## QUALIFIERS

Project: MCDONOUGH BACKGROUND

Pace Project No.: 92608499

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

BC The same analyte was detected in an associated blank at a concentration above 1/2 the reporting limit but below the laboratory reporting limit.

D3 Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.

M1 Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.

R1 RPD value was outside control limits.

RE: Project: MCDONOUGH BACKGROUND RAD  
Pace Project No.: 92608485

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory between June 08, 2022 and June 10, 2022. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Nicole D'Oleo  
nicole.d'oleo@pacelabs.com

## QUALIFIERS

Project: MCDONOUGH BACKGROUND RAD  
Pace Project No.: 92608485

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.  
ND - Not Detected at or above adjusted reporting limit.  
TNTC - Too Numerous To Count  
J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.  
MDL - Adjusted Method Detection Limit.  
PQL - Practical Quantitation Limit.  
RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.  
S - Surrogate  
1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.  
Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.  
LCS(D) - Laboratory Control Sample (Duplicate)  
MS(D) - Matrix Spike (Duplicate)  
DUP - Sample Duplicate  
RPD - Relative Percent Difference  
NC - Not Calculable.  
SG - Silica Gel - Clean-Up  
U - Indicates the compound was analyzed for, but not detected.  
Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.  
A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.  
N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.  
Reported results are not rounded until the final step prior to reporting. Therefore, calculated parameters that are typically reported as "Total" may vary slightly from the sum of the reported component parameters.  
Act - Activity  
Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).  
Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)  
(MDC) - Minimum Detectable Concentration  
Trac - Tracer Recovery (%)  
Carr - Carrier Recovery (%)  
Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.  
TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

B0 Analyte was detected in an associated blank at a concentration greater than the MDL.

**APPENDIX B**

Data Validation Summary  
September 2021

---

## Quality Control Review of Analytical Data- Ash Pond AP-2, 3/4 Submitted by Pace Analytical Services, LLC September 2021

This narrative presents results of the quality control (QC) data review performed on analytical data submitted by Pace Analytical Services, LLC. for groundwater samples collected at Plant McDonough CCR Ash Pond AP-2, 3/4 (Site) between September 8, 2021 and September 16, 2021. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1. In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D - Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detection monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Test methods included Inductively Coupled Plasma- Mass Spectrometry (ICP-MS) (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Inductively Coupled Plasma (ICP) (6010D), Determination of Inorganic Anions By Ion Chromatography (USEPA Method 300.0), Total Dissolved Solids (TDS) (Standard Methods 2540C), Radium-226 (USEPA Method 9315) and Radium-228 (USEPA Method 9320).

Data were reviewed in accordance with the US EPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program (CLP) Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0), US EPA Region IV Data Validation Standard Operating Procedures for CLP Mercury Data by Cold Vapor Atomic Absorption (September 2011, Rev. 2.0), the National Functional Guidelines for Inorganic Superfund Methods Data Review (November 2020), and US Department of Energy, Evaluation of Radiochemical Data Usability (April 1997). The review included an assessment of the results for completeness, precision (laboratory and field duplicates, matrix spike/matrix spike duplicates), accuracy (laboratory control samples and matrix spike samples), and blank contamination (including field and laboratory blanks). Additionally, sample procedures, holding times and chains-of-custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytic methodology, method-specific criteria or professional judgment was used.

### DATA QUALITY OBJECTIVES

<b>Laboratory Precision:</b>	Laboratory goals for precision were met.
<b>Field Precision:</b>	Field goals for precision were met.
<b>Accuracy:</b>	Laboratory goals for accuracy were met with the exception of lithium, chloride, fluoride, and sulfate as described in the qualification sections below.
<b>Detection Limits:</b>	Project goals for detection limits were met. Certain samples were diluted due to elevated concentrations of target analytes. Dilutions do not require qualifications based on USEPA guidelines. Detection and reporting limits of non-detect compounds are elevated proportional to the dilution when undiluted sample results are not provided by the laboratory. The data usability of diluted results was evaluated by the data user in the context of site-wide characterization.
<b>Completeness:</b>	There were no rejected analytical results for this event, resulting in a completion of 100%.

**Holding Times:** All holding time requirements were met in accordance with specific analytical methods, with the exception of TDS, as described in the qualification section below.

## QUALIFICATIONS

In general, chemical results for the samples collected at the Site were qualified on the basis of precision or accuracy, or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the data validation process.

- J** The analyte was reported above the method detection limit; however, the concentration reported is an estimated value.
- U** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. Although these qualifications were applied to some data from samples collected at the site and reported in SDGs 92560136, 92560137, 92560138, 92560139, 92560765, 92560766, 92560768, 92560774, 92561190 and 92561195 qualifications may not have been required or applied to all samples collected. A summary of sample qualifications can be found in Table 2.

- The TDS result in sample B-56 from SDG 92560768 was qualified as estimated (J) as the sample had to be re-analyzed outside of holding time. The original TDS result was deemed un-reportable by the lab due to a suspected manufacturing error of laboratory materials.
- Certain chloride and fluoride results from SDGs 92560768 and 92560774 were qualified as estimated and biased high (J+) as the associated matrix spike/matrix spike duplicate (MS/MSD) recoveries were above the QC criteria.
- Certain lithium, chloride, fluoride, and sulfate results from SDGs 92560768 and 92560774 were qualified as estimated and biased low (J-) as the associated matrix spike/matrix spike duplicate (MS/MSD) recoveries were below the QC criteria.
- Certain radium-228, radium-226, and total radium results in SDGs 92560765 and 92560766 were qualified as non-detect (U) when either radium-226 or radium-228 was detected at a similar concentration in an associated blank sample. As shown in Table 2, the minimum detectable concentration (MDC) was raised to the sample result as part of the (U) qualification process.
- The total radium result in SDG 92560765 was qualified estimated biased high (J+) for associated blank contaminations.

Golder reviewed the data from samples collected at Plant McDonough CCR Ash Pond AP-2, 3/4 between September 8, 2021 and September 16, 2021 in accordance with the analytical methods, the laboratory specific QC criteria, and the guidelines. As described above, 100% of the results were acceptable for project use.

**APPENDIX B**

**Data Validation Summary**  
**January 2022**

---

**Quality Control Review of Analytical Data- Ash Pond AP-2 and 3/4  
Submitted by Pace Analytical Services, LLC  
January and June 2022**

This narrative presents results of the quality control (QC) data review performed on analytical data submitted by Pace Analytical Services, LLC. for groundwater samples collected at Plant McDonough CCR Ash Pond AP-2 and 3/4 (Site) between January 18, 2022 and June 9, 2022. The chemical data were reviewed to identify quality issues which could affect the use of the data for decision making purposes.

Information regarding the primary sample locations, analytical parameters, QC samples, sampling dates, and laboratory sample delivery group (SDG) designations is summarized in Table 1. In accordance with groundwater monitoring and corrective action procedures discussed in Title 40 CFR, Subpart D - Standards for the Disposal of Coal Combustion Residuals in Landfills and Surface Impoundments, the samples were analyzed for detection monitoring constituents listed in 40 CFR, Part 257, Appendix III and assessment monitoring constituents listed in 40 CFR, Part 257, Appendix IV. Groundwater samples were also analyzed for alkalinity. Test methods included Inductively Coupled Plasma- Mass Spectrometry (ICP-MS) (USEPA Method 6020B), Mercury in Liquid Wastes (USEPA Method 7470A), Inductively Coupled Plasma (ICP) (6010D), Determination of Inorganic Anions By Ion Chromatography (USEPA Method 300.0), Total Dissolved Solids (TDS) (Standard Methods 2540C), Radium-226 (USEPA Method 9315) and Radium-228 (USEPA Method 9320). Additional surface water samples were collected and analyzed for USEPA Method 6020B, 6010D, 300.0, TDS, Standard Methods 4500-CO2 Carbon Dioxide (Bicarbonate Alkalinity) and Alkalinity by Titration through Standard Method 2320B (SM2320B).

Data were reviewed in accordance with the US EPA Region IV Data Validation Standard Operating Procedures for Contract Laboratory Program (CLP) Inorganic Data by Inductively Coupled Plasma – Atomic Emission Spectroscopy and Inductively Coupled Plasma – Mass Spectroscopy (September 2011, Rev. 2.0), US EPA Region IV Data Validation Standard Operating Procedures for CLP Mercury Data by Cold Vapor Atomic Absorption (September 2011, Rev. 2.0), the National Functional Guidelines for Inorganic Superfund Methods Data Review (November 2020), and US Department of Energy, Evaluation of Radiochemical Data Usability (April 1997). The review included an assessment of the results for completeness, precision (laboratory and field duplicates, matrix spike/matrix spike duplicates), accuracy (laboratory control samples and matrix spike samples), and blank contamination (including field and laboratory blanks). Additionally, sample procedures, holding times and chains-of-custody were reviewed. Where there was a discrepancy between the QC criteria in the guidelines and the QC criterion established in the analytic methodology, method-specific criteria or professional judgment was used.

## **DATA QUALITY OBJECTIVES**

<b>Laboratory Precision:</b>	Laboratory goals for precision were met, with the exception of fluoride.
<b>Field Precision:</b>	Field goals for precision were met.
<b>Accuracy:</b>	Laboratory goals for accuracy were met with the exception of chloride, fluoride, sulfate, and alkalinity as described in the qualification sections below.
<b>Detection Limits:</b>	Project goals for detection limits were met. Certain samples were diluted due to elevated concentrations of target analytes. Dilutions do not require qualifications based on USEPA guidelines. Detection and reporting limits of non-detect compounds are elevated proportional to the dilution when undiluted sample results are not provided by the laboratory. The data

usability of diluted results was evaluated by the data user in the context of site-wide characterization.

**Completeness:** There were no rejected analytical results for this event, resulting in a completion of 100%.

**Holding Times:** All holding time requirements were met in accordance with specific analytical methods.

## QUALIFICATIONS

In general, chemical results for the samples collected at the Site were qualified on the basis of precision or accuracy, or on the basis of professional judgment. The following definitions provide brief explanations of the qualifiers which may have been assigned to data by the laboratory during the data validation process.

- J** The analyte was reported above the method detection limit; however, the concentration reported is an estimated value.
  
- U** The analyte was not detected above the method detection limit.

The data generated as part of this sampling event met the QC criteria established in the respective analytical methods and data validation guidelines except as specified below. Although these qualifications were applied to some data from samples collected at the site and reported in SDGs 92583500, 92583576, 92583585, 92583603, 92583950, 92583951, 92583952, 92583953, 92583955, 92583957, 92584543, 92584718, and 92608499 qualifications may not have been required or applied to all samples collected. A summary of sample qualifications can be found in Table 2.

- Certain chloride, fluoride, and sulfate results from SDGs 92583603, 92583953, 92583585 and 92583957 were qualified as estimated and biased high (J+) as the associated matrix spike/matrix spike duplicate (MS/MSD) recoveries were above the QC criteria.
- Certain alkalinity and sulfate results from SDGs 92583955, 92583953 and 92583957 were qualified as estimated and biased low (J-) as the associated matrix spike/matrix spike duplicate (MS/MSD) recoveries were below the QC criteria.
- Certain antimony and arsenic results in SDG 92583955 were qualified as non-detect (U) when the analyte was detected at a similar level in an associated blank sample. As shown in Table 2, if the original sample results were below the reporting limit (RL), the results were qualified as non-detect (U) and the results were raised to the RL.
- Fluoride in sample DGWC-2, from SDGs 92583953, was qualified as estimated non-detect value (UJ) as the associated matrix spike recovered outside acceptance criteria and the RPD recovered above the QC criteria.

Golder reviewed the data from samples collected at Plant McDonough CCR Ash Pond AP-2 and 3/4 between January 18, 2022 and June 9, 2022 in accordance with the analytical methods, the laboratory specific QC criteria, and the guidelines. As described above, 100% of the results were acceptable for project use.

Craig Tronzo  
Pace Analytical Services, LLC - Asheville NC  
2225 Riverside Drive  
Asheville NC 28804

VELAP ID: 460222

Dear Craig Tronzo:

The Division of Consolidated Laboratory Services (DCLS) has accredited Pace Analytical Services, LLC - Asheville NC pursuant to the provisions of IVAC30-46 and The NELAC Institute (TNI) 2009 Standard. Certificate number 11380 and the corresponding Scope of Accreditation are enclosed. This certificate expires 06/14/2022. The certificate must be conspicuously displayed in the laboratory along with the associated Scope of Accreditation.

Please note that your laboratory is required to notify the Virginia Environmental Laboratory Accreditation Program (VELAP) in writing of any changes in key accreditation criteria within 30 calendar days of the change per IVAC30-46-90 A. This requirement includes changes in ownership, location, key personnel, and major instrumentation.

To maintain accreditation, the laboratory must continue to comply with IVAC30-46. This includes ongoing satisfactory proficiency testing. The method checklists used by VELAP in the on-site assessment process are available upon request as a supplement to internal audits.

