and outside the laboratory specified acceptance criteria. Therefore, the concentration of sulfate in sample BOW-BGWC-17 was J- qualified as estimated.

The recoveries of chloride and sulfate in the MS/MSD pair using sample BOW-BGWC-43D were low and outside the laboratory specified acceptance criteria. Since the concentrations of chloride and sulfate in sample BOW-BGWC-43D were greater than four times the spike concentration, no qualifications were applied to the data.

The recoveries of sulfate in the MS/MSD pair using sample BOW-BGWC-21 were low and outside the laboratory specified acceptance criteria. Therefore, the concentration of sulfate in sample BOW-BGWC-21 was J- qualified as estimated.

Batch MS/MSD pairs were also reported for alkalinity and the anions. Since these were batch QC there was no impact on the data and qualifications were not applied.

3.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The recovery results were within the laboratory specified acceptance criteria.

3.6 Laboratory Duplicate

Sample set specific laboratory duplicates were reported for TDS using samples BOW-BGWC-9, BOW-BGWA-6, BOW-BGWC-25, BOW-BGWA-29, and BOW-BGWC-30. The RPD results were within the laboratory specified acceptance criteria.

Batch laboratory duplicates were also reported for TDS. Since these were batch QC, there was no impact on the data and qualifications were not applied.

3.7 Field Blank

Five field blanks BOW-AP1-FB-08, BOW-AP1-FB-09, BOW-AP1-FB-12, BOW-AP1-FB-10 and BOW-AP1-FB-11 were collected with the sample set. The wet chemistry parameters were not detected in the field blanks at or above the MDLs.

3.8 Equipment Blank

Five equipment blanks BOW-AP1-EB-08, BOW-AP1-EB-09, BOW-AP1-EB-12, BOW-AP1-EB-10 and BOW-AP1-EB-11 were collected with the sample set. The wet chemistry parameters were not detected in the equipment blanks at or above the MDLs.

3.9 Field Duplicate

Five field duplicates BOW-AP1-FD-08, BOW-AP1-FD-09, BOW-AP1-FD-12, BOW-AP1-FD-10 and BOW-AP1-FD-11 were collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicates and the original samples BOW-BGWA-47D, BOW-BGWC-9, BOW-BGWC-30, BOW-BGWC-51, and BOW-BGWA-29, respectively.

3.10 Sensitivity

The samples were reported to the MDLs for anions and to the RLs for alkalinity and TDS. Elevated non-detect results were not reported.

4.0 RADIOCHEMISTRY

The samples were analyzed for radium-226 by US EPA method 9315, radium-228 by US EPA method 9320 and total radium by calculation.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. 4.1 Overall Assessment

The radium-226 and radium-228 data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

4.1.1 Analysis Anomaly

Total radium was reported at the minimum detectable concentration (MDC) for radium-226 and radium-228. Radium-228 was detected greater than the MDC in samples BOW-AP1-EB-12, BOW-BGWC-12, and BOW-BGWC-23. Since total radium is calculated from radium-226 and radium-228, and radium-228 was greater than the MDC, and based on professional and technical judgment, the total radium concentrations for this sample was reported with no qualifications.

Total radium was reported at the MDC for radium-226 and radium-228. Radium-226 was detected greater than the MDC in samples BOW-AP1-FB-09, BOW-AP1-FD-12, BOW-BGWC-10, BOW-BGWC-21, BOW-BGWC-24 and BOW-BGWC-50D. Since total radium is calculated from radium-226 and radium-228, and radium-226 was greater than the MDC, and based on professional and technical judgment, the total radium concentrations for this sample was reported with no qualifications.

4.2 Holding Times

The holding times for the radium-226 and radium-228 analyses of a water sample are 180 days from sample collection to analysis. The holding times were met for the sample analyses.

4.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Method blanks were reported for the radium-226 and radium-228 data. Radium-226 and radium-228 were not detected in the method blanks at or above the MDCs, with the following exceptions.

Radium-228 (0.898 pCi/L) was detected in the method blank in batch 693289 at a concentration greater than the MDC. Since the mean difference was less than 2 between the blank and sample BOW-BGWC-49D, and the sample concentration was less than ten times the blank concentration, the radium-228 concentration for sample BOW-BGWC-49D was UJ qualified as estimated less than the reported concentration. Therefore, the combined radium 226 + 228 concentration in sample BOW-BGWC-49D was J qualified as estimated due to there being a detection of radium-226 in the sample.

Since radium-228 was not detected above the MDC in associated samples BOW-AP1-EB-11, BOW-AP1-FB-11, BOW-AP1-FD-11 and BOW-BGWC-43D, no qualifications were applied to the data.

4.4 Matrix Spike/Matrix Spike Duplicate

MS/MSD pairs were not reported with data.

4.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCS/LCS duplicate (LCSD) pairs were reported for radium-226 and radium-228. The recovery and replicate error ratio (RER) [2 sigma (2σ)] results were within the laboratory specified acceptance criteria, with the following exception.

The RER result (2.265σ) for radium-228 in the LCS/LCSD pair in batch 691960 was high and outside of method specified acceptance criteria. Therefore, the concentrations of radium-228 AND combined radium-226 + radium-228 in associated samples BOW-AP1-EB-09 and BOW-BGWC-12 were J qualified as estimated.

Sample ID	Compound	Laboratory Result (pCi/L)	Laboratory Flag	Validation Result (pCi/L)	Validation Qualifier	Reason Code

4.6 Laboratory Duplicate

One sample set specific laboratory duplicate was reported for radium-229 using samples BOW-BGWC-19. The RER results were within the laboratory specified acceptance criteria.

Batch laboratory duplicates were also reported for radium-226. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

4.7 Tracers and Carriers

Carriers were reported for the radium-226 and radium-228 analyses, and a tracer was reported for the radium-228 analyses. The recovery results were within the laboratory specified acceptance criteria.

4.8 Field Blank

Five field blanks BOW-AP1-FB-08, BOW-AP1-FB-09, BOW-AP1-FB-12, BOW-AP1-FB-10 and BOW-AP1-FB-11 were collected with the sample set and analyzed for radium-226 and radium-228. Radium-226 and radium-228 were not detected in the field blanks at or above the MDCs, with the following exception.

Radium-226 (0.406 pCi/L) was detected in BOW-AP1-FB-09 at a concentration greater than the MDC. Since radium-226 was not detected in the associated samples, no additional qualifications were applied to the data.

4.9 Equipment Blank

Five equipment blanks BOW-AP1-EB-08, BOW-AP1-EB-09, BOW-AP1-EB-12, BOW-AP1-EB-10 and BOW-AP1-EB-11 were collected with the sample set and analyzed for radiochemistry. Radium-226 and Radium-228 were not detected in the equipment blanks at or above the MDCs, with the following exceptions.

Radium-228 (0.790 pCi/L) was detected in equipment blank, BOW-AP1-EB-09, at a concentration greater than the MDC. Since the mean difference was less than 2 between the equipment blank and associated sample BOW-BGWC-12, and the sample concentration was less than ten times the blank concentration, the radium-228 concentration for sample BOW-BGWC-12 was UJ qualified as estimated less than the reported concentration. In addition, the combined radium 226 + 228 concentration in sample BOW-BGWC-12 was J qualified as estimated due to there being a detection of radium-226 in the sample.