Please direct all correspondences and questions regarding accreditation to your laboratory's lead assessor, Ila Meyer-Fritzsche, at [ila.meyer-fritzsche@dgs.virginia.gov](mailto:ila.meyer-fritzsche@dgs.virginia.gov) or (804) 648-4480 x306.

Sincerely yours,

Cathy Westerman  
Manager, Laboratory Certification Program

FACE ANALYTICAL SERVICES, LLC-ATLANTA, GA  
 112 TECHNOLOGY PARKWAY  
 PLACEMORE CORNERS, GA 30092

has completed with Florida Administrative Code 64E-1  
 for the certification of environmental samples in the following categories:

DRINKING WATER - MICROBIOLOGY, DRINKING WATER - PRIMARY INORGANIC CONSTITUENTS, DRINKING WATER - SECONDARY INORGANIC  
 CONTAMINANTS, NONPOTABLE WATER - GENERAL CHEMISTRY, NONPOTABLE WATER - METALS, NONPOTABLE WATER - MICROBIOLOGY,  
 SOIL AND CHEMICAL MATERIALS - GENERAL CHEMISTRY, SOIL AND CHEMICAL MATERIALS - METALS, SOIL AND CHEMICAL MATERIALS -  
 MICROBIOLOGY

Continued certification is contingent upon successful ongoing compliance with the NELAP Standards and FAC Rule 64E-1  
 regulations. Specific methods and analytes certified are listed on the Laboratory Scope of Accreditation for this laboratory and  
 are online at the Bureau of Public Health Laboratories, P. O. Box 212, Tallahassee, Florida 32304. Clients and customers are  
 urged to verify with this agency the laboratory's certification status in Florida for particular methods and analytes.

Date Issued: July 01, 2021      Expiration Date: June 30, 2022

**APPENDIX C**

**Piezometer Installation (DGWC-121, B-122D, B-123D)  
and Abandonment (B-84) Report**

June 2, 2022

Project No. 166849621

**Ms. Lauren Hartley, PG**

Southern Company Services  
241 Ralph McGill Blvd NE  
Atlanta, GA 30308  
JAbraham@southernco.com

**WELL AND PIEZOMETER INSTALLATION (DGWC-121, B-122D, B-123D) AND ABANDONMENT (B-84) REPORT, GEORGIA POWER COMPANY - PLANT MCDONOUGH, SMYRNA, GEORGIA**

Dear Ms. Hartley:

Golder Associates USA Inc. (Golder) is submitting this *Piezometer and Well Installation and Abandonment Report* to Southern Company Services, Inc. (SCS) and Georgia Power Company (Georgia Power), which documents the construction of two piezometers and one monitoring well, and abandonment of one piezometer at Plant McDonough in Smyrna, Georgia (Site). Piezometer construction activities were performed in general accordance with the standards described in the Resource Conservation and Recovery Act (RCRA) Technical Enforcement Guidance Document (1986) and the Georgia Water Wells Standards Act of 1985. The installation and abandonment of the piezometers was conducted under the oversight and direction of Rachel Kirkman, a Georgia Registered Professional Geologist (PG).

The field activities for this investigation were performed in March 2022 through April 2022. The field work consisted of the installation and development of one (1) monitoring well and two (2) piezometers, which were installed for purposes of delineation of target constituents for Coal Combustion Residuals (CCR) compliance monitoring in groundwater. Due to construction activities, piezometer B-84 was abandoned in April 2022. Metro Engineering & Surveying (Metro) conducted a survey of the installed wells and piezometers in May 2022. A summary of the activities is presented below. Figure 1 presents the location of each of the newly installed piezometers.

### **Monitoring Well and Piezometer Drilling and Construction Activities**

Monitoring well DGWC-121 and piezometers B-122D and B-123D were drilled and installed by Cascade Drilling, LP, who was contracted through SCS, at the facility in March 2022 through April 2022. Cascade had a current and valid bond with the Water Wells Standards Advisory Council for the state of Georgia at the time of drilling (Appendix A). The driller's name is provided on the boring/construction diagrams presented in Appendix B.

An experienced Golder geologist was present on site to oversee and record the drilling and piezometer construction under the supervision of a professional geologist registered to practice in Georgia (Rachel Kirkman). Drilling methods employed for borehole advancement were rotasonic drilling techniques. The drilling equipment

consisted of a full-sized TSI 150T Truck-Mounted Sonic drilling rig, equipped with 4-inch sonic rods with a 6-inch outer-casing sleeve. During the drilling, continuous core samples were logged in the field for lithologic and geotechnical properties.

Prior to use, and between boreholes, downhole equipment was steam cleaned. The boring (lithologic) logs and piezometer construction records for the newly installed piezometers are included in Appendix B. The construction data are summarized on Table 1, and the locations of the piezometers are provided on Figure 1.

Piezometers were constructed within the borehole using factory-cleaned and sealed Schedule 40 polyvinyl chloride (PVC) products with flush-threaded fittings. Monitoring well DGWC-121 and piezometer B-122D were constructed with a 10-foot section of 4-inch outer diameter (OD) and 2-inch inner diameter (ID), flush-threaded, 0.010-inch factory-slotted PVC, U-Pack screen. To increase the likelihood of water production, piezometer B-123D was constructed with five (5) 10-foot sections of 4-inch outer diameter (OD) and 2-inch inner diameter (ID), flush-threaded, 0.010-inch factory-slotted PVC, U-Pack screens. The well depths for DGWC-121, B-122D, and B-123D are 50 feet, 85 feet, and 160 feet, respectively.

The drillers filled the annulus of each U-Pack screen section with No. 1 filter sand. For each borehole, the screen was placed near the bottom of the borehole, with the remainder of the piezometer constructed from 10-foot sections of 2-inch ID, flush-threaded, PVC casing riser. A flush-threaded PVC end cap was placed on the bottom of each piezometer to provide a 0.4-foot sump/sediment trap, and the top of the piezometers to extend to approximately 2.8 feet above grade. Construction details for the well and piezometers are shown on the boring/construction logs in Appendix B. The PVC products used were American Society for Testing and Materials (ASTM) and National Sanitation Foundation (NSF) rated.

Borehole geophysics was performed on piezometer B-123D to identify potential water-producing fractures to aid in well screen length and placement. Geophysical tests included acoustic televiewer, caliper, heat pulse flow meter, fluid temperature and fluid conductivity. The logs showed water producing features at 113 and 134 feet below ground surface (bgs). As these appeared to be relatively small fractures with low measurable flow (i.e., between 0.018 and 0.027 gallons per minute), the selected screened interval was chosen to target both potential water-bearing zones with a 50-foot screened interval. Borehole geophysical logs are included in Appendix C.

Following placement of the screen and casing, the annular space in each borehole adjacent to the screen was filled with US Standard Sieve size No. 1 filter pack sand as appropriate for the formation. The filter pack sand was placed into the borehole and extended approximately 2 to 3 feet above the depth of the top of the screen. Immediately following placement of the filter pack, each piezometer was pumped using a portable submersible pump until visibly clear water was discharged. A filter pack seal, composed of approximately 2.5 to 3 feet of hydrated 3/8" coated bentonite pellets, was then placed on top of the filter pack by slowly pouring the material down the borehole and tamping it into place. The bentonite was hydrated using potable water and allowed to cure for approximately two hours prior to grouting the piezometer.

Following hydration of the bentonite, the remaining annular space was grouted with an AquaGuard® bentonite grout mixture to approximately 2 feet below ground surface using a tremie method. Based on information provided by the product manufacturer, AquaGuard® is a bentonite grout consisting of bentonite and additives that allow for a mixture of 30% solids by weight to facilitate grouting via tremie pipe, with additives that slow the bentonite curing so that proper placement can be achieved. Each piezometer surface completion consists of a locked, anodized aluminum protective casing and a 4-foot by 4-foot by 4-inch concrete pad with an engraved tag

showing the piezometer name. The annular space of the aluminum protective casing was filled with pea gravel to approximately 2 inches from top of PVC. A weep hole was drilled into the lower side of the protective casing.

### **Piezometer Development Activities**

The newly installed piezometers were developed in April 2022 in general accordance with the *Monitoring Well Development Procedures* prepared by SCS (March 2016), and the US EPA Science and Ecosystem Support Division *Design and Installation of Monitoring Wells* (February 2008). The piezometers were surged using a Reclaimer pump system. During development, water quality measurements of pH, temperature, specific conductance, oxidation reduction potential (ORP), dissolved oxygen (DO), and turbidity were periodically collected using field-calibrated water quality equipment after the piezometer responded to improving conditions. Development activities were conducted utilizing an AquaTroll® multimeter and a Hach turbidimeter and for monitoring water quality measurements. Equipment calibration forms and development forms are included in Appendix B with development details summarized in Table 2.

During development, a turbidity value below 10 nephelometric turbidity units (NTUs) was achieved at each well and piezometer. Water level measurements were collected using a decontaminated electronic water level indicator, referenced to a permanent marking at the top of the casing and recorded to within 0.01 foot.

### **Piezometer Survey**

The newly installed piezometers and well were surveyed on May 9, 2022 by Metro Survey and Engineering. The survey was completed using Leica GS18T (survey-grade) global positioning system receiver and a closed level check loop with a Leica DNA 10 digital level with a positional tolerance of 0.5/0.01' H:V. The top of the PVC casing was surveyed to 0.5 foot horizontal and 0.01-foot vertical tolerance, and a marking was made on the PVC to use for reference during future measurements. Surveyed coordinates and elevations are presented on the boring/construction diagrams and on Table 1. The certified surveyor's report is attached as Appendix C.

### **Piezometer Abandonment**

Piezometer B-84 was damaged during construction activities for infrastructure updates and required abandonment in place by SCS's Civil Field Service Team. The abandonment was done under the oversight of Duane Fulton and under the supervision of a professional geologist registered to practice in Georgia (Rachel Kirkman) on April 28, 2022. The well was abandoned by backfilling the 2-inch PVC with time-released 3/8" TR-30 Pel-Plug bentonite pellets from 35 feet to 49.3 feet; and the remaining PVC was abandoned with 6.5 gallons of AquaGuard® bentonite grout mixture. There were no above-ground surface completions to remove.

### **Closing**

We appreciate the opportunity to assist SCS and Georgia Power with this project. Should you have any questions or require additional information, please contact the undersigned at (770) 496-1893.

Sincerely,

**Golder Associates USA Inc.**

# Cascade Drilling Bond

# Power of Attorney

KNOW ALL MEN BY THESE PRESENTS, that ATLANTIC SPECIALTY INSURANCE COMPANY, a New York corporation with its principal office in Plymouth, Minnesota, does hereby constitute and appoint: **Deanna M. French, Susan B. Larson, Elizabeth R. Hahn, Jana M. Roy, Scott McGilvray, Mindee L. Rankin, Ronald J. Lange, John R. Claeys, Roger Kaltenbach, Guy Armfield, Scott Fisher, Andrew P. Larsen, Nicholas Fredrickson, William M. Smith, Derek Sabo, Charla M. Boadle**, each individually if there be more than one named, its true and lawful Attorney-in-Fact, to make, execute, seal and deliver, for and on its behalf as surety, any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof; provided that no bond or undertaking executed under this authority shall exceed in amount the sum of: **unlimited** and the execution of such bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof in pursuance of these presents, shall be as binding upon said Company as if they had been fully signed by an authorized officer of the Company and sealed with the Company seal. This Power of Attorney is made and executed by authority of the following resolutions adopted by the Board of Directors of ATLANTIC SPECIALTY INSURANCE COMPANY on the twenty-fifth day of September, 2012:

Resolved: That the President, any Senior Vice President or Vice-President (each an "Authorized Officer") may execute for and in behalf of the Company any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof, and affix the seal of the Company thereto; and that the Authorized Officer may appoint and authorize an Attorney-in-Fact to execute on behalf of the Company any and all such instruments and to affix the Company seal thereto; and that the Authorized Officer may at any time remove any such Attorney-in-Fact and revoke all power and authority given to any such Attorney-in-Fact.

Resolved: That the Attorney-in-Fact may be given full power and authority to execute for and in the name and on behalf of the Company any and all bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof, and any such instrument executed by any such Attorney-in-Fact shall be as binding upon the Company as if signed and sealed by an Authorized Officer and, further, the Attorney-in-Fact is hereby authorized to verify any affidavit required to be attached to bonds, recognizances, contracts of indemnity, and all other writings obligatory in the nature thereof.

This power of attorney is signed and sealed by facsimile under the authority of the following Resolution adopted by the Board of Directors of ATLANTIC SPECIALTY INSURANCE COMPANY on the twenty-fifth day of September, 2012:

Resolved: That the signature of an Authorized Officer, the signature of the Secretary or the Assistant Secretary, and the Company seal may be affixed by facsimile to any power of attorney or to any certificate relating thereto appointing an Attorney-in-Fact for purposes only of executing and sealing any bond, undertaking, recognizance or other written obligation in the nature thereof, and any such signature and seal where so used, being hereby adopted by the Company as the original signature of such officer and the original seal of the Company, to be valid and binding upon the Company with the same force and effect as though manually affixed.

IN WITNESS WHEREOF, ATLANTIC SPECIALTY INSURANCE COMPANY has caused these presents to be signed by an Authorized Officer and the seal of the Company to be affixed this twenty-seventh day of April, 2020.

By   
Paul J. Brehm, Senior Vice President

STATE OF MINNESOTA  
HENNEPIN COUNTY

On this twenty-seventh day of April, 2020, before me personally came Paul J. Brehm, Senior Vice President of ATLANTIC SPECIALTY INSURANCE COMPANY, to me personally known to be the individual and officer described in and who executed the preceding instrument, and he acknowledged the execution of the same, and being by me duly sworn, that he is the said officer of the Company aforesaid, and that the seal affixed to the preceding instrument is the seal of said Company and that the said seal and the signature as such officer was duly affixed and subscribed to the said instrument by the authority and at the direction of the Company.

  
Notary Public

I, the undersigned, Secretary of ATLANTIC SPECIALTY INSURANCE COMPANY, a New York Corporation, do hereby certify that the foregoing power of attorney is in full force and has not been revoked, and the resolutions set forth above are now in force.

Signed and sealed. Dated 12 day of April, 2021.

This Power of Attorney expires  
January 31, 2025

This Power of Attorney is made and executed pursuant to and by authority of the following By-law and Authorizations of American States Insurance Company, First National Insurance Company of America, General Insurance Company of America, and Safeco Insurance Company of America, which are now in full force and effect reading as follows:

ARTICLE IV - OFFICERS: Section 12. Power of Attorney.

Any officer or other official of the Corporation authorized for that purpose in writing by the Chairman or the President, and subject to such limitation as the Chairman or the President may prescribe, shall appoint such attorneys-in-fact, as may be necessary to act in behalf of the Corporation to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations. Such attorney-in-fact, subject to the limitations set forth in their respective powers of attorney, shall have full power to bind the Corporation by their signature and executed, such instruments shall be as binding as if signed by the President and attested to by the Secretary. Any power or authority granted to any representative or attorney-in-fact under the provisions of this article may be revoked at any time by the Board, the Chairman, the President or by the officer or officers granting such power or authority.

Certificate of Designation - The President of the Company, acting pursuant to the Bylaws of the Company, authorizes David M. Carey, Assistant Secretary to appoint such attorneys-in-fact as may be necessary to act on behalf of the Company to make, execute, seal, acknowledge and deliver as surety any and all undertakings, bonds, recognizances and other surety obligations.

Authorization - By unanimous consent of the Company's Board of Directors, the Company consents that facsimile or mechanically reproduced signature of any assistant secretary of the Company, wherever appearing upon a certified copy of any power of attorney issued by the Company in connection with surety bonds, shall be valid and binding upon the Company with the same force and effect as though manually affixed.

I, Renee C. Llewellyn, the undersigned, Assistant Secretary, of American States Insurance Company, First National Insurance Company of America, General Insurance Company of America, and Safeco Insurance Company of America do hereby certify that the original power of attorney of which the foregoing is a full, true and correct copy of the Power of Attorney executed by said Companies, is in full force and effect and has not been revoked.

IN TESTIMONY WHEREOF, I have hereunto set my hand and affixed the seals of said Companies this 6th day of May, 2021.

# PURGING AND SAMPLING FORM

Project #: 166849621	Project Name/Site Name: <i>Plant McDonough</i>		Page: <u>1</u> of <u>2</u>
Well ID: 8-1230	Date: 4/11/22	Water Level (ft): 68.5	Time (WL): 1500
Well Diameter (in): 2	Well Depth (ft): 162.86	Water Column (ft): 94.36	Well Volume (gal): 15.38
Start Purge: 1500	End Purge: 1620	Top of Pump (ft): 133	3 Well Volume (gal): 46.14
Evacuation Method: Low-flow		Volume Removed (gal): 6.35	
Evacuation Equipment: <del>Geotech Dedicated</del> Pump <i>Reclaimer</i>		Purging Personnel: <i>C. Mikilins</i>	
Field probe: <del>Hydro Probe</del> <i>Aquatrak</i>	Serial #: 883561	Weather: 50° <i>Cloudy</i>	

## Purge Data/Field Parameters

Time	Color & Appearance	Odor	pH (S.U.)	Cond. (uS/cm)	DO (mg/L)	Temp (C)	ORP (mV)	Turbidity (NTU)	DTW (ft BGS)
1500								—	68.5
1505								—	—
1510								12.29	73.4
1515								11.7	73.2
1520								9.47	72.38
1525								9.38	71.51
1530								9.73	71.24
1535								11.36	70.68
1540								9.92	70.05
1545								9.04	69.28
1550								7.20	68.90
1555								6.57	68.35
1600								6.19	68.05
1605								5.76	67.70
1610								4.75	67.34
1615								4.94	67.20
1620								4.56	67.01

Stabilization Criteria (EPA Region 4 Groundwater sampling stabilization criteria, SESDPROC-301-R3, 2013):  
 pH ± 0.1 S.U., Conductivity ± 5%, Dissolved Oxygen ± 10% or ± 0.2 mg/L (whichever is greater), Turbidity value should be less than 10 NTU, preferably less than 5 NTU.

<b>Drilled Depth:</b> 140 ft bgs	<b>Casing Material:</b> Steel	<b>Water Level:</b> 22.49 ft bgs @ 7:47am	
<b>Drill Date:</b> March 29, 2022	<b>Casing Depth:</b> 92.5 ft bgs	<b>Borehole Incl.:</b> vertical	<b>Log Date:</b> March 30, 2022
<b>Drill Method.:</b> 6" sonic	<b>Casing Stick-up:</b> 1.75 ft ags	<b>Borehole Az.:</b> na	<b>Logged By:</b> Chris Bryant

**Notes:** B-123 was drilled from 110 to 140 ft after completion of the geophysical logging on 3-29-2022. All tools were zeroed with the probe top at the TOC and corrected to ground surface in processing. The accuracy of the orientation sensor (APS544) used in the QL40ABI-2G (ABI) acoustic televiewer is +/- 1.2 degrees for Azimuth and +/- 0.5 degrees for Tilt. The ABI images are oriented to magnetic north. Water level at the start of the static HPFM run was 23.21 ft bgs at 9:38 am, a drop of ~0.72 ft in ~2 hours, a falling head condition during the test.

## SURVEYOR'S REPORT

### SCOPE OF WORK:

Field survey of existing monitoring wells at Georgia Power Company, Plant Branch in Milledgeville, GA.

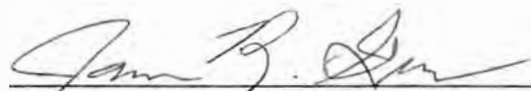

Horizontal and vertical datum was derived from RTK GPS observations with corrections received via a cellular modem utilizing the Leica "Smartnet" RTK Network and conventional surveying equipment. Horizontal datum is Georgia State Plane, West Zone, NAD83(2011) and vertical datum is NAVD88.

### EQUIPMENT USED TO ESTABLISH THE MONITORING WELL LOCATIONS:

Leica GS18T GPS Receiver  
Leica TS16 Total Station  
Leica DNA10 Digital Level

### CERTIFICATION:

I hereby certify that the center of well casing (PVC) has a horizontal accuracy of 0.5+/- feet or better using a Leica GS18T GPS (survey-grade) global positioning system receiver referencing the Georgia State Plane, West Zone, NAD83(2011) coordinate system in US survey feet. The top of well casing (PVC) elevation data was determined in feet above mean sea level based on the NAVD88 vertical datum. Vertical data was confirmed to be accurate within 0.01 foot through establishment of a closed level check loop with a Leica DNA10 digital level having a published accuracy of 0.9mm per dual-traverse kilometer.

# Well Maintenance and Repair Memorandum and Well Condition Inspection Forms

**APPENDIX D**

**Well Maintenance Repair  
Memorandum**

## TECHNICAL MEMORANDUM

**DATE** February 9, 2022

**TO** Joju Abraham, PG  
Southern Company Services

**CC** Ben Hodges, Georgia Power Company

**FROM** Golder Associates USA Inc.

**PLANT MCDONOUGH ASH POND 1, ASH POND 2 AND ASH POND 3/4**  
**WELL MAINTENANCE AND REPAIR DOCUMENTATION**  
**GEORGIA POWER COMPANY**

Golder Associates USA Inc. (Golder) has prepared this memorandum to provide documentation of groundwater monitoring well maintenance and/or repair performed at Plant McDonough Ash Pond 1, Ash Pond 2, and Ash Pond 3/4 during the semi-annual reporting period. Repairs and maintenance were completed in accordance with 12-5-134 (5)(D)vii of the Georgia Well Standards Act (1985) for routine visual inspections of groundwater monitoring wells (i.e., at least once every five years) under the direction of a Georgia licensed professional engineer or geologist.

**Plant McDonough – Well Maintenance Summary**

Well ID	Date Performed	Maintenance/Repair Performed
DGWA-53	October 2021	Cleared vegetation to improve access and visibility
DGWA-71	October 2021	Cleared vegetation to improve access and visibility. Replaced protective cover lid.
DGWC-2	October 2021	Replaced protective bollard.
DGWC-4	October 2021	Cleared vegetation to improve access and visibility
DGWC-5	October 2021	Cleared vegetation to improve access and visibility
DGWC-22	October 2021	Straighten protective bollard and added concrete to base.
DGWC-30	October 2021	Cleared vegetation to improve access and visibility
B-62	October 2021	Filled annular space with Portland/bentonite grout to approximately 5" from top of casing. Added pea gravel on top of grout.
B-63	October 2021	Repaired surface cracks in concrete pad with concrete resurface/fill
B-65	October 2021	Added concrete strap over the manhole cover for security.

Well ID	Date Performed	Maintenance/Repair Performed
B-87	October 2021	Cleared vegetation to improve access and visibility
B-88	October 2021	Cleared vegetation to improve access and visibility
B-94	October 2021	Cleared vegetation to improve access and visibility
B-95	October 2021	Replace concrete apron around flush mount protective cover. Updated survey is pending.
B-111	October 2021	Cleared vegetation to improve access and visibility
B-117D	October 2021	Cleared vegetation to improve access and visibility
B-3	October 2021	Cleared vegetation to improve access and visibility
B-120D	October 2021	Cleared vegetation to improve access and visibility
B-5	October 2021	Cleared vegetation to improve access and visibility
B-59	October 2021	Cleared vegetation to improve access and visibility; Straighten protective bollard.
DGWC-37	October 2021	Straighten protective bollard.
All wells	October 2021	Well Signs were confirmed and/or installed at all locations except for B-110D, B-112D and B-113D. These locations are flush mount wells located at the toe of AP1 dike. Signs will be replaced post construction.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP1 – DGWA-53:           Cleared overgrowth from around pad.

AP1 – DGWA-71:           Cleared overgrowth from around pad. Removed cracked protective cover lid and replaced with a new lid.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-2/3/4 – DGWC-2: Replaced front left bollard.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-2/3/4 – DGWC-4: Cleared overgrowth from around pad.

AP-2/3/4 – DGWC-5: Cleared overgrowth from around pad.

## Southern Company CFS Plant McDonough Oct 2021 Well O&M

AP-2/3/4 – DGWC-22: Straightened bollard and added additional concrete to base.

AP1 – DGWC-39: Cleared overgrowth from around pad.

## Southern Company CFS Plant McDonough Oct 2021 Well O&M

AP-4 2/3/- B-62: Filled annular with Portland/Bentonite Grout and brought up to approx. 5" from top of casing. Added pea gravel to top of grout.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-2/3/4 – B-63: Only surface cracks observed in pad. Used concrete resurface/fill to fill in superficial cracks.

AP4 – B-65: Bolt flange on inside of manhole broke due to concrete truck traffic at the Argos Batch Plant near AP4 fence. The only way to repair is to saw cut the manhole/pad out of concrete and replace. After discussing with ES&EE, decided to place a strap over top of the manhole cover to keep it in place. If truck traffic damages the strap, then full replacement may be required.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-4 2/3/- B-68: Discharge pipe is coming from the Argos Concrete Batch Plant Washdown area. The pipe is owned by Argos. After discussing with ES&EE, CFS did not tamper with the pipe until GPC EA/ES&EE contact Argos about extending the pipe downgradient of B-68.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-4 2/3/- B-87:      Cleared overgrowth from around pad.

AP-4 2/3/- B-88:      Cleared overgrowth from around pad.

## Southern Company CFS Plant McDonough Oct 2021 Well O&M

AP-4 2/3/- B-94:       Cleared overgrowth from around pad.