Radium-228 (0.796 pCi/L) was detected in equipment blank, BOW-AP1-EB-12, at a concentration greater than the MDC. Since the mean difference was less than 2 between the equipment blank and associated samples BOW-BGWC-23, BOW-BGWC-38D, and BOW-BGWC-39 and the sample concentration was less than ten times the blank concentration, the radium-228 concentration for samples BOW-BGWC-23, BOW-BGWC-38D, and BOW-BGWC-39 were UJ qualified as estimated less than the reported concentration. Since the mean difference was less than 2 between the equipment blank and associated samples BOW-BGWC-35D and BOW-BGWC-37D and the sample concentration was less than ten times the blank concentration, the radium-228 concentration for samples BOW-BGWC-35D and BOW-BGWC-37D were J qualified as estimated. In addition, the combined radium 226 + 228 concentrations in samples BOW-BGWC-23, BOW-BGWC-35D, BOW-BGWC-37D, BOW-BGWC-38D and BOW-BGWC-39 were J qualified as estimated due to there being a detection of radium-226 in the sample.

Since radium-228 was not detected above the MDC in associated samples BOW-AP1-FB-09, BOW-AP1-FD-09, BOW-BGWC-16, BOW-BGWC-17, BOW-BGWC-18, BOW-BGWC-19, BOW-BGWC-31 and BOW-BGWC-9, no qualifications were applied to the data.

4.10 Field Duplicate

Five field duplicates BOW-AP1-FD-08, BOW-AP1-FD-09, BOW-AP1-FD-12, BOW-AP1-FD-10 and BOW-AP1-FD-11 were collected with the sample set. Acceptable precision [RER (1σ) < 3] was demonstrated between the field duplicates and the original samples BOW-BGWA-47D, BOW-BGWC-9, BOW-BGWC-30, BOW-BGWC-51, and BOW-BGWA-29, respectively.

4.11 Sensitivity

The samples were reported to the MDCs. No elevated non-detect results were reported.

DATA QUALIFIER DEFINITIONS

U The analyte was analyzed for, but was not detected at or above the reported sample quantitation limit. Upon application of the U qualifier to a reported result, the definition changes to "not detected at or above the reported result".

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

J+ The analyte was positively identified; however, the associated numerical value is likely to be higher than the concentration of the analyte in the sample due to positive bias of associated QC or calibration data or attributable to matrix interference.

J- The analyte was positively identified; however, the associated numerical value is likely to be lower than the concentration of the analyte in the sample due to negative bias of associated QC or calibration data or attributable to matrix interference.

UJ The analyte was not detected at or above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Subject:	**Stage 2A Data Validation - Level II Data Deliverables – Pace Analytical Services, LLC Project Numbers 92767533 and 92767545**

SITE: Plant Bowen Ash Pond 1 (OTH)

INTRODUCTION

This report summarizes the findings of the Stage 2A data validation of one aqueous sample, one field duplicate, one equipment blank and one field blank collected 3 December 2024 as part of the Plant Bowen Ash Pond on-site sampling event.

The samples were analyzed at Pace Analytical Services, LLC, Peachtree Corners, Georgia, for the following analytical tests:

- Calcium by United States (US) Environmental Protection Agency (EPA) Methods 3010A/6010D
- Metals by US EPA Methods 3005A/6020B
- Mercury by US EPA Method 7470A
- Total Dissolved Solids (TDS) by Standard Method (SM_ 2540C

The samples were analyzed at Pace Analytical Services, LLC, Asheville, North Carolina, for the following analytical tests:

- Alkalinity by SM 2320B
- Sulfide by SM 4500-S2D
- Anions (Chloride, Fluoride and Sulfate) by US EPA Method 300.0

The samples were analyzed at Pace Analytical Services, LLC, Greensburg, Pennsylvania, for the following analytical tests:

- Radium-226 by US EPA Method 9315
- Radium-228 by US EPA Method 9320
- Total Radium by Calculation

EXECUTIVE SUMMARY

Overall, based on this Stage 2A data validation covering the quality control (QC) parameters listed below and based on the information provided, the data as qualified are usable for supporting project objectives. The qualified data should be used within the limitations of the qualifications. If there are results with two or more different qualifications due to multiple QC failures, the final qualification is reconciled in the electronic data deliverable (EDD) with qualifications.

The data were reviewed based on the pertinent methods referenced in the laboratory report, professional and technical judgment, and the following documents:

- United States (US) EPA Region IV Data Validation Standard Operating Procedures (US EPA Region IV, September 2011);
- USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review, November 2020 (EPA 542-R-20-006); and
- American National Standard, Verification and Validation of Radiological Data for use in Waste Management and Environmental Remediation, February 15, 2012 (ANSI/ANS-41.5-2012).

The following samples were analyzed and reported in the laboratory reports:

Laboratory IDs	Client IDs
92767533001	BOW-BGWC-53D
92767545001	
92767533002	BOW-AP1-FD-13
92767545002	

Laboratory IDs	Client IDs
92767533003	BOW-AP1-FB-13
92767545003	
92767533004	BOW-AP1-EB-13
92767545004	

The samples were received within 0-6 degrees Celsius (°C). No sample preservation issues were noted by the laboratory.

1.0 METALS

The samples were analyzed for metals by US EPA methods 3010A/6010D and 3005A/6020B. (Mercury was evaluated separately in Section 2.0, below).

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

1.1 Overall Assessment

The metals data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

1.2 Holding Time

The holding time for the metals analysis of a preserved water sample is 180 days from sample collection to analysis. The holding times were met for the sample analyses.

1.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The metals were not detected in the method blanks at or above the method detection limits (MDLs), with the following exception.

Arsenic (0.0012 mg/L) was detected in the method blank in batch 900816 at an estimated concentration greater than the MDL and less than the RL. Therefore, the estimated concentrations of arsenic in samples BOW-AP1-EB-13 and BOW-AP1-FB-13 were U qualified as estimated below the RL.

Sample ID	Compound	Laboratory Result (mg/L)	Laboratory Flag	Validation Result (mg/L)	Validation Qualifier*	Reason Code**
BOW-AP1-EB-13	Arsenic	0.0043	J,B	0.0050	U	BC
BOW-AP1-FB-13	Arsenic	0.0050	J,B	0.0050	U	BC

mg/L-milligrams per liter
J-The result is less than the RL, but greater than or equal to the MDL, and the concentration is an approximate value
B-Analyte was detected in the associated method blank.
* Validation qualifiers are defined in Attachment 1 at the end of this report
**Reason codes are defined in Attachment 2 at the end of this report

1.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Two sample set specific MS/MSD pairs were reported, using samples BOW-BGWC-53D and BOW-AP1-FD-13. The recovery and relative percent difference (RPD) results were within the laboratory specified acceptance criteria, with the following exceptions.

The recoveries of calcium, magnesium and sodium in the MS/MSD pair using sample BOW-BGWC-53D were low and high and outside of the laboratory specified acceptance criteria. Since the calcium, magnesium and sodium concentrations in sample BOW-BGWC-53D were greater than four times the spike concentrations, no qualifications were applied to the data.

1.5 Laboratory Control Sample (LCS)

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported with each batch. The recovery results were within the laboratory specified acceptance criteria.

1.6 Field Blank

One field blank BOW-AP1-FB-13 was collected with the sample set. Metals were not detected in the field blank at or above the MDLs, with the following exceptions.

Arsenic (0.0050 mg/L) was detected in BOW-AP1-EB-13 at an estimated concentration greater than the MDL and less than the RL. Since the arsenic concentration for BOW-AP1-EB-13 was qualified due to method blank contamination, no additional qualifications were applied to the data.

Boron (0.050 mg/L) was detected in field blank BOW-AP1-FB-13 at an estimated concentration greater than the MDL and less than the reporting limit (RL). Therefore, the estimated concentration of boron in BOW-AP1-EB-13 was U qualified as not detected at or above the RL. Since the concentrations of boron in associated samples BOW-AP1-FD-13 and BOW-BGWC-53D were greater than ten times the blank contamination, and based on technical and professional judgement, no qualifications were applied to those data.