AP-4 2/3/- B-95:       Cracked pad due to truck traffic from Waste Management Facility. Appears that the manhole cover was pushed down which crushed the pad. The cover also contacted well cap and broke it. CFS removed the old pad/manhole and replaced. To lower the manhole closer to curb height to try to prevent the cover from being pushed down, CFS trimmed approx. 1' from the bottom of the manhole skirt. CFS also cut off the riser approx. 2" and replaced the well cap. The pad size was also increased, and rebar embedded in the concrete to strengthen and try to prevent the pad from cracking if it is run over again. Since CFS replaced the well cap, Golder will need to install a new cap lock as CFS was not able to transfer the lock over to the new cap. The well should also be resurveyed since the riser was cut off.

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

AP-4 2/3/- B-111D: Cleared overgrowth from around pad.

## Southern Company CFS Plant McDonough Oct 2021 Well O&M

AP-4 2/3/- B-117D: Cleared overgrowth from around pad.

Additionally, all well signs that CFS was requested to procure, were installed during this O&M mobilization. All well signs were installed with the exception of B-110D, B-112D and B-113D. These are flush mount wells located at the toe of AP1 Dike. The ordered signs for these 3 wells were left in the SCS construction trailer, with the construction coordinator at the request of ES&EE.

## Southern Company CFS Plant McDonough Oct 2021 Well O&M

While installing wells signs, additional wells that were observed needing maintenance where addressed:

B-3 – Clear overgrowth

B-120D – Clear Overgrowth

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

B-5 – Clear Overgrowth

B-59 – Straighten bollard and clear overgrowth

**Southern Company CFS**  
**Plant McDonough Oct 2021 Well O&M**

DGWC-37 – Straighten bollard

**APPENDIX D**

**Well Condition Assessment Forms  
September 2021**

**WELL INSPECTION FORM  
PLANT MCDONOUGH**

Well-ID	POSITION  ↑ or ↓	LOCATION / IDENTIFICATION	PROTECTIVE CASING	SURFACE PAD	INTERNAL CASING	SAMPLING (Groundwater Wells Only)
		a. Visible and accessible b. Properly identified with correct ID c. Not in a high traffic area that requires traffic protection d. No standing water nearby, adequate surrounding drainage	a. Free from damage, degradation, or deterioration b. Functioning weep hole c. Annular space free of debris and water, and has enough pea gravel d. Functioning lock and in good condition	a. Pad & bollards in good condition b. Sloped away from the well c. In contact with protective casing d. Stable and in contact with ground surface e. Free of debris f. Survey pin clearly identified	a. Cap prevents entry of foreign material b. Free of kinks or bends or any obstruction from foreign objects c. Weephole present and cap not too tight to allow equilibrium for air pressure d. Survey point clearly marked on the inner casing e. Sounded depth consistent with well log f. Stable/immobile	a. Well recharges adequately when purged b. If dedicated sampling equipment installed, it is in good condition and specified in the approved groundwater plan for the facility c. Does not require redevelopment

**Well Condition Assessment Forms  
January 2022**

# Groundwater Monitoring Well Integrity Form

Site Name: Plant McDonough

Permit Number:

Well ID: DGWA-53

Date: 1/18/22

Yes	No	N/A
-----	----	-----

1) Location/Identification

- |          |  |   |   |
|----------|--|---|---|
| <b>A</b> | Is the well visible and accessible?  | X |   |
| <b>B</b> | Is the well properly identified with correct well ID?  | X |   |
| <b>C</b> | Is the well in a high traffic area and does the well require protection from traffic?                              |   | X |
| <b>D</b> | Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | X |   |

2) Protective Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the protective casing free from apparent damage and able to be secured?                          | X |  |
| <b>B</b> | Is the casing free of degradation or deterioration?   | X |  |
| <b>C</b> | Does the casing have a functioning weep hole?   | X |  |
| <b>D</b> | Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |
| <b>E</b> | Is the well locked and is the lock in good condition?   | X |  |

3) Surface Pad

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the well pad in good condition (not cracked/broken)?                 | X |  |
| <b>B</b> | Is the well pad sloped away from the protective casing?                 | X |  |
| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

5) Sampling: Groundwater Wells Only

- |          |  |   |   |
|----------|--|---|---|
| <b>A</b> | Does water recharge adequately when purged?  | X |   |
| <b>B</b> | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater monitoring plan for the facility? | X |   |
| <b>C</b> | Does the well require redevelopment (low flow/turbidity)?  |   | X |

6) Based on professional judgement, is the well construction / location appropriate to **1)** achieve the objectives of the Groundwater Monitoring Program and **2)** comply with the applicable regulatory requirements? X

7) Corrective actions as needed, by date:

| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

5) Sampling: Groundwater Wells Only

- |          |  |   |  |
|----------|--|---|--|
| <b>A</b> | Does water recharge adequately when purged?  | X |  |
| <b>B</b> | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater monitoring plan for the facility? | X |  |
| <b>C</b> | Does the well require redevelopment (low flow/turbidity)?  | X |  |

6) Based on professional judgement, is the well construction / location appropriate to **1)** achieve the objectives of the Groundwater Monitoring Program and **2)** comply with the applicable regulatory requirements? X

7) Corrective actions as needed, by date:

| <b>A</b> | Is the protective casing free from apparent damage and able to be secured?                          | X |  |
| <b>B</b> | Is the casing free of degradation or deterioration?   | X |  |
| <b>C</b> | Does the casing have a functioning weep hole?   | X |  |
| <b>D</b> | Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |
| <b>E</b> | Is the well locked and is the lock in good condition?   | X |  |

3) Surface Pad

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the well pad in good condition (not cracked/broken)?                 | X |  |
| <b>B</b> | Is the well pad sloped away from the protective casing?                 | X |  |
| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

5) Sampling: Groundwater Wells Only

- |          |  |   |   |
|----------|--|---|---|
| <b>A</b> | Does water recharge adequately when purged?  | X |   |
| <b>B</b> | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater monitoring plan for the facility? | X |   |
| <b>C</b> | Does the well require redevelopment (low flow/turbidity)?  |   | X |

6) Based on professional judgement, is the well construction / location appropriate to **1)** achieve the objectives of the Groundwater Monitoring Program and **2)** comply with the applicable regulatory requirements? X

7) Corrective actions as needed, by date:

- |          |  |   |   |
|----------|--|---|---|
| <b>A</b> | Is the well visible and accessible?  | X |   |
| <b>B</b> | Is the well properly identified with correct well ID?  | X |   |
| <b>C</b> | Is the well in a high traffic area and does the well require protection from traffic?                              |   | X |
| <b>D</b> | Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | X |   |

2) Protective Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the protective casing free from apparent damage and able to be secured?                          | X |  |
| <b>B</b> | Is the casing free of degradation or deterioration?   | X |  |
| <b>C</b> | Does the casing have a functioning weep hole?   | X |  |
| <b>D</b> | Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |
| <b>E</b> | Is the well locked and is the lock in good condition?   | X |  |

3) Surface Pad

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the well pad in good condition (not cracked/broken)?                 | X |  |
| <b>B</b> | Is the well pad sloped away from the protective casing?                 | X |  |
| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

5) Sampling: Groundwater Wells Only

- |          |  |   |  |
|----------|--|---|--|
| <b>A</b> | Does water recharge adequately when purged?  | X |  |
| <b>B</b> | If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater monitoring plan for the facility? | X |  |
| <b>C</b> | Does the well require redevelopment (low flow/turbidity)?  | X |  |

6) Based on professional judgement, is the well construction / location appropriate to **1)** achieve the objectives of the Groundwater Monitoring Program and **2)** comply with the applicable regulatory requirements? X

7) Corrective actions as needed, by date:

Date: 1/18/22

	Yes	No	N/A
--	-----	----	-----

1) Location/Identification

- |  |   |   |  |
|--|---|---|--|
| A Is the well visible and accessible?  | X |   |  |
| B Is the well properly identified with correct well ID?  | X |   |  |
| C Is the well in a high traffic area and does the well require protection from traffic?                              |   | X |  |
| D Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | X |   |  |

2) Protective Casing

- |   |   |  |  |
|---|---|--|--|
| A Is the protective casing free from apparent damage and able to be secured?                          | X |  |  |
| B Is the casing free of degradation or deterioration?   | X |  |  |
| C Does the casing have a functioning weep hole?   | X |  |  |
| D Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |  |
| E Is the well locked and is the lock in good condition?   | X |  |  |

3) Surface Pad

- |   |   |  |  |
|---|---|--|--|
| A Is the well pad in good condition (not cracked/broken)?                 | X |  |  |
| B Is the well pad sloped away from the protective casing?                 | X |  |  |
| C Is the well pad in complete contact with the ground surface and stable? | X |  |  |
| D Is the well pad in complete contact with the protective casing?         | X |  |  |
| E Is the pad surface clean (not covered with sediment or debris)?         | X |  |  |

4) Internal Casing

- |   |   |  |  |
|---|---|--|--|
| A Does the cap prevent entry of foreign material into the well?   | X |  |  |
| B Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |  |
| C Is the well properly vented for equilibration of air pressure?  | X |  |  |
| D Is the survey point clearly marked on the inner casing?   | X |  |  |
| E Is the depth of the well consistent with the original well log?   | X |  |  |
| F Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |  |

5) Sampling: Groundwater Wells Only

- |  |   |  |  |
|--|---|--|--|
| A Does water recharge adequately when purged? If dedicated sampling equipment installed, is it in good condition and specified in the approved groundwater monitoring plan for the facility? | X |  |  |
| B Does the well require redevelopment (low flow/turbidity)?  | X |  |  |
| C  | X |  |  |

6) Based on professional judgement, is the well construction / location appropriate to **1)** achieve the objectives of the Groundwater Monitoring Program and **2)** comply with the applicable regulatory requirements? X

-----	----	-----

1) Location/Identification

- |          |  |   |   |
|----------|--|---|---|
| <b>A</b> | Is the well visible and accessible?  | X |   |
| <b>B</b> | Is the well properly identified with correct well ID?  | X |   |
| <b>C</b> | Is the well in a high traffic area and does the well require protection from traffic?                              |   | X |
| <b>D</b> | Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | X |   |

2) Protective Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the protective casing free from apparent damage and able to be secured?                          | X |  |
| <b>B</b> | Is the casing free of degradation or deterioration?   | X |  |
| <b>C</b> | Does the casing have a functioning weep hole?   | X |  |
| <b>D</b> | Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |
| <b>E</b> | Is the well locked and is the lock in good condition?   | X |  |

3) Surface Pad

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the well pad in good condition (not cracked/broken)?                 | X |  |
| <b>B</b> | Is the well pad sloped away from the protective casing?                 | X |  |
| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

5) Sampling: Groundwater Wells Only

- |          |  |   |  |
|----------|--|---|--|
| <b>A</b> | Does water recharge adequately when purged?  | X |  |

-----	----	-----

1) Location/Identification

- |          |  |   |  |
|----------|--|---|--|
| <b>A</b> | Is the well visible and accessible?  | X |  |
| <b>B</b> | Is the well properly identified with correct well ID?  | X |  |
| <b>C</b> | Is the well in a high traffic area and does the well require protection from traffic?                              | X |  |
| <b>D</b> | Is the drainage around the well acceptable? (no standing water, nor is well located in obvious drainage flow path) | X |  |

2) Protective Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the protective casing free from apparent damage and able to be secured?                          | X |  |
| <b>B</b> | Is the casing free of degradation or deterioration?   | X |  |
| <b>C</b> | Does the casing have a functioning weep hole?   | X |  |
| <b>D</b> | Is the annular space between the casings clear of debris and water, or filled with pea gravel/sand? | X |  |
| <b>E</b> | Is the well locked and is the lock in good condition?   | X |  |

3) Surface Pad

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Is the well pad in good condition (not cracked/broken)?                 | X |  |
| <b>B</b> | Is the well pad sloped away from the protective casing?                 | X |  |
| <b>C</b> | Is the well pad in complete contact with the ground surface and stable? | X |  |
| <b>D</b> | Is the well pad in complete contact with the protective casing?         | X |  |
| <b>E</b> | Is the pad surface clean (not covered with sediment or debris)?         | X |  |

4) Internal Casing

- |          |   |   |  |
|----------|---|---|--|
| <b>A</b> | Does the cap prevent entry of foreign material into the well?   | X |  |
| <b>B</b> | Is the casing free of kinks/bends, or any obstructions from foreign objects (such as bailers)?  | X |  |
| <b>C</b> | Is the well properly vented for equilibration of air pressure?  | X |  |
| <b>D</b> | Is the survey point clearly marked on the inner casing?   | X |  |
| <b>E</b> | Is the depth of the well consistent with the original well log?   | X |  |
| <b>F</b> | Is the casing stable? (Does PVC move easily when touched or can be taken apart by hand due to lack of grout or use of slip couplings in construction) | X |  |