Sample ID	Compound	Laboratory Result (mg/L)	Laboratory Flag	Validation Result (mg/L)	Validation Qualifier	Reason Code
BOW-AP1-EB-13	Boron	0.025	J	0.040	U	BC

mg/L-milligrams per liter
J-The result is less than the RL, but greater than or equal to the MDL, and the concentration is an approximate value
* Validation qualifiers are defined in Attachment 1 at the end of this report
**Reason codes are defined in Attachment 2 at the end of this report

1.7 Equipment Blank

One equipment blank BOW-AP1-EB-13 was collected with the sample set. Metals were not detected in the equipment blanks at or above the MDLs, with the following exceptions.

Arsenic (0.0043 mg/L) was detected in BOW-AP1-EB-13 at an estimated concentration greater than the MDL and less than the RL. Since the arsenic concentration for BOW-AP1-EB-13 was qualified due to method blank contamination, no additional qualifications were applied to the data.

Boron (0.025 mg/L) was detected in BOW-AP1-EB-13 at an estimated concentration greater than the MDL and less than the RL. Since the boron concentration for BOW-AP1-EB-13 was qualified due to field blank contamination, no additional qualifications were applied to the data.

1.8 Field Duplicate

One field duplicate BOW-AP1-FD-13 was collected with the sample set. Acceptable precision (RPD $\leq$ 20% or difference < RL) was demonstrated between the field duplicate and the original sample BOW-BGWC-53D, with the following exception.

Selenium was detected at an estimated concentration greater than the MDL and less than the RL in field duplicate BOW-AP1-FD-13 and not detected in sample BOW-BGWC-53D, resulting in a noncalculable RPD. Therefore, the estimated selenium concentration in field duplicate BOW-AP1-FD-13 was J qualified as estimated and the nondetect selenium result in sample BOW-BGWC-53D was UJ qualified as estimated less than the MDL.

Sample	Analyte	Laboratory Result (mg/l)	Laboratory Flag	RPD	Validation Result (mg/l)	Validation Qualifier	Reason Code
BOW-AP1-FD-13	Selenium	0.0013	J	NC	0.0013	J	RPDF2
BOW-BGWC-53D	Selenium	0.00096	U		0.00096	UJ	RPDF2

mg/L-milligrams per liter
J - The result is less than the RL, but greater than or equal to the MDL, and the concentration is an approximate value.
U- The analyte was analyzed for but was not detected at or above the reported sample quantitation limit.
NC- Not Calculable

1.9 Sensitivity

The samples were reported to the MDLs. Elevated non-detect results were not reported.

2.0 MERCURY

The samples were analyzed for mercury by US EPA method 7470A.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

2.1 Overall Assessment

The mercury data reported in this data set are considered usable for supporting project objectives. The analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

2.2 Holding Time

The holding time for the mercury analysis of a water sample is 28 days from sample collection to analysis. The holding times were met for the sample analyses.

2.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Mercury was not detected in the method blanks at or above the MDL.

2.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). One batch MS/MSD pair was reported. Since these were batch QC, the results do not affect the samples in this data set and qualifications were not applied to the data.

2.5 Laboratory Control Sample

LCSs were analyzed at the frequency for the number and types of samples analyzed (one per batch of 20 samples). LCSs were reported for each batch. The recovery results were within the laboratory specified acceptance criteria.

2.6 Field Blank

One field blank BOW-AP1-FB-13 was collected with the sample set. Mercury was not detected in the field blanks at or above the MDL.

2.7 Equipment Blank

One equipment blank BOW-AP1-EB-13 was collected with the sample set. Mercury was not detected in the equipment blanks at or above the MDL.

2.8 Field Duplicate

One field duplicate BOW-AP1-FD-13 was collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicate and the original sample BOW-BGWC-53D.

2.9 Sensitivity

The samples were reported to the MDL. Elevated non-detect results were not reported.

3.0 WET CHEMISTRY

The samples were analyzed for TDS by Standard Method 2540C, alkalinity by Standard Method 2320B, sulfide by Standard Method 4500-S2D and anions (chloride, fluoride, and sulfate) by US EPA method 300.0.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

3.1 Overall Assessment

The wet chemistry data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

3.2 Holding Times

The holding time for the TDS analysis of a water sample is 7 days from sample collection to analysis. The holding time for the anions (chloride, fluoride, and sulfate) analysis of a water sample is 28 days from sample collection to analysis. The holding time for the alkalinity analysis of a water sample is 14 days from sample collection to analysis. The holding times were met for the sample analyses.

3.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The wet chemistry parameters were not detected in the method blanks at or above the MDLs.

3.4 Matrix Spike/Matrix Spike Duplicate

MS/MSDs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples).

Sample set specific MS/MSD pairs were reported for total alkalinity using samples BOW-BGWC-53D and BOW-AP1-FD-13. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exceptions.

A sample set specific MS/MSD pair was reported for sulfide using sample using sample BOW-BGWC-53D. The recovery and RPD results were within the laboratory specified acceptance criteria.

A sample set specific MS/MSD pair was reported for anions using sample using sample BOW-BGWC-53D. The recovery and RPD results were within the laboratory specified acceptance criteria, with the following exception.

One or both recoveries of total alkalinity in the MS/MSD pairs using samples BOW-BGWC-53D and BOW-AP1-FD-13 were low and outside the laboratory specified acceptance criteria. Therefore, the concentrations of total alkalinity and bicarbonate alkalinity were J- qualified as estimated and the nondetect results of carbonate alkalinity were UJ qualified as estimated below the RL in samples BOW-BGWC-53D and BOW-AP1-FD-13.

The MS recovery of sulfate in the MS/MSD pair using sample BOW-BGWC-53D was high and outside the laboratory specified acceptance criteria. Since the concentration of sulfate in sample BOW-BGWC-53D was greater than four times the spike concentration, no qualifications were applied to the data.

Batch MS/MSD pairs were also reported for sulfide and the anions. Since these were batch QC there was no impact on the data and qualifications were not applied.

NA-not applicable
M1- Laboratory flag indicating the matrix spike recovery exceeded laboratory specified acceptance criteria

3.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). The recovery results were within the laboratory specified acceptance criteria.

3.6 Laboratory Duplicate

A sample set specific laboratory duplicate was reported for TDS using sample BOW-BGWC-53D. The RPD result was within the laboratory specified acceptance criteria.

A batch laboratory duplicate was also reported for TDS. Since these were batch QC, there was no impact on the data and qualifications were not applied.

3.7 Field Blank

One field blank BOW-AP1-FB-13 was collected with the sample set. The wet chemistry parameters were not detected in the field blanks at or above the MDLs, with the following exception.

TDS (66.0 mg/L) was detected in the field blank at a concentration greater than the RL. Since TDS was either not detected or detected at concentrations greater than ten times the field blank concentration, no qualifications were applied to the data.

3.8 Equipment Blank

One equipment blank BOW-AP1-EB-13 was collected with the sample set. The wet chemistry parameters were not detected in the equipment blanks at or above the MDLs.

3.9 Field Duplicate

One field duplicate BOW-AP1-FD-13 was collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicate and the original sample BOW-BGWC-53D.

3.10 Sensitivity

The samples were reported to the MDLs for anions and to the RLs for alkalinity and TDS. Elevated non-detect results were not reported.

4.0 RADIOCHEMISTRY

The samples were analyzed for radium-226 by US EPA method 9315, radium-228 by US EPA method 9320 and total radium by calculation.

The areas of data review are listed below. A leading check mark (✓) indicates an area of review in which the data were acceptable. A preceding crossed circle (⊗) signifies areas where issues were raised during the course of the validation review and should be considered to determine any impact on data quality and usability.