## GROUNDWATER STATS CONSULTING

February 28, 2022

Southern Company Services  
Attn: Mr. Joju Abraham  
241 Ralph McGill Blvd NE, Bin 10160  
Atlanta, Georgia 30308-3374

Re: Plant McDonough Ash Pond (AP-2,3,4)  
September 2021 Statistical Analysis

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the September 2021 Semi-Annual Groundwater Monitoring and Corrective Action Statistical summary of groundwater data for Georgia Power Company's Plant McDonough AP-2,3,4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling for Appendix III parameters began in 2016, and at least 8 background samples were collected at each of the groundwater monitoring wells. Semi-annual sampling of the majority of Appendix IV constituents has been performed for several years in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations. A list of all parameters is provided below.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** DGWA-53, DGWA-70A, DGWA-71
- **Downgradient wells:** DGWC-2, DGWC-4, DGWC-5, DGWC-8, DGWC-9, DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-14, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-42, DGWC-47, and DGWC-48

- **Delineation wells:** B-56, B-62, B-63, B-66, B-77, B-82, B-83, B-88, B-92, B-93, B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, B-111D, B-115D, and B-120D

The delineation wells were installed at various times during 2016-2020 as follows:

- **2016** - B-56, B-62, B-63, and B-66
- **2019** - B-77, B-82, B-83, B-88, B-92, and B-93
- **2020** – B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, and B-111D
- **2021** – B-115D and B-120D

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Founder and Groundwater Statistician of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The Coal Combustion Residuals (CCR) program consists of the constituents listed below. The terms “parameters” and “constituents” are used interchangeably.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient and delineation well/constituent pairs containing 100% non-detects follows this letter.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the previous screening and demonstrated that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

### **Summary of Statistical Methods – Appendix III Parameters**

Based on the earlier evaluation described above, the following methods were selected:

- Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, pH, sulfate, and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In some cases, earlier data are deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

## **Summary of Background Screening – Conducted in March 2019**

### Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. In cases where the most recent value was identified as an outlier, values were not flagged in the database as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e. measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Of the outliers identified by Tukey's method, only a few of these values were flagged in the database as all other values are similar to other measurements.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

## Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

## Trend Test Evaluation

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses were included with the previous screening and showed two statistically significant decreasing trends for the Appendix III parameters. The only trend identified in the upgradient wells was a statistically significant decreasing trend for sulfate in well DGWA-71. All trends noted were relatively low in magnitude when compared to average concentrations; therefore, no adjustments were made to the data sets.

## Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified no variation among upgradient well data for fluoride, making this constituent eligible for interwell analyses. Variation was noted for boron, calcium, chloride, pH, sulfate, and TDS, which would indicate intrawell analyses may be most appropriate for these parameters. While data were further tested for intrawell eligibility during the screening, interwell methods will be used for all Appendix III constituents in accordance with Georgia EPD requirements.

## **Statistical Analysis of Appendix III Parameters – September 2021**

### Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through September 2021 (Figure D). Background (upgradient) well data were re-assessed for potential outliers during this analysis and no new values were flagged. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The September 2021 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result. Therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Several prediction limit exceedances were noted for Appendix III parameters. A summary table of the interwell prediction limits follows this letter.

### Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure E). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells. Similar patterns that are present in both upgradient and downgradient wells are an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of the trend test results follows this letter. Statistically significant trends were noted for the following well/constituent pairs:

#### Increasing trends

- Boron: DGWC-4 and DGWC-11
- Calcium: DGWC-4, DGWC-5, DGWC-11, and DGWC-19
- Chloride: DGWC-11, DGWC-15, and DGWC-20
- pH: DGCW-5 and DGWC-19
- Sulfate: DGWC-19
- TDS: DGWC-5, DGWC-11, and DGWC-19

#### Decreasing trends

- Boron: DGWC-2, DGWC-8, DGWC-9, DGWC-10, DGWC-12, DGWC-13, DGWC-20, DGWC-47, and DGWC-48
- Calcium: DGWC-2, DGWC-48, and DGWA-53 (upgradient)
- Chloride: DGWC-4, DGWC-12, DGWC-19, DGWC-21, DGWC-22, DGWC-23, DGWC-42, DGWC-48, and DGWA-53 (upgradient)
- Fluoride: DGWC-48
- pH: DGWC-9
- Sulfate: DGWC-2, DGWC-8, DGWC-12, DGWC-15, DGWC-20, DGWC-47, DGWC-48, DGWA-70A (upgradient), and DGWA-71 (upgradient)
- TDS: DGWC-8, DGWC-20, DGWC-48, and DGWA-53 (upgradient)

### **Statistical Analysis of Appendix IV Parameters – September 2021**

For Appendix IV parameters, confidence intervals for each downgradient and delineation well/constituent pair with four or more samples were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. As mentioned above, downgradient and delineation well/constituent pairs that contain 100% non-detects do not require analysis. Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis prior to constructing statistical limits. No new values were flagged during this analysis and a complete list of flagged outliers follows this report (Figure C).

#### Interwell Upper Tolerance Limits

Interwell upper tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through September 2021 for Appendix IV constituents (Figure F). Parametric tolerance limits are used when data follow a normal or transformed-normal distribution such as for combined radium. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used. Note that in order to maintain conservative limits from a regulatory perspective, non-parametric tolerance limits were used for cobalt.

## Groundwater Protection Standards

The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a).

As described in 40 CFR §257.95(h) (1-3), the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title
- Where an MCL has not been established for a constituent, CCR-rule specified levels have been specified for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

On July 30, 2018, USEPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Georgia EPD has not incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a); therefore, for sites regulated under Georgia EPD Rules, the GWPS is:

- The MCL or
- The background concentration when an MCL is not established or when the background concentration is higher than the MCL.

Following the above Georgia EPD Rule requirements, GWPS were established for statistical comparison of Appendix IV constituents for the September 2021 sample event for the Federal and State rules (Figures G and H, respectively).

## Confidence Intervals

To complete the statistical comparison to GWPS, confidence intervals were constructed for the Appendix IV constituents in accordance with the federal and state requirements in each downgradient well (Figures I and J, respectively). Note that confidence intervals require a minimum of 4 samples and, in many cases, the delineation wells had insufficient samples at this time. The Sanitas software was used to calculate the tolerance limits and the confidence intervals. Due to the required transformations to fit the data to a transformed normal distribution, the lower confidence limits resulted in negative numbers for some well/constituent pairs. Therefore, non-parametric confidence intervals, which are bound by reported high and low measurements within a given well, were constructed for these particular cases and may be found at the end of Figures I and J. A summary of the

confidence intervals follows this letter. Exceedances were noted for the following well/constituent pairs:

Federal:

- Arsenic: DGWC-9
- Beryllium: DGWC-5, DGWC-9, DGWC-10, DGWC-47, DGWC-48, and B-93
- Cobalt: DGWC-8, DGWC-9, DGWC-10, DGWC-19, DGWC-20, DGWC-47, DGWC-48, B-56, B-63, and B-93
- Combined Radium 226 + 228: B-104D
- Lithium: DGWC-47 and DGWC-48
- Selenium: DGWC-9

State:

- Arsenic: DGWC-9
- Beryllium: DGWC-5, DGWC-9, DGWC-10, DGWC-47, DGWC-48, and B-93
- Cobalt: DGWC-8, DGWC-9, DGWC-10, DGWC-19, DGWC-20, DGWC-47, DGWC-48, B-56, B-63, and B-93
- Combined Radium 226 + 228: B-104D
- Lithium: DGWC-47, DGWC-48, and B-104D
- Selenium: DGWC-9

Trend Test Evaluation – Appendix IV

Data at wells with confidence interval exceedances are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure K). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. When trends are present in upgradient trends, it is an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of the Appendix IV trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Cobalt: DGWC-9

Decreasing

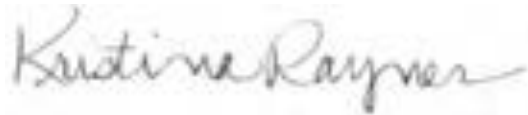

- Beryllium: DGWA-70A (upgradient) and DGWC-47
- Cobalt: DGWA-53 (upgradient), DGWC-8, DGWC-9, DGWC-10, DGWC-47, and DGWC-48
- Lithium: DGWC-47 and DGWC-48

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for McDonough AP-2,3,4. If you have any questions or comments, please feel free to contact us.

Constituent: pH, Field Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Selenium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Selenium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Selenium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Selenium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Sulfate as SO4 Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Thallium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Thallium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Thallium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Thallium Analysis Run 11/8/2021 1:09 PM View: AP 234  
 Plant McDonough Client: Southern Company Data: McDonough AP

Box & Whiskers Plot

Constituent: Total Dissolved Solids [TDS] Analysis Run 11/8/2021 1:09 PM View: AP 234

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-15, DGWC-17, DGWC-19, DGWC-2, DGWC-20, DGWC-21...

Prediction Limit  
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 41 background values. 26.83% NDs. Annual per-constituent alpha = 0.04021. Individual comparison alpha = 0.001025 (1 of 2). Comparing 20 points to limit.

Constituent: Boron, total Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-19, DGWC-2, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-4, DGWC-48...

Prediction Limit  
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 41 background values. 4.878% NDs. Annual per-constituent alpha = 0.04021. Individual comparison alpha = 0.001025 (1 of 2). Comparing 20 points to limit.

Constituent: Calcium, total Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22...

Prediction Limit  
Interwell Parametric

Background Data Summary (based on natural log transformation): Mean=0.9633, Std. Dev.=0.2952, n=43. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9421, critical = 0.923. Kappa = 2.236 (c=7, w=20, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0003762. Comparing 20 points to limit.

Constituent: Chloride, Total Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-48, DGWC-9

Prediction Limit  
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 48 background values. 52.08% NDs. Annual per-constituent alpha = 0.03068. Individual comparison alpha = 0.0007788 (1 of 2). Comparing 20 points to limit.

Constituent: Fluoride, total Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-17, DGWC-19, DGWC-20, DGWC-42, DGWC-47, DGWC-48, DGWC-5, DGWC-8, DGWC-9

Prediction Limit  
Interwell Parametric

Background Data Summary: Mean=5.9, Std. Dev.=0.3378, n=50. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.9448, critical = 0.935. Kappa = 2.208 (c=7, w=20, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0001881. Comparing 20 points to limit.

Constituent: pH, Field Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-14, DGWC-15, DGWC-17, DGWC-19, DGWC-2, DGWC-20...

Prediction Limit  
Interwell Parametric

Background Data Summary (based on square root transformation): Mean=2.563, Std. Dev.=1.435, n=43, 11.63% NDs. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9331, critical = 0.923. Kappa = 2.236 (c=7, w=20, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0003762. Comparing 20 points to limit.

Constituent: Sulfate as SO4 Analysis Run 11/8/2021 1:14 PM View: AP 234 Appendix III  
Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-4, DGWC-42...

Prediction Limit  
Interwell Parametric

Background Data Summary (based on cube root transformation): Mean=4.572, Std. Dev.=0.9447, n=42. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.933, critical = 0.922. Kappa = 2.24 (c=7, w=20, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0003762. Comparing 20 points to limit.

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lead Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lead Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lithium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Mercury Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Mercury Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Mercury Analysis Run 11/8/2021 2:40 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted.

Constituent: Mercury Analysis Run 11/8/2021 2:41 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Mercury Analysis Run 11/8/2021 2:41 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Molybdenum Analysis Run 11/8/2021 2:41 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Molybdenum Analysis Run 11/8/2021 2:41 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 11/8/2021 2:41 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 11/8/2021 2:21 PM View: AP 234 Confidence Intervals

## GROUNDWATER STATS CONSULTING

July 29, 2022

Southern Company Services  
Attn: Mr. Joju Abraham  
241 Ralph McGill Blvd NE, Bin 10160  
Atlanta, Georgia 30308-3374

Re: Plant McDonough Ash Pond (AP-2,3,4)  
January 2022 Statistical Analysis

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the January 2022 Semi-Annual Groundwater Monitoring and Corrective Action Statistical summary of groundwater data for Georgia Power Company's Plant McDonough AP-2,3,4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling for Appendix III parameters began in 2016, and at least 8 background samples were collected at each of the groundwater monitoring wells. Semi-annual sampling of the majority of Appendix IV constituents has been performed for several years in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations. A list of all parameters is provided below.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** DGWA-53, DGWA-70A, DGWA-71
- **Downgradient wells:** DGWC-2, DGWC-4, DGWC-5, DGWC-8, DGWC-9, DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-14, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-42, DGWC-47, and DGWC-48

- **Delineation wells:** B-56, B-62, B-63, B-66, B-77, B-82, B-83, B-88, B-92, B-93, B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, B-111D, B-115D, and B-120D

The delineation wells were installed at various times during 2016-2020 as follows:

- **2016** - B-56, B-62, B-63, and B-66
- **2019** - B-77, B-82, B-83, B-88, B-92, and B-93
- **2020** – B-97, B-98, B-100, B-101D, B-102D, B-104D, B-106D, B-107D, B-108D, B-109D, and B-111D
- **2021** – B-115D and B-120D

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Founder and Senior Statistician to Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The Coal Combustion Residuals (CCR) program consists of the constituents listed below. The terms “parameters” and “constituents” are used interchangeably.