4.1 Overall Assessment

The radium-226 and radium-228 data reported in this data set are considered usable for supporting project objectives. The results are considered valid; the analytical completeness defined as the ratio of the number of valid analytical results (valid analytical results include values qualified as estimated) to the total number of analytical results requested on samples submitted for this analysis, for this data set is 100%.

4.1.1 Analysis Anomaly

Total radium was reported at the MDC for radium-226 and radium-228. Radium-226 was detected greater than the MDC in samples BOW-AP1-FD-13 and BOW-BGWC-53D. Since total radium is calculated from radium-226 and radium-228, and radium-226 was greater than the MDC, and based on professional and technical judgment, the total radium concentrations for this sample was reported with no qualifications.

Sample ID	Compound	Laboratory Result (pCi/L)	Laboratory Flag	Validation Result (pCi/L)	Validation Qualifier	Reason Code
BOW-AP1-FD-13	Combined Radium 226 + 228	0.870	U	0.870	NA	RO1

pCi/L-picocuries per liter
U-not detected at or above the MDC
NA-not applicable

4.2 Holding Times

The holding times for the radium-226 and radium-228 analyses of a water sample are 180 days from sample collection to analysis. The holding times were met for the sample analyses.

4.3 Method Blank

Method blanks were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). Method blanks were reported for the radium-226 and radium-228 data. Radium-226 and radium-228 were not detected in the method blanks at or above the MDCs.

4.4 Matrix Spike/Matrix Spike Duplicate

MS/MSD pairs were not reported with data.

4.5 Laboratory Control Sample

LCSs were analyzed at the proper frequency for the number and types of samples analyzed (one per batch of 20 samples). LCS/LCS duplicate (LCSD) pairs were reported for radium-226 and radium-228. The recovery and replicate error ratio (RER) [2 sigma (2σ)] results were within the laboratory specified acceptance criteria.

4.6 Laboratory Duplicate

Laboratory duplicates were not reported with the sample set.

4.7 Tracers and Carriers

Carriers were reported for the radium-226 and radium-228 analyses, and a tracer was reported for the radium-228 analyses. The recovery results were within the laboratory specified acceptance criteria.

4.8 Field Blank

One field blank BOW-AP1-FB-13 was collected with the sample set and analyzed for radium-226 and radium-228. Radium-226 and radium-228 were not detected in the field blanks at or above the MDCs.

4.9 Equipment Blank

One equipment blank BOW-AP1-EB-13 was collected with the sample set with the sample set and analyzed for radiochemistry. Radium-226 and Radium-228 were not detected in the equipment blanks at or above the MDCs, with the following exceptions.

Radium-228 (1.62 pCi/L) and combined radium 226 + 228 (1.68 pCi/L) were detected in equipment blank, BOW-AP1-EB-13, at a concentration greater than the MDC. Since radium-228

and combined radium 226 + 228 were not detected at or above the MDC in the associated samples, no qualifications were applied to the data.

4.10 Field Duplicate

One field duplicate BOW-AP1-FD-13 was collected with the sample set. Acceptable precision (RPD < 20% or difference < RL) was demonstrated between the field duplicate and the original sample BOW-BGWC-53D.

4.11 Sensitivity

The samples were reported to the MDCs. No elevated non-detect results were reported.

DATA VALIDATION QUALIFIER DEFINITIONS AND INTERPRETATION KEY

DATA QUALIFIER DEFINITIONS

U The analyte was analyzed for, but was not detected at or above the reported sample quantitation limit. Upon application of the U qualifier to a reported result, the definition changes to "not detected at or above the reported result".

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

J+ The analyte was positively identified; however, the associated numerical value is likely to be higher than the concentration of the analyte in the sample due to positive bias of associated QC or calibration data or attributable to matrix interference.

J- The analyte was positively identified; however, the associated numerical value is likely to be lower than the concentration of the analyte in the sample due to negative bias of associated QC or calibration data or attributable to matrix interference.

UJ The analyte was not detected at or above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

Low-Flow Test Report:

Test Date / Time: 8/21/2024 12:46:16 PM
Project: Plant Bowen AP August 2024
Operator Name: Kevin Stephenson

Location Name: BGWA-33 **Well Diameter: 2 in** **Casing Type: PVC** **Screen Length: 10 ft** **Top of Screen: 70.84 ft** **Total Depth: 80.84 ft** **Initial Depth to Water: 76.84 ft**	**Pump Type: QED Bladder** **Tubing Type: LDPE** **Pump Intake From TOC: 79.84 m** **Estimated Total Volume Pumped: 2000 ml** **Flow Cell Volume: 90 ml** **Final Flow Rate: 100 ml/min** **Final Draw Down: 1.59 ft**	**Instrument Used: Aqua TROLL 400** **Serial Number: 1120055**

Test Notes:
Pre-purged .5 liter. WL started in the screen. Historical events show that well doesn t recover after evacuating. Pumping ceased for sufficient water volume for sampling. Ants in well with higher than normal turbidity.

Re: Plant Bowen Ash Pond 1 (AP-1)
August 2024 Sample Event

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater data for the Groundwater Detection and Assessment Monitoring Semi-Annual August 2024 sample event for Georgia Power Company's Plant Bowen AP-1. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling for the Appendix III and IV parameters began in 2016 for the majority of wells, and at least 8 background samples were collected at each of the groundwater monitoring wells. All wells were sampled most recently in August 2024. Sampling is conducted on a semi-annual basis for all constituents. A list of all parameters is provided below.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient well:** BGWA-2, BGWA-29, BGWA-33, BGWA-47D, and BGWA-48D
- **Downgradient wells:** BGWC-7, BGWC-8, BGWC-9, BGWC-10, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20,

BGWC-21, BGWC-22, BGWC-23, BGWC-24, BGWC-25, BGWC-30, BGWC-51, and BGWC-52

- **Assessment wells:** BGWA-6, BGWC-31, BGWC-32, BGWC-34D, BGWC-35D, BGWC-36D, BGWC-37D, BGWC-38D, BGWC-39, BGWC-40, BGWC-41D, BGWC-42D, BGWC-43D, BGWC-44D, BGWC-49D, and BGWC-50D

Sampling for assessment wells started at various dates ranging from June 2016 to March 2021 as listed below:

- June 2016 - BGWA-6
- October 2018 - BGWC-31, BGWC-32, BGWC-34D, BGWC-35D, and BGWC-36D
- May 2019 - BGWC-37D and BGWC-38D
- December 2019 - BGWC-39 and BGWC-40
- May 2020 - BGWC-41D, BGWC-42D, BGWC-43D, and BGWC-44D
- March 2021 – BGWC-49D and BGWC-50D

Data from assessment wells are analyzed using confidence intervals for Appendix IV constituents when a minimum of 4 samples are available as mentioned above. Currently, all assessment wells have the required minimum samples and, therefore, are evaluated using confidence intervals. Data from all assessment wells are plotted on the time series graphs and box plots.

Note that boron and cobalt at well BGWC-22 were sampled in July 2024 as a part of the pre-design investigation, and pH at well BGWC-22 was also recorded in July 2024.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) **-** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) **–** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient and assessment well/constituent pairs with 100% non-detects follows this letter. For all

constituents, a substitution of the most recent reporting limit is used for non-detect data which generally gives the most conservative limit in each case. In the cases of antimony, arsenic, and cadmium, historic reporting limits were either higher than or equal to the MCL or CCR-Rule specified levels; therefore, a substitution of the most recent (and lower) respective reporting limits were substituted across all wells for these constituents. Similarly, dilution factors during the previous event for beryllium and lithium resulted in elevated reporting limits for some wells; therefore, the most recent (and lower) reporting limit were substituted across all wells for these constituents.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Based on the previous screening, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the 2017 screening to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

The original background screening was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Interwell prediction limits, combined with a 1-of-2 resample plan, were recommended.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the

same parameter. While data were further tested for intrawell eligibility during the screening, interwell methods are used for all Appendix III constituents in accordance with Georgia EPD requirements.

Summary of Statistical Methods – Appendix III and IV Parameters

Based on the evaluation for state and federal regulatory requirements, the following methods were selected for Appendix III and IV constituents:

- Appendix III: Interwell prediction limits, combined with a 1-of-2 resample plan, for each Appendix III constituent
- Appendix IV: Confidence intervals on downgradient well data compared against Groundwater Protection Standards (GWPS) for each Appendix IV constituent

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. Parametric prediction limits (or tolerance limits or confidence intervals as applicable) are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric prediction limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The following approaches are used for handling non-detects (USEPA, 2009):

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to

accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. While this was not required for this report, in some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Statistical Analysis of Appendix III Parameters – August 2024

All Appendix III parameters were analyzed using interwell prediction limits. Background (upgradient) well data were reassessed for potential outliers during this analysis. No additional Appendix III values were flagged as an outlier in the database for Appendix III parameters. Values in background which were previously flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through August 2024 (Figure D). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The August 2024 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result. Therefore, no exceedance is noted and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Several prediction limit exceedances were noted for Appendix III parameters and a summary table of the interwell prediction limits follows this letter.

As mentioned above, boron and pH at well BGWC-22 were sampled in July 2024 as a part of the pre-design investigation. The July 2024 observation for pH of 6.43 s.u. exceeded the lower interwell prediction limit of 6.555 s.u. and the July 2024 observation for boron of 16.5 mg/L exceeded the upper interwell prediction limit of 0.043 mg/L.

Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are statistically increasing, decreasing, or stable (Figure E). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of variability in groundwater unrelated to practices at the site. A summary along with complete graphical results of the trend tests follows this report. Statistically significant trends were noted for the following well/constituent pairs:

Increasing

- Boron: BGWC-12, BGWC-14A, BGWC-20, BGWC-22, BGWC-23, and BGWC-25
- Calcium: BGWA-2 (upgradient), BGWC-33 (upgradient), BGWC-12, BGWC-14A, BGWC-16, BGWC-20, BGWC-22, and BGWC-23
- Chloride: BGWC-10, BGWC-22, BGWC-23, and BGWC-25
- Sulfate: BGWA-2 (upgradient), BGWC-12, and BGWC-16
- TDS: BGWA-2 (upgradient), BGWC-12, BGWC-16, BGWC-20, BGWC-22, and BGWC-23

Decreasing

- Boron: BGWC-7, BGWC-9, BGWC-17, BGWC-18, BGWC-19, BGWC-30, BGWC-51, and BGWC-52
- Chloride: BGWA-29 (upgradient), BGWA-47D (upgradient), BGWC-12, BGWC-16, BGWC-24, BGWC-30, BGWC-51, BGWC-52, and BGWC-9
- pH: BGWA-2 (upgradient), BGWA-33 (upgradient), BGWA-47D (upgradient), BGWC-16, BGWC-22, and BGWC-24
- Sulfate: BGWC-7 and BGWC-24
- TDS: BGWC-7 and BGWC-24

Statistical Analysis of Appendix IV Parameters – August 2024

For Appendix IV parameters, confidence intervals for each downgradient well/constituent were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. Well/constituent pairs containing 100% non-detects do not require analysis. Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis. No additional measurements were flagged

and all previously flagged measurements were confirmed. A summary of flagged outliers follows this report (Figure C).

Interwell Upper Tolerance Limits

Interwell tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through August 2024 for Appendix IV constituents (Figure F). Parametric tolerance limits are calculated, with a target of 95% confidence and 95% coverage, when data follow a normal or transformed-normal distribution, such as for combined radium 226 + 228. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were constructed using the highest background measurement. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples.

Groundwater Protection Standards

The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a). On July 30, 2018, US EPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Effective on February 22, 2022, Georgia EPD incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a). In accordance with the updated Rules, the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title
- Where an MCL has not been established for a constituent, Federal and State CCR Rules specify levels for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

Following Georgia EPD Rule requirements and the Federal CCR requirements, GWPS were established for statistical comparison of Appendix IV constituents for this sample event (Figure G).

Confidence Intervals

To complete the statistical comparison of downgradient well data to GWPS, confidence intervals were constructed for the Appendix IV constituents in each downgradient and

assessment well using all available data through August 2024 (Figure H). As mentioned above, cobalt at well BGWC-22 was also sampled in July 2024 as a part of the pre-design investigation and that observation is included in the confidence intervals.

Confidence intervals were compared to the GWPS prepared as described above. These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were used for Appendix IV parameters. Nonparametric confidence intervals, which use the appropriate order statistics depending on the sample size as interval limits, were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The lower confidence limit, which is constructed with 99% confidence for parametric confidence intervals, is compared to the GWPS prepared as described above. The achievable confidence level associated with nonparametric confidence intervals is dependent upon the number samples available.

Only when the entire confidence interval is above a GWPS is the downgradient well/constituent pair considered to exceed its respective standard. If there is an exceedance of the GWPS, a statistically significant level (SSL) exceedance is identified. Note that due to an increasing trend for cobalt at downgradient well BGWC-16 and lithium at BGWC-20, the records were truncated to eliminate the trend and only the most recent observations were used to construct the confidence interval (USEPA Unified Guidance, 2009, Chapter 7). Summaries of the confidence intervals follow this letter and exceedances were identified for the following well/constituent pairs:

- Arsenic: BGWC-34D
- Cobalt: BGWC-16 and BGWC-22
- Molybdenum: BGWC-43D

Trend Test Evaluation – Appendix IV

Data at wells with confidence interval exceedances are further evaluated using the Sen's Slope/Mann Kendall trend test at the 95% confidence level to determine whether concentrations are statistically increasing, decreasing, or stable (Figure I). Although the trend tests for Assessment monitoring pairs were previously evaluated using 99% confidence, the 95% confidence level more rapidly identifies statistically significant trends. Additionally, the 95% confidence level is recommended in cases with limited sample sizes and, particularly, for new assessment wells. Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site for the same constituents. When trends are present in upgradient wells, it is an indication of variability

in groundwater quality unrelated to practices at the site. A summary of the Appendix IV trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Arsenic: BGWA-33 (upgradient)
- Cobalt: BGWC-16 and BGWC-22

Decreasing

- Molybdenum: BGWA-33 (upgradient)

Summary

Observations from the August 2024 sample event were compared to established interwell prediction limits for Appendix III constituents. Several statistically significant increases were identified and may be seen on the summary table following this letter. When confidence intervals were constructed on downgradient wells for Appendix IV constituents and compared to respective GWPS, the following exceedances were identified:

- Arsenic: BGWC-34D
- Cobalt: BGWC-16 and BGWC-22
- Molybdenum: BGWC-43D

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Bowen AP-1. If you have any questions or comments, please feel free to contact us.

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 93 background values. 19.35% NDs. Annual per-constituent alpha = 0.008367. Individual comparison alpha = 0.0002211 (1 of 2). Comparing 19 points to limit.