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix IV downgradient and delineation well/constituent pairs containing 100% non-detects follows this letter.

Time series plots for Appendix III and IV parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the previous screening and demonstrated that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

### **Summary of Statistical Methods – Appendix III Parameters**

Based on the earlier evaluation described above, the following methods were selected:

- Interwell prediction limits, combined with a 1-of-2 resample plan for boron, calcium, chloride, fluoride, pH, sulfate, and TDS

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In some cases, earlier data may require deselection prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

## **Summary of Background Screening – Conducted in March 2019**

### Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits.

Using the Tukey box plot method, several outliers were identified. In cases where the most recent value was identified as an outlier, values were not flagged in the database as they may represent a possible trend. If future values do not remain at similar concentrations, these values will be flagged as outliers and deselected. Several low values exist in the data sets and appear on the graphs as possible low outliers relative to the laboratory's Practical Quantitation Limit. However, these values are observed trace values (i.e., measurements reported by the laboratory between the Method Detection Limit and the Practical Quantitation Limit) and, therefore, were not flagged as outliers.

Of the outliers identified by Tukey's method, only a few of these values were flagged in the database as all other values are similar to other measurements.

Additionally, when any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph. The accompanying data pages display the flagged value in a lighter font as well. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

## Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

## Trend Test Evaluation

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well to identify statistically significant increasing or decreasing trends. In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses were included with the previous screening and showed two statistically significant decreasing trends for the Appendix III parameters. The only trend identified in the upgradient wells was a statistically significant decreasing trend for sulfate in well DGWA-71. All trends noted were relatively low in magnitude when compared to average concentrations; therefore, no adjustments were made to the data sets.

## Appendix III – Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells are not representative of the current background data population; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter.

The ANOVA identified no variation among upgradient well data for fluoride, making this constituent eligible for interwell analyses. Variation was noted for boron, calcium, chloride, pH, sulfate, and TDS, which would indicate intrawell analyses may be most appropriate for these parameters. While data were further tested for intrawell eligibility during the screening, interwell methods will be used for all Appendix III constituents in accordance with Georgia EPD requirements.

## **Statistical Analysis of Appendix III Parameters – January 2022**

### Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical upgradient well data through January 2022 (Figure D). Background (upgradient) well data were re-assessed for potential outliers during this analysis and no new values were flagged. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The January 2022 sample from each downgradient well is compared to the background limit to determine whether initial exceedances are present.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When a resample confirms the initial exceedance, a statistically significant increase is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result. Therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Several prediction limit exceedances were noted for Appendix III parameters. A summary table of the interwell prediction limits follows this letter.

### Trend Test Evaluation – Appendix III

When prediction limit exceedances are identified in downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure E). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells. Similar patterns that are present in both upgradient and downgradient wells are an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of the trend test results follows this letter. Statistically significant trends were noted for the following well/constituent pairs:

#### Increasing trends

- Boron: DGWC-4 and DGWC-11
- Calcium: DGWC-4, DGWC-5, DGWC-11, and DGWC-19
- Chloride: DGWC-9, DGWC-15, and DGWC-20
- pH: DGWC-5 and DGWC-19
- Sulfate: DGWC-19
- TDS: DGWC-4, DGWC-5, DGWC-11, and DGWC-19

#### Decreasing trends

- Boron: DGWC-2, DGWC-8, DGWC-9, DGWC-10, DGWC-12, DGWC-20, DGWC-47, and DGWC-48
- Calcium: DGWC-2, DGWC-48, and DGWA-53 (upgradient)
- Chloride: DGWC-4, DGWC-12, DGWC-19, DGWC-21, DGWC-22, DGWC-23, DGWC-42, DGWC-48, and DGWA-53 (upgradient)
- Fluoride: DGWC-47 and DGWC-48
- pH: DGWC-9, DGWC-13, and DGWC-47
- Sulfate: DGWC-2, DGWC-8, DGWC-12, DGWC-15, DGWC-20, DGWC-21, DGWC-42, DGWC-47, DGWC-48, DGWA-70A (upgradient), and DGWA-71 (upgradient)
- TDS: DGWC-20, DGWC-48, and DGWA-53 (upgradient)

### **Statistical Analysis of Appendix IV Parameters – January 2022**

For Appendix IV parameters, confidence intervals for each downgradient and delineation well/constituent pair with four or more samples were compared against corresponding Groundwater Protection Standards (GWPS). GWPS were developed as described below. As mentioned above, downgradient and delineation well/constituent pairs that contain 100% non-detects do not require analysis. Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis prior to constructing statistical limits. No new values were flagged during this analysis and a complete list of flagged outliers follows this report (Figure C).

#### Interwell Upper Tolerance Limits

Interwell upper tolerance limits were used to calculate site-specific background limits from all available pooled upgradient well data through January 2022 for Appendix IV constituents (Figure F). Parametric tolerance limits are used when data follow a normal or transformed-normal distribution such as for combined radium. When data contained greater than 50% non-detects or did not follow a normal or transformed-normal distribution, non-parametric tolerance limits were used. Note that in order to maintain

conservative limits from a regulatory perspective, non-parametric tolerance limits were used for cobalt.

### Groundwater Protection Standards

The background limits were then used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and Georgia EPD Rule 391-3-4-.10(6)(a). On July 30, 2018, US EPA revised the Federal CCR rule updating GWPS for cobalt, lead, lithium, and molybdenum as described above in 40 CFR §257.95(h)(2). Effective on February 22, 2022, Georgia EPD incorporated the updated GWPS into the current Georgia EPD Rules for Solid Waste Management 391-3-4-.10(6)(a). In accordance with the updated Rules, the GWPS is:

- The maximum contaminant level (MCL) established under §141.62 and §141.66 of this title
- Where an MCL has not been established for a constituent, Federal and State CCR Rules specify levels for cobalt (0.006 mg/L), lead (0.015 mg/L), lithium (0.040 mg/L), and molybdenum (0.100 mg/L)
- The respective background level for a constituent when the background level is higher than the MCL or Federal CCR Rule identified GWPS

Following Georgia EPD Rule requirements and the Federal CCR requirements, GWPS were established for statistical comparison of Appendix IV constituents for this sample event (Figure G).

### Confidence Intervals

To complete the statistical comparison to GWPS, confidence intervals were constructed for each of the Appendix IV constituents in accordance with the state requirements in each downgradient well (Figure H). Note that confidence intervals require a minimum of 4 samples and, in many cases, the delineation wells had insufficient samples at this time. The Sanitas software was used to calculate the tolerance limits and the confidence intervals.

Due to the required transformations to fit the data to a transformed normal distribution, the lower confidence limits resulted in negative numbers for some well/constituent pairs. Therefore, non-parametric confidence intervals, which are bound by reported high and low measurements within a given well, were constructed for these particular cases and may be found at the end of Figure H. This is a more conservative approach in that the lower confidence limit reflects the lowest reported measurement in the data set rather than a negative number.

Confidence intervals were compared to the GWPS prepared as described above. Only when the entire confidence interval is above a GWPS is the downgradient well/constituent pair considered to exceed its respective standard. If there is an exceedance of the GWPS, a statistically significant level (SSL) exceedance is identified. A summary of the confidence intervals follows this letter. Exceedances were noted for the following well/constituent pairs:

- Arsenic: DGWC-9
- Beryllium: DGWC-5, DGWC-9, DGWC-10, DGWC-47, DGWC-48, B-92, and B-93
- Cobalt: DGWC-8, DGWC-9, DGWC-10, DGWC-19, DGWC-20, DGWC-47, DGWC-48, B-56, B-63, B-93, and B-104D
- Combined Radium 226 + 228: B-104D and B-109D
- Lithium: DGWC-47 and DGWC-48

#### Trend Test Evaluation – Appendix IV

Data at wells with confidence interval exceedances are further evaluated using the Sen's Slope/Mann Kendall trend test to determine whether concentrations are statistically increasing, decreasing, or stable (Figure I). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. When trends are present in upgradient trends, it is an indication of natural variability in groundwater quality unrelated to practices at the site. A summary of the Appendix IV trend test results follows this letter. Statistically significant trends were identified for the following well/constituent pairs:

#### Increasing

- Cobalt: DGWC-9

#### Decreasing

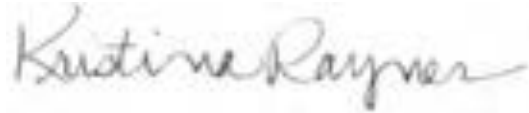

- Beryllium: DGWA-70A (upgradient) and DGWC-48
- Cobalt: DGWA-53 (upgradient), DGWC-8, DGWC-9, DGWC-10, DGWC-47, and DGWC-48
- Combined Radium 226 + 228: DGWA-53 (upgradient)
- Lithium: DGWC-47 and DGWC-48

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for McDonough AP-2,3,4. If you have any questions or comments, please feel free to contact us.

For Groundwater Stats Consulting,

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-15, DGWC-17, DGWC-19, DGWC-2, DGWC-20, DGWC-21...

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 44 background values. 25% NDs. Annual per-constituent alpha = 0.03613. Individual comparison alpha = 0.0009194 (1 of 2). Comparing 20 points to limit.

Constituent: Boron, total Analysis Run 3/14/2022 1:48 PM View: AP 234 Appendix III Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-13, DGWC-19, DGWC-2, DGWC-20, DGWC-21, DGWC-22, DGWC-23, DGWC-4...

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 44 background values. 4.545% NDs. Annual per-constituent alpha = 0.03613. Individual comparison alpha = 0.0009194 (1 of 2). Comparing 20 points to limit.

Constituent: Calcium, total Analysis Run 3/14/2022 1:48 PM View: AP 234 Appendix III Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-11, DGWC-12, DGWC-13, DGWC-15, DGWC-17, DGWC-19, DGWC-20, DGWC-21, DGWC-22...

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 46 background values. Annual per-constituent alpha = 0.0334. Individual comparison alpha = 0.000849 (1 of 2). Comparing 20 points to limit.

Constituent: Chloride, Total Analysis Run 3/14/2022 1:48 PM View: AP 234 Appendix III Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limit: DGWC-10, DGWC-20, DGWC-47, DGWC-48, DGWC-9

Prediction Limit Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 51 background values. 52.94% NDs. Annual per-constituent alpha = 0.02717. Individual comparison alpha = 0.0006883 (1 of 2). Comparing 20 points to limit.

Constituent: Fluoride, total Analysis Run 3/14/2022 1:48 PM View: AP 234 Appendix III Plant McDonough Client: Southern Company Data: McDonough AP

Exceeds Limits: DGWC-10, DGWC-13, DGWC-19, DGWC-20, DGWC-47, DGWC-48, DGWC-5, DGWC-9

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Antimony Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Antimony Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Antimony Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Arsenic Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Barium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Beryllium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cadmium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Chromium Analysis Run 4/13/2022 4:31 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Cobalt Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Combined Radium 226 + 228 Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Inte  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Fluoride, total Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Lead Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance limit is exceeded.\* Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded.

Constituent: Lithium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Mercury Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01.

Constituent: Mercury Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Mercury Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Non-Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted.

Constituent: Mercury Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
 Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Mercury Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Molybdenum Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Molybdenum Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric and Non-Parametric (NP) Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01 except as noted. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

### Parametric Confidence Interval

Compliance Limit is not exceeded. Per-well alpha = 0.01. Normality Test: Shapiro Wilk, alpha based on n.

Constituent: Selenium Analysis Run 4/13/2022 4:32 PM View: AP 234 Confidence Intervals  
Plant McDonough Client: Southern Company Data: McDonough AP

## Certification

This *Semi-Annual Remedy Selection and Design Progress Report, Georgia Power Company – Plant McDonough-Atkinson, Ash Pond 2 and Ash Pond 3/4*, has been prepared in accordance with the United States Environmental Protection Agency coal combustion residual rule, specifically 40 Code of Federal (CFR) 227.97(a) and the Georgia Environmental Protection Division Rules for Solid Waste Management 341-3-4-.10(6)(a). I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g).