1. INTRODUCTION

1.1 Purpose

This document presents an addendum to the alternate source demonstration (ASD) submitted to the Georgia Environmental Protection Division (GA EPD) on May 1, 2023, for the statistically significant level (SSL) of arsenic (As) above the groundwater protection standard (GWPS) of 0.01 milligrams per liter (mg/L) detected in vertical assessment well BGWC-37D located at the Georgia Power Company (Georgia Power) Plant Bowen (Site) Ash Pond 1 (AP-1). An SSL of As above the GWPS was first identified in BGWC-37D following statistical evaluation of available groundwater data after the July/August 2022 assessment monitoring event; the evaluation was presented in the *Annual Groundwater Monitoring and Corrective Action Report* and submitted to the GA EPD on January 31, 2023 (Geosyntec, 2023). Since submittal of the ASD on May 1, 2023 (GEOS ID#752261), supplemental data have been collected which provide additional evidence that an error in statistical evaluation associated with the inappropriate application of non-parametric confidence limits caused the previously identified SSL of As in BGWC-37D. The supplemental data presented in this ASD Addendum support the conclusions provided in the 2023 ASD.

The 2023 ASD and this ASD Addendum have been prepared pursuant to regulations in Title 40 Code of Federal Regulations (CFR) Part 257 Subpart D [the Federal Coal Combustion Residuals (CCR) Rule], specifically § 257.95(g)(3)(ii), which allows the owner or operator to "demonstrate that a source other than the CCR unit caused the contamination, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality." Moreover, the 2023 ASD and this ASD Addendum also serve as an ASD under the Georgia regulations per Rule 391-3-4-.10(6) of the Georgia Administrative Code, which incorporates § 257.95(g)(3)(ii) by reference.

1.2 Summary of 2023 ASD

As detailed in the 2023 ASD, the SSL of As identified in well BGWC-37D is not associated with a release from AP-1 but is instead caused by an error in statistical evaluation associated with the inappropriate application of non-parametric confidence

limits. Various lines of evidence supporting this conclusion were presented in the prior ASD. Key points are summarized below.

- The initial non-parametric confidence limit identified the SSL of As in BGWC-37D following the July/August 2022 assessment monitoring event. However, in accordance with the United States Environmental Protection Agency (USEPA) *Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance* (Unified Guidance) (USEPA, 2009), preparation of non-parametric confidence intervals is only necessary when parametric methods are not applicable. A parametric confidence interval was subsequently determined to be the appropriate statistical approach for evaluating As concentrations in BGWC-37D. Application of the appropriate confidence interval indicates that the lower confidence limit (LCL) is below the GWPS. Therefore, an SSL of As should not have been identified.

- The As groundwater concentrations in BGWC-37D have been decreasing since sampling began in February 2020, and a decreasing concentration trend that is statistically significant at the 99% confidence level has been identified. The most current As concentration, reported for the January/February 2024 assessment monitoring event, is below the established GWPS. This statistically significant decreasing trend is not indicative of a release from AP-1.

1.3 Summary of ASD Addendum

- Once the correct method for determining the confidence interval was applied, the LCL has consistently remained below the GWPS during the past 4 consecutive assessment monitoring events, including the most recent event conducted in January/February 2024.

- Using all of the available As data reported for BGWC-37D between the initial sampling in February 2020 and the most recent assessment monitoring event conducted in January/February 2024, a statistically significant decreasing trend continues to be identified for As.

- The concentrations of As in BGWC-37D have consistently remained below the GWPS during the three most recent consecutive assessment monitoring events[1].

1.4 Site Description

Plant Bowen is a four-unit, coal-fired, electric-generating facility that commenced operations in the 1970s. The plant is located nine miles southwest of Cartersville in Bartow County, Georgia. The plant is bordered by the Etowah River to the north and east, and sparsely populated, forested, rural and industrial land on the south and west (**Figure 1**).

AP-1 at the Site occupies an area of approximately 254 acres. In preparation for AP-1 closure, the plant completed the conversion to dry ash handling in early 2019, and AP-1 no longer receives ash. Georgia Power submitted to GA EPD a notice of intent (NOI) stating that waste stream flows are no longer directed to AP-1, effective December 31, 2020. Georgia Power will close AP-1 by excavation and consolidation of CCR material into an approximately 90-acre lined, multi-cell storage facility situated within the current footprint of AP-1. Closure activities will be conducted in accordance with § 257.102 and corresponding Rule 391-3-4-.10(7)(b). The proposed closure approach provides a source control measure that reduces the potential for migration of CCR constituents to groundwater. Details of the closure approach have been summarized in the Amended Written Closure Plan and published in 2018 to Georgia Power's CCR Rule Compliance website. On February 17, 2022, GA EPD issued a CCR Permit (008-021D(CCR)) for the closure of Plant Bowen AP-1.

1.5 Groundwater Monitoring and Basis of Statistically Significant Levels

Georgia Power initiated an assessment of corrective measures (ACM) program at AP-1 in June 2019. BGWC-37D, shown on **Figure 2**, was installed as a vertical assessment well for detection well BGWC-22 and was sampled for the constituents listed in Appendix III and Appendix IV as part of the ACM activities.

Statistical analysis of the July/August 2022 assessment monitoring groundwater data identified an SSL of As in BGWC-37D in excess of the GWPS. Details of the analysis and supporting data are presented in the *2022 Annual Groundwater Monitoring and Corrective Action Report* (Geosyntec, 2023). However, the SSL was incorrectly

[1] Semiannual assessment monitoring events include January/February 2023, July/August 2023 and January/February 2024.

identified due to an error in statistical evaluation as described in the 2023 ASD and this ASD Addendum.

2. ALTERNATE SOURCE DEMONSTRATION

Based on review of Site information, the SSL of As identified in BGWC-37D is not associated with a release from AP-1 but instead was initially identified due to an error in statistical evaluation (i.e., the inappropriate use of non-parametric confidence interval). This report provides the following information supporting this conclusion.

2.1 Corrected Arsenic Confidence Interval Below the GWPS

In some cases when calculating confidence intervals, the required adjustments to fit the data to a transformed normal distribution result in the LCLs being a negative number. In accordance with the USEPA Unified Guidance, if that occurs non-parametric confidence intervals are used, which are bound by reported high and low measurements within a given well. During calculation of the confidence intervals following the July/August 2022 assessment monitoring event, all confidence intervals for As were inadvertently constructed as non-parametric, rather than on a case-by-case basis. In the case of BGWC-37D, the parametric LCL for As was greater than zero; therefore, the parametric LCL for As should have been compared to the GWPS and found to be below the GWPS. Therefore, the SSL for As should not have been identified.

Three additional semiannual assessment monitoring events were completed following the July/August 2022 assessment monitoring event. Arsenic concentrations were statistically compared to the GWPS using a confidence interval constructed using all the available data, including the most recent monitoring data for BGWC-37D. The confidence intervals constructed using the most current groundwater dataset following each of the additional semiannual assessment monitoring events, including the January/February 2024 assessment monitoring event, do not identify an SSL of As in BGWC-37D.

Statistical Analysis Reports have been provided in the 2022 and 2023 Annual Groundwater Monitoring and Corrective Action Reports (Geosyntec, 2023 and 2024). The GSC-provided revised Statistical Analysis Report for the July/August 2022 monitoring event is included in **Appendix A.** A summary of the confidence interval determined for As in BGWC-37D from the January/February 2024 monitoring event are included in **Appendix B**.

2.2 Presence of a Statistically Significant Decreasing Arsenic Trend

A time series plot for As in BGWC-37D using all of the available As data reported for BGWC-37D between the initial sampling in February 2020 and the most recent assessment monitoring event conducted in January/February 2024 is included as **Figure 3**. As shown on **Figure 3**, the As groundwater concentrations in BGWC-37D have been decreasing since sampling for As began in February 2020. The Sanitas™ groundwater statistical software[2] was used to evaluate the presence of a time-trend for As in BGWC-37D using Sen's method and the statistical significance of the trend was evaluated using a Mann Kendall test. Results are presented in **Appendix C.** Results of the evaluation indicate a decreasing concentration trend that is statistically significant at the 99% confidence level. Based on the presence of a statistically significant trend, it is unlikely an SSL of As would be identified in BGWC-37D.

2.3 Arsenic Concentrations are below the GWPS

A summary of arsenic concentrations detected at BGWC-37D is included in **Table 1**. During each of the three additional semiannual assessment monitoring events completed following the July/August 2022 assessment monitoring event, the concentrations of arsenic detected at BGWC-37D have consistently remained below the GWPS (0.01 mg/L).

[2] Sanitas™ is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations and guidance as recommended in the USEPA Unified Guidance

3. CONCLUSIONS

Based on the information presented in the 2023 ASD and this ASD Addendum, the SSL of As identified in BGWC-37D is attributed to an error in statistical evaluation and is not due to a release from AP-1:

- Corrected Arsenic Confidence Interval Below the GWPS

  The initial non-parametric confidence interval identified the SSL of As in BGWC-37D following the July/August 2022 groundwater monitoring event. However, application of non-parametric confidence intervals was inappropriate. Application of the appropriate parametric confidence interval indicates the LCL is below the GWPS. Therefore, the identification of an SSL of As was incorrect, and was not due to a release from AP-1.

  More recent monitoring data have been collected since the initial SSL was incorrectly identified. The confidence interval constructed using the most current groundwater data sets, including the January/February 2024 assessment monitoring event, also do not identify an SSL of As in BGWC-37D.

- Presence of a Statistically Significant Decreasing Arsenic Trend

  Evaluation of the most recent assessment monitoring results from January/February 2024 identified a statistically significant decreasing trend in As concentration at the 99% confidence level for BGWC-37D, which is also not indicative of a release from AP-1.

- Three Most Recent Monitoring Events Below GWPS

  The concentrations of As have consistently remained below the GWPS in BGWC-37D for each of the three most recent semiannual assessment monitoring events.

A copy of the ASD Addendum will be provided as an appendix to the 2024 Semiannual Groundwater Monitoring and Corrective Action Report due to GA EPD in August 2024.

Re: Plant Bowen Ash Pond 1 (AP-1)
July/August 2022 Sample Event

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of groundwater data for the Groundwater Detection and Assessment Monitoring Semi-Annual July/August 2022 sample event for Georgia Power Company's Plant Bowen AP-1. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling for the Appendix III and IV parameters began in 2016, and at least 8 background samples were collected at each of the groundwater monitoring wells with exceptions noted below. All wells were sampled most recently in July/August 2022, except for well BGWC-24, which includes resamples collected in October 2022 as described below. Sampling is conducted on a semi-annual basis for all constituents. A list of all parameters is provided below.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient well:** BGWA-2, BGWA-29, BGWA-33, BGWA-47D, and BGWA-48D

- **Downgradient wells:** BGWC-7, BGWC-8, BGWC-9, BGWC-10, BGWC-12, BGWC-14A, BGWC-16, BGWC-17, BGWC-18, BGWC-19, BGWC-20, BGWC-21, BGWC-22, BGWC-23, BGWC-24, BGWC-25, BGWC-30, BGWC-51, and BGWC-52
- **Assessment wells:** BGWA-6, BGWC-31, BGWC-32, BGWC-34D, BGWC-35D, BGWC-36D, BGWC-37D, BGWC-38D, BGWC-39, BGWC-40, BGWC-41D, BGWC-42D, BGWC-43D, BGWC-44D, BGWC-49D, and BGWC-50D

Sampling for upgradient well BGWA-33 began in April 2019 and for upgradient wells BGWA-47D and BGWA-48D in May 2020. Data from these wells are pooled with upgradient wells for construction of interwell statistical limits. Downgradient wells BGWC-51 and BGWC-52 were first sampled in January 2021 and currently have a maximum of 6 samples; therefore, these wells are evaluated with confidence intervals for Appendix IV constituents, which require a minimum of 4 samples. Data at these wells will be evaluated for the Appendix III constituents when a minimum of 8 background samples have been collected.

Sampling for assessment wells started at various dates ranging from June 2016 to March 2021 as listed below:

- June 2016 - BGWA-6
- October 2018 - BGWC-31, BGWC-32, BGWC-34D, BGWC-35D, and BGWC-36D
- May 2019 - BGWC-37D and BGWC-38D
- December 2019 - BGWC-39 and BGWC-40
- May 2020 - BGWC-41D, BGWC-42D, BGWC-43D, and BGWC-44D
- March 2021 – BGWC-49D and BGWC-50D

Data from assessment wells are analyzed using confidence intervals for Appendix IV constituents when a minimum of 4 samples are available as mentioned above. Currently assessment wells BGWC-49D and BGWC-50D have the required minimum and, therefore, are evaluated using confidence intervals. Data from all assessment wells are plotted on the time series graphs and box plots.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting.

The CCR program consists of the following constituents listed below. The terms "constituent" and "parameter" are interchangeable.

- **Appendix III** (Detection Monitoring) **-** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) **–** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient and assessment well/constituent pairs with 100% non-detects follows this letter. For all constituents, a substitution of the most recent reporting limit is used for non-detect data which generally gives the most conservative limit in each case. In the time series plots, a single reporting limit substitution is used across all wells for a given parameter since the wells are plotted as a group.

While upgradient well BGWA-33 was not sampled for combined radium 226 + 228 during the July/August 2022 sample event, historical data are included with pooled upgradient well data for the construction of interwell tolerance limits. Additionally, spurious values were noted for well BGWC-24 during the July/August 2022; therefore, resamples for all constituents at this well, with the exception of combined radium 226 + 228, were collected in October 2022. Any values from the July/August 2022 sample event that were uncharacteristic of existing concentrations at well BGWC-24 were flagged as outliers.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Based on the previous screening, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the 2017 screening to demonstrate that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

The original background screening was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Interwell prediction limits, combined with a 1-of-2 resample plan, were recommended.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. While data were further tested for intrawell eligibility during the screening, interwell methods are used for all Appendix III constituents in accordance with Georgia EPD requirements.

Summary of Statistical Methods – Appendix III and IV Parameters

Based on the evaluation for state and federal regulatory requirements, the following methods were selected for Appendix III and IV constituents:

- Appendix III: Interwell prediction limits, combined with a 1-of-2 resample plan, for each Appendix III constituent
- Appendix IV: Confidence intervals on downgradient well data compared against Groundwater Protection Standards (GWPS) for each Appendix IV constituent

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. Parametric prediction limits (or tolerance limits or confidence intervals as applicable) are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric prediction limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The following approaches are used for handling non-detects (USEPA, 2009):

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).

- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. While this was not required for this report, in some cases, deselecting the earlier portion of data may be necessary prior to construction of limits so that resulting statistical limits are conservative (lower) from a regulatory perspective and capable of rapidly detecting changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Statistical Analysis of Appendix III Parameters – July/August 2022

All Appendix III parameters were analyzed using interwell prediction limits. Background (upgradient) well data were re-assessed for potential outliers during this analysis. No new Appendix III values were flagged as an outlier in the database for Appendix III parameters. Values in background which were previously flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through July/August 2022 (Figure D). Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The July/August 2022 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result. Therefore, no exceedance is noted and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Several prediction limit exceedances were noted for Appendix III parameters and a summary table of the interwell prediction limits follows this letter.

Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are statistically increasing, decreasing, or stable (Figure E). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Upgradient trends are an indication of natural variability in groundwater unrelated to practices at the site. A summary along with complete graphical results of the trend tests follows this report. Statistically significant trends were noted for the following well/constituent pairs:

Increasing

- Boron: BGWC-12, BGWC-22, BGWC-23, and BGWC-25
- Calcium: BGWA-2 (upgradient), BGWC-12, BGWC-16, BGWC-20, BGWC-22, and BGWC-23
- Chloride: BGWC-10, BGWC-22, and BGWC-23
- Sulfate: BGWA-2 (upgradient), BGWC-12, BGWC-16, and BGWA-47D (upgradient)
- TDS: BGWC-12, BGWC-22, and BGWC-23

Decreasing

- Boron: BGWC-7, BGWC-9, BGWC-18, and BGWC-30
- Chloride: BGWC-9, BGWC-12, BGWC-16, BGWA-29 (upgradient), BGWC-24, and BGWC-30
- pH: BGWC-16, BGWC-24, and BGWA-47D (upgradient)
- Sulfate: BGWC-7, BGWC-9, and BGWC-19
- TDS: BGWC-7 and BGWC-30

Statistical Analysis of Appendix IV Parameters – July/August 2022

For Appendix IV parameters, confidence intervals for each downgradient well/constituent were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. Well/constituent pairs that have 100% non-detects or only trace values below the reporting limits do not require analysis. Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis.

During the previous analysis, a high reporting limit 0.15 mg/L for lithium at wells BGWC-32, BGWC-37D, BGWC-40, and BGWC-42D was flagged in order to maintain statistical limits that are conservative (i.e., lower) from a regulatory perspective. A high reported value of 0.015 mg/L during the July/August 2022 sample event for antimony at downgradient well BGWC-24 was flagged as an outlier. All resamples collected during October 2022 at this well were included in the confidence intervals as discussed earlier. A summary of flagged outliers follows this report (Figure C).

Interwell Upper Tolerance Limits

First, interwell tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through August 2022 for Appendix IV constituents (Figure F). Parametric tolerance limits are used when data follow a normal or transformed-normal distribution. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used.

Groundwater Protection Standards

The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a). On July 30, 2018, US EPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Effective on February 22, 2022, Georgia EPD incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a). In accordance with the updated Rules, the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title

- Where an MCL has not been established for a constituent, Federal and State CCR Rules specify levels for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

Following Georgia EPD Rule requirements and the Federal CCR requirements, GWPS were established for statistical comparison of Appendix IV constituents for this sample event (Figure G).

Confidence Intervals

To complete the statistical comparison of downgradient well data to GWPS, confidence intervals were constructed for the Appendix IV constituents in each downgradient and assessment well using all available data through July/August 2022.

The Sanitas software was used to calculate both the tolerance limits and the confidence intervals (Figure H). Due to the required transformations to fit the data to a transformed normal distribution, the lower confidence limits resulted in negative numbers for some well/constituent pairs. Therefore, non-parametric confidence intervals, which are bound by reported high and low measurements within a given well, were constructed for these particular cases and may be found at the end of Figure H. This is a more conservative approach in that the lower confidence limit reflects the lowest reported measurement in the data set rather than a negative number.

Confidence intervals were compared to the GWPS prepared as described above. Only when the entire confidence interval is above a GWPS is the downgradient well/constituent pair considered to exceed its respective standard. If there is an exceedance of the GWPS, a statistically significant level (SSL) exceedance is identified. Summaries of the confidence intervals follow this letter and exceedances were identified for the following well/constituent pairs:

- Arsenic: BGWC-34D
- Cobalt: BGWC-22
- Molybdenum: BGWC-43D

Trend Test Evaluation – Appendix IV

Data at wells with confidence interval exceedances are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically

increasing, decreasing, or stable (Figure I). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site for the same constituents. When trends are present in upgradient trends, it is an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of the Appendix IV trend test results follows this letter. A statistically significant increasing trend was identified for the following well/constituent pair:

- Cobalt: BGWC-22

Background Data Summary (based on square root transformation) (after Kaplan-Meier Adjustment): Mean=0.1151, Std. Dev.=0.03777, n=73, 16.44% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9687, critical = 0.956. Kappa = 2.147 (c=7, w=19, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.000396. Comparing 17 points to limit. Assumes 2 future values.

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 73 background values. Annual per-constituent alpha = 0.01333. Individual comparison alpha = 0.000353 (1 of 2). Comparing 17 points to limit. Assumes 2 future values.

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

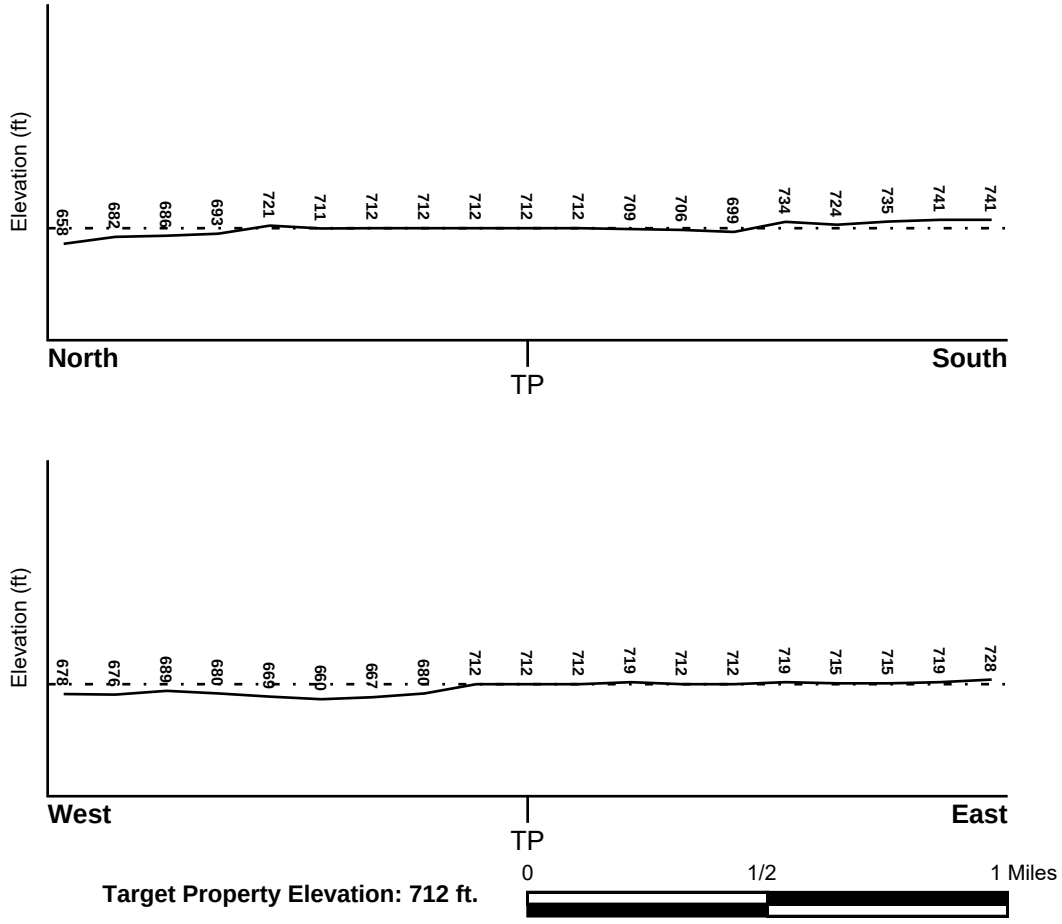
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General West

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	TALLAPOOSA
Soil Surface Texture:	gravelly - silt loam
Hydrologic Group:	Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: LOW

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 20 inches

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: loam
silt loam

Surficial Soil Types: loam
silt loam

Shallow Soil Types: silt loam
sandy clay loam

Deeper Soil Types: loamy fine sand

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.