**Golder Associates USA Inc.**

Dawn L. Prell  
*Senior Hydrogeologist*

Todd H. Rees, PhD, PE  
*Georgia Licensed Professional Engineer No. 047845*

## 1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (US EPA) coal combustion residuals (CCR) rule [40 Code of Federal Regulations (CFR) 257 Subpart D]; published in 80 FR 21302-21501, April 17, 2015 (CCR Rule; US EPA, 2015a), Golder Associates USA Inc. a member of WSP (Golder) has prepared this *Semi-Annual Remedy Selection and Design Progress Report Plant McDonough-Atkinson* (July 2022; Semi-Annual Progress Report) for Georgia Power the Company (Georgia Power) Plant McDonough-Atkinson Ash Pond 2, Ash Pond 3 and Ash Pond 4 (AP-2 and 3/4 or Site, or AP-2, AP-3, AP-4, respectively). Specifically, this semi-annual progress report has been prepared pursuant to 40 CFR § 257.97(a) and the Georgia Environmental Protection Division (GA EPD) Rules for Solid Waste Management 391-3-4-.10(6)(a). This semi-annual report documents activities conducted in support of the previously submitted *Assessment of Corrective Measures (ACM) Report – Plant McDonough-Atkinson Ash Pond 2 and AP-3/4* (ACM Report; Golder, 2020).

Plant McDonough, formerly a coal-fired power generating facility, was converted to a natural gas combined-cycle power generating facility in 2011. A Site location map is included as Figure 1.

Pursuant to § 257.96, Georgia Power initiated an ACM for AP-2 and 3/4 on July 9, 2020, to address the occurrences of arsenic, beryllium, cobalt and lithium in groundwater at statistically significant levels (SSLs). Subsequently, Georgia Power completed an ACM Report on December 4, 2020, and posted it to the CCR compliance website in January 2021. Since the submission of the ACM Report, selenium was identified as an SSL on February 26, 2021, at well DGWC-9 and radium was identified as an SSL at wells B-104D and B-109D on February 28, 2022. An Alternate Source Demonstration (ASD) for the occurrences of radium has been submitted to GA EPD.

The purpose of the ACM Report (and subsequent semiannual progress reports) is to document the process of evaluating and selecting corrective measure(s) to improve groundwater quality. This process is typically iterative and may be composed of multiple steps to analyze the effectiveness of corrective measures. Once potential corrective measures are identified, they are further evaluated using the criteria outlined in § 257.96(c) and Rule 391-3-4-.10(6)(a). The selected corrective measure must meet the additional protection criteria outlined in § 257.97(b) and corresponding Rule 391-3-4-.10(6)(a). Pursuant to § 257.97(a) and Rule 391-3-4-.10(6)(a), semiannual progress reports have been regularly submitted to document the efforts of evaluating and progressing toward selecting a groundwater corrective measure.

In addition to the assessment monitoring program at the Site, Georgia Power conducted a human health and ecological risk evaluation to evaluate constituents present at SSLs in groundwater (i.e., arsenic, beryllium, cobalt, and lithium) at AP-2 and 3/4 (Wood, 2020). The evaluation provides one of many lines of evidence that will be evaluated and factored into the remedy selection process. Based on this risk evaluation, concentrations of arsenic, beryllium, cobalt and lithium detected in groundwater at AP-2 and 3/4 between August 2016 and March 2020 are not expected to pose a risk to human health or the environment (Wood, 2020). Arsenic, beryllium, cobalt and lithium data collected since March 2020 are consistent with the data used in the risk evaluation; therefore, the conclusions of the *2020 Risk Evaluation Report* are supported by current conditions. The risk evaluation will be updated to include selenium and radium (as necessary), and the results will be submitted with the final Remedy Selection Report.

## 1.1 AP-2 AND 3/4 CLOSURE ACTIVITIES

At AP-2, closure by removal of ash was completed in September 2016. Following submittal of the Closure Permit Application to GA EPD in November 2018, additional verification methods were employed due to the amount of time that elapsed between the completion of CCR removal and the preparation to backfill AP-2 following removal of temporary minor stockpiles. As such, the removal verification process was repeated in 2019 ahead of proposed backfilling activities, with supplemental removal in 2019. Closure procedures included excavating all visible CCR, over excavating into the subgrade soils, and placement of topsoil and seeding for vegetative cover. A closure certification report was submitted to GA EPD on March 30, 2020, and receipt acknowledged on October 14, 2020. AP-3 and adjacent AP-4 are currently being consolidated and closed in place as combined CCR Unit AP-3/4 in accordance with § 257.102(d), no longer receive CCR, and are in the process of obtaining a solid waste permit under the GA EPD Rules for Solid Waste Management 391-3-4-.10(6).

At AP-3/4, closure is nearly complete. CCR in the eastern portion of AP-4 has been relocated to the western portion of AP-4 as well as dry stacked on AP-3. During closure, AP-3 and AP-4 are being dewatered to facilitate consolidation and closure in place. CCR has been graded within the footprint of the impoundment to create a subgrade for the final cover system. Additional dewatering has commenced to facilitate lowering of the dam. This process is expected to result in groundwater flow returning to its original, pre-construction flow direction to the south.

The *Closure Plan* (Golder, 2019) was prepared in accordance with § 257, Subpart D and meets the requirements of § 257.102(b) and following complete closure, maintenance will be provided on the final cover system for the required post-closure care period so that the integrity and effectiveness of the final cover system is maintained.

## 1.2 Evaluation of Corrective Measures

Pursuant to § 257.97, Georgia Power is evaluating the potential corrective measures in the ACM Report to identify a remedy or combination of remedies as soon as possible. The following corrective measures are potentially feasible for use at AP-2 and 3/4:

- Geochemical Approaches (In-Situ Injection)
- Hydraulic Containment (Pump and Treat)
- Monitored Natural Attenuation (MNA)
- In-Situ Solidification/Stabilization (ISS)
- Permeable Reactive Barrier (PRB)
- Phytoremediation (Phyto)
- Subsurface Vertical Barrier Wall (SVBW).

An evaluation of remedial technologies is presented in Table 1. As required by the CCR rule, this semi-annual progress report describes the progress made in selecting and designing a remedy, as well as to incorporate the SSLs of cobalt at B-56, B-63, B-93, and B-104D, as well as beryllium at B-92 and B-93.

The following remedial alternatives have been retained for further evaluation:

- **Geochemical Approaches (In-Situ Injection):** Use of an injection well network, or other means of introducing reagents or air into the subsurface, to provide suitable reagents for either anaerobic or aerobic attenuation of constituents present at SSLs including, arsenic, beryllium, cobalt, lithium and selenium. Under anaerobic conditions, arsenic would be attenuated within sparingly soluble sulfide minerals. Under aerobic conditions, soluble iron or manganese and oxygen (either via air sparging or through a chemical oxidant) would be injected to promote the formation of iron or manganese (oxy-) hydroxides for subsequent sorption of arsenic, beryllium, cobalt, selenium and to a lesser degree lithium onto these mineral phases. If sufficient iron is present in groundwater, the use of air sparging alone may be considered to precipitate iron (oxy-) hydroxides for sorption. In-situ chemical oxidation (ISCO) or in-situ chemical reduction (ISCR) can be used to chemically alter the redox environment in the subsurface to affect the mobility of certain inorganic compounds.
- **Hydraulic Containment (Pump and Treat):** Hydraulic containment involves extracting groundwater from wells or collection trenches to depress the water table and locally control the flow of groundwater. The proposed technology for a pump-and-treat system would include the installation of vertical and/or angled groundwater extraction wells downgradient of the source area. Groundwater extraction wells are feasible to install and can be designed and screened in the unconsolidated saprolite, transition zone, and fractured bedrock materials at the Site for effective hydraulic capture. Groundwater extraction wells installed in bedrock can alternatively be completed as open-hole borings to maximize groundwater removal from multiple water-bearing fracture zones at varying depths.
- **Monitored Natural Attenuation (MNA):** MNA relies on natural attenuation processes to achieve site-specific remediation objectives within a reasonable time frame relative to more active methods. Under certain conditions (e.g., through sorption, mineral precipitation, or oxidation-reduction reactions), MNA effectively reduces the dissolved concentrations of inorganic constituents in groundwater. MNA is a suitable option at the Site for the following reasons: Concentrations of the target constituents showing SSLs are stable, decreasing, or are not increasing over time based on several years of monitoring data; Iso-concentration maps show the SSL constituents are well-defined and limited in extent; and dewatering and installation of closure-cover at the Site favors restoration of natural (pre-impoundment) groundwater flow.

The following remedial alternatives have been removed from consideration:

- **In-Situ Solidification Stabilization (ISS)** – AP-2 and 3/4 is currently undergoing a closure process that includes dewatering and consolidation of ash. Ash remaining in place is unsaturated, and capped, with decreasing moisture and nearly zero infiltration rendering this remedial alternative unneeded. Other retained options are more effective in addressing groundwater corrective action.
- **Permeable Reactive Barrier (PRB)** - Other retained options are more suitable for corrective action rather than the installation of a PRB for the following reasons. A PRB can attenuate some CCR constituents at the Site, but this technology is prone to biofouling and excessive mineral precipitation, and subsequently reducing the effectiveness of the adsorption media over time. The lack of space between the unit boundary and the property line makes it a less suitable option at many areas downgradient of AP-2, and 3/4. Further, construction of a PRB is likely to impede or restrict restoration of natural groundwater flow across AP-3/4.
- **Phytoremediation (Phyto):** Other retained options are more suitable for corrective action rather than phytoremediation. In areas north and northeast of AP-3/4 limited space is available between the CCR unit

boundary and the property boundary. This combined with the presence of Site utilities makes this alternative unfeasible in this area. For areas south of AP-3, pH is the driver for the elevated cobalt concentrations. Phytoremediation is not a feasible alternative to address low pH conditions. For these reasons, phytoremediation has been removed from consideration.

- **Subsurface Vertical Barrier Wall (SVBW)** - AP-2 and 3/4 is currently undergoing a closure process that includes dewatering and consolidation of ash. Ash remaining in place is unsaturated, and capped, with decreasing moisture and nearly zero infiltration making constructing a SVBW outside the perimeter of the AP-2 and 3/4 boundary unnecessary.

### 1.3 Adaptive Site Management

Georgia Power proactively initiated adaptive Site management as outlined in the ACM Report (Golder, 2020) to support the groundwater remedy selection process and address potential changes in Site conditions as appropriate during the ash pond closure. The adaptive Site management approach takes existing Site conditions, including natural attenuation mechanisms into account. Characterization activities to evaluate attenuation mechanisms at the Site may include collection of data necessary to progressively evaluate the existing and long-term effectiveness of these processes in the aquifer and reduce uncertainty for decision making at each screening step as listed in the US EPA guidelines for MNA (US EPA 2007, 2015b). In 2007, the US EPA issued MNA technical guidance specific to inorganic contaminants (US EPA, 2007) that contained four “tiers.” The 2015 MNA guidance retains these four “tiers,” but describes them as “phases” as described below (US EPA, 2015b).

- **Phase I:** Demonstration that the groundwater plume is *not expanding*.
- **Phase II:** Determination that the *mechanism and rate* of the attenuation process are sufficient.
- **Phase III:** Determination that the *capacity* of the aquifer is sufficient to attenuate the mass of contaminant within the plume and the *stability* of the immobilized contaminant is sufficient to resist re-mobilization.
- **Phase IV:** Design of a *performance monitoring program* based on an understanding of the mechanism of the attenuation process, and establishment of contingency remedies tailored to site-specific characteristics.

Georgia Power will address Phase IV as appropriate during the development of the future corrective action monitoring plan, after the final remedy selection report.

## 2.0 SUMMARY OF WORK COMPLETED

The following subsections summarize field investigation activities and supplemental data collected since the previous *Semi-Annual Remedy Selection and Design Progress Report* (Golder, 2022a). These activities support Site characterization and delineation of Appendix IV SSLs, as well as evaluation of the corrective measures presented in the ACM Report. These data will be used to evaluate the feasibility, mechanisms, rates, and stability of identified remedial alternatives, including MNA as a corrective action to address SSLs of arsenic, beryllium, cobalt, lithium, selenium and radium in groundwater at AP-2 and 3/4. An evaluation of these data as they relate to remedy selection alternatives is ongoing and will be presented in a future report(s).

## 2.1 Nature and Extent Delineation

The January through June 2022 assessment monitoring groundwater data show SSLs at concentrations that exceed the state and/or federal Groundwater Protection Standards (GWPS) as presented in the table below. Details are provided in the *2022 Annual Groundwater Monitoring and Corrective Action Report* (Golder, 2022b).

AP-2 and 3/4 Statistically Significant Level Exceedances	
Appendix IV Parameter	AP-2 and 3/4 Monitoring Well
Arsenic	DGWC-9
Beryllium	DGWC-5, DGWC-9, DGWC-10, DGWC-47, DGWC-48, B-92, B-93
Cobalt	DGWC-8, DGWC-9, DGWC-10, DGWC-19, DGWC-20, DGWC-47, DGWC-48, B-56, B-63, B-93, B-104D
Lithium	DGWC-47, DGWC-48
Selenium	DGWC-9
Combined Radium	B-104D, B-109D

The locations of the Site monitoring wells and piezometers are shown on Figures 2. Table 2 provides a summary of well construction details for each of the Site wells and piezometers. Potentiometric surface maps of the January 2022 groundwater surface elevations are provided on Figures 3A and 3B.

Well and constituents with SSLs were further evaluated by Groundwater Stats Consulting (GSC) using the Sen's Slope/Mann Kendall trend test (Appendix B). The full report generated from the analyses is provided in Appendix D of the *2022 Annual Groundwater Monitoring and Corrective Action Report* (Golder, 2022b). The lack of increasing trends at wells where SSLs have been identified along with multiple decreasing trends confirms the chemical stability of the groundwater and the plume appears to be stable.

Based on Site data, the combined radium SSLs at the Site is the result of natural occurring radium in the bedrock influencing groundwater chemistry and not the result of a release from AP-2 and 3/4. An ASD has been prepared and submitted for the Site (Golder, 2022c). The evidence for a natural source of radium to groundwater is as follows:

- Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- Combined radium concentrations in groundwater samples collected from the deep delineation wells have decreased since well installation.
- The wells with elevated radium concentrations show low levels of CCR indicator parameters.
- Naturally occurring parent elements have been identified in bedrock samples collected from the screened intervals of the deep/bedrock delineation wells.
- Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.

Based on this demonstration (Golder, 2022c), the combined radium concentrations at the Site are attributed to a natural source, and not due to a release from the Ash Pond.

### Horizontal and Vertical Delineation

To characterize the nature and extent of arsenic, beryllium, cobalt, lithium, selenium, and combined radium SSLs, multiple piezometers have been installed and sampled at the Site (Golder, 2022d); refer to the table below for delineation status. In addition, surface water has been sampled at multiple locations to demonstrate horizontal delineation in surface water bodies where proximity to surface water prevented installation of additional piezometers. Figures 4 through 8 present isoconcentration contours for each of the constituents with an exceedance of the GWPS: arsenic, beryllium, cobalt, lithium, selenium, and combined radium.

Detection/Assessment Monitoring Well with SSL	Constituent of Concern	Vertical Delineation Well	Horizontal Delineation Well / Surface Water Monitoring Location
DGWC-5	Beryllium	B-111D	B-93, B-98, Flow is toward AP-4 <sup>[3]</sup>
DGWC-8	Cobalt	B-106D	B-88, Flow is toward AP-4 <sup>[3]</sup>
DGWC-9	Arsenic	B-101D	DGWC-10, Flow is toward AP-4 <sup>[3]</sup>
	Beryllium	B-101D	DGWC-11, Flow is toward AP-4 <sup>[3]</sup>
	Cobalt	B-101D	DGWC-11, Flow is toward AP-4 <sup>[3]</sup>
	Selenium <sup>[4]</sup>	B-101D	DGWC-10, Flow is toward AP-4 <sup>[3]</sup>
DGWC-10	Beryllium	B-102D	DGWC-11, Flow is toward AP-4 <sup>[3]</sup>
	Cobalt	B-102D	DGWC-11, Flow is toward AP-4 <sup>[3]</sup>
DGWC-19	Cobalt	B-107D	B-77
DGWC-20	Cobalt	B-108D	B-83
DGWC-47	Beryllium	B-123D / B-115D <sup>[1]</sup>	B-77
	Cobalt	B-123D / B-115D <sup>[1]</sup>	B-77
	Lithium	B-123D / B-115D <sup>[1]</sup>	B-77
DGWC-48	Beryllium	B-104D / B-122D <sup>[1]</sup>	B-83
	Cobalt	B-104D / B-122D <sup>[1]</sup>	B-83
	Lithium	B-104D / B-122D <sup>[1]</sup>	B-83
B-56	Cobalt	B-101D	B-66, Flow is toward AP-4 <sup>[3]</sup>
B-63	Cobalt	B-122D <sup>[2]</sup>	DW_US
B-92	Beryllium	B-111D	B-97, Flow is toward AP-4 <sup>[3]</sup>
B-93	Beryllium	B-111D	B-98, Flow is toward AP-4 <sup>[3]</sup>
	Cobalt	B-111D	B-98, Flow is toward AP-4 <sup>[3]</sup>
B-104D	Cobalt	B-122D <sup>[2]</sup>	B-122D <sup>[2]</sup>
	Combined Radium <sup>[4]</sup>	B-123D Pending <sup>[2]</sup>	B-122D <sup>[2]</sup>
B-109D	Combined Radium <sup>[4]</sup>	B-123D Pending <sup>[2]</sup>	B-122D <sup>[2]</sup>

Notes:

- [1] Delineation status is pending additional data collection at location B-115D, B-122D, B-123D. A minimum of four data points is needed to perform the required statistical analyses.
- [2] Monitoring wells B-122 and B-123 were installed in April/May 2022 and first sampled in June 2022. Verification sampling is ongoing.
- [3] Where groundwater flow is inward, toward AP-4, we have indicated delineation is complete.
- [4] An ASD for Combined Radium has been submitted for Plant McDonough. Georgia Power will continue to monitor the occurrence of combined radium and evaluate remedial alternatives until such time that GA EPD approves the ASD.

Based on data collected to date, the horizontal extent of target SSLs in groundwater has been determined and there are no impacts to surface water by constituents with SSLs at AP-2 and 3/4. The delineation of vertical extent of target SSLs at DGWC-47, DGWC-48 and B-104D is ongoing. Horizontal and vertical delineation is summarized below based on review of analytical results, statistical analyses and the isoconcentration contours (Figures 4-8). Details regarding the specific well pairs used for delineation and the status of delineation is described in detail in the *2022 Annual Groundwater Monitoring and Corrective Action Report* (Golder, 2022b).

## 2.2 Supplemental Data Collection and Analysis

Additional field investigation activities and data analysis have been performed to evaluate potential sources of constituents of concern as well as possible remedial alternatives. A summary of these data is described below.

### Bench-Scale Treatability Study

Terra Systems, Inc. was subcontracted to perform a bench-scale treatability study to evaluate neutralization/precipitation with potassium bicarbonate, sodium bicarbonate, and precipitation/adsorption with zero valent iron (ZVI), calcium oxide, ferric oxide and/or ferrous sulfide for two groundwater samples collected in February 2022 from AP-2 and 3/4 (DGWC-20 and DGWC-48). The objective of the bench-scale study was to evaluate in situ 'chemical sequestration' as a remediation technology for several metals including arsenic, beryllium, cobalt, lithium, and selenium and to:

- Identify the feasibility of in-situ remediation
- Determine the design parameters including reagent dosage and demand.

Results of the treatability study from AP-2 and 3/4 are as follows:

- Arsenic: Arsenic was not present in the Initial Condition (IC) for DGWC-48, so results are inconclusive. In DGWC-20, total and dissolved arsenic was present in the IC in exceedance of MCLs. During jar testing, arsenic in DGWC-20 was reduced below the MCL in the potassium and sodium bicarbonate treatments. ZVI showed no treatment for arsenic.
- Beryllium: In DGWC-48 and DGWC-20 (estimated "J", see Tables 8 and 9, Appendix D), all potassium and sodium bicarbonate treatments reduced dissolved beryllium to below the MCL; however, the ZVI treatments did not.
- Cobalt: In DGWC-48 and DGWC-20, dissolved cobalt concentrations were reduced between 54% and 76% using potassium and sodium bicarbonate, with sodium slightly outperforming potassium bicarbonate for dissolved cobalt removal. However, the observed reduction of observed cobalt was not below the GWPS.

- Lithium: None of the reagents were effective in treating dissolved lithium in groundwater sample from DGWC-48. There were only trace levels of dissolved lithium in the samples from DGWC-20.
- Selenium: Selenium was not detected in either the DGWC-48 or DGWC-20 initial characterization samples. These groundwater samples were spiked with a mixture of sodium selenite (Se<sup>4+</sup>) and sodium selenate (Se<sup>6+</sup>) to concentrations of 0.32 to 0.38 mg/L. None of the treatments reduced dissolved selenium to below the MCL. Only the highest (1.5 g/L) ZVI reduced dissolved selenium from the Control 0 by more than 50% in the DGWC-48 groundwater and no treatment reached the 50% threshold in the sample from DGWC-20.

The addition of relatively high dosages of potassium or sodium bicarbonate buffers were generally able to reach the GWPS for arsenic, and beryllium. Cobalt concentrations were reduced between 54%-76%, but GWPS were not reached. Lithium was not effectively treated in the DGWC-48 groundwater sample. Only the highest dosage of ZVI appeared to reduce selenium in one of the two groundwater samples with selenium. Tabulated results and the full treatability study summary is included in the Terra Systems, Inc. Report for Golder/WSP for Coal Combustion Residue Treatability Study Report included as Appendix C.

### Phase 2 Bench Scale Treatability Study

During June 2022, additional soils were collected from soil borings drilled adjacent to monitoring wells DGWC-68A, DGWC-69, and DGWC-40. Groundwater samples were also collected from each of these three wells as well as monitoring wells DGWC-20 and DGWC-48. Samples were submitted to Terra Systems, Inc. for a second phase of treatability study using site specific soil and groundwater. Phase 2 Jar testing replicates the Phase 1 testing with the addition of Site-specific soils/sediments into the jars to observe the effects of 'aquifer solids' materials on the various reagent's effectiveness. This study is ongoing, and results will be presented in future reports.

## 3.0 UPDATED SITE CONCEPTUAL SITE MODEL

The additional data collected since the issuance of the ACM, together with new data evaluation tools and interpretations (described in the previous semi-annual remedy selection report), allow the development of a more refined conceptual site model (CSM). The following summarizes the current understanding of the CSM within the context of selecting an appropriate groundwater corrective measure for AP-2 and 3/4.

- Data collected during this reporting period are consistent with the CSM as described in Hydrogeologic Assessment Report (HAR; Golder, 2022d).
  - Groundwater elevations recorded from Site monitoring wells have been used to update the Site potentiometric surface contour map. The groundwater flow direction interpreted during the January 2022 water level gauging event, as shown on Figures 3A and 3B, is consistent with the post closure model predictions. Groundwater flow is radial from high to low topography with an overall south-southeast flow towards the Chattahoochee River, consistent with pre-Site development conditions. Although groundwater flow is generally towards the south, monitoring wells previously established for delineation north of the unit will remain in the network for the time being.
  - Data from additional vertical delineation wells was used to refine the bedrock surface contour map. Minor modifications to the bedrock surface have been documented in the HAR and do not significantly impact the CSM (Golder, 2022d)

## 4.0 PLANNED ACTIVITIES

Georgia Power has initiated activities as outlined in the ACM Report (Golder, 2020) to support the groundwater remedy selection process and address potential changes in Site conditions as appropriate. The adaptive Site management approach toward remedy selection may be adjusted over the Site's life cycle as new Site information and technologies become available. To this end, Georgia Power will continue its data collection efforts as necessary in support of efforts to refine the CSM and to further evaluate the feasibility of each corrective measure identified in the ACM Report.

Supplementary data collection and evaluation activities proposed to be completed within the next 6 months are presented on Table 3, with the key elements summarized below.

- Evaluate results from additional groundwater quality data to complete statistical analyses of delineation data. In addition to Appendix III/IV constituents, samples may also be analyzed for major cations/anions and other parameters for characterization of groundwater and to evaluate plume stability as well as potential remedies.
- Evaluate data from groundwater samples collected from select wells at AP-2 and 3/4 for a second phase of jar testing. Phase 2 Jar testing replicates the Phase 1 testing with the addition of Site-specific soils into the jars to observe the effects of 'aquifer solids' materials on the various reagent's effectiveness.
- On-going geochemical modeling and evaluation will be performed to evaluate the cause of the cobalt exceedance at wells DGWC-19, DGWC-20, DGWC-47, and DGWC-48 and the potential that it is due to consistently low pH in that area (<5.0), while other wells near to and surrounding AP-2 and 3/4 have a higher pH (5.5 to 7.0).

Georgia Power will continue to prepare semi-annual progress reports to document AP-2 and 3/4 groundwater conditions, results associated with additional data collection, and the progress in selecting and designing a groundwater remedy in accordance with § 257.97(a). Georgia Power will include future semi-annual progress reports in routine groundwater monitoring and corrective action reports to meet the requirements of § 257.105(h)(12), § 257.106(h)(9), and § 257.107(h)(9), respectively.

Georgia Power – Plant McDonough-Atkinson Ash Pond 2 and 3/4  
Atlanta, Georgia

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)		
	Description	Performance	Reliability
<b>Geochemical Approaches (in situ injection)</b>	Use of an injection well network, or other means of introducing reagents or air into the subsurface, to provide suitable reagents for either anaerobic or aerobic attenuation of arsenic (As), beryllium (Be), cobalt (Co), lithium (Li) and selenium (Se). Under anaerobic conditions, As would be attenuated within sparingly soluble sulfide minerals. Under aerobic conditions, soluble iron or manganese and oxygen (either via air sparging or through a chemical oxidant) would be injected to promote the formation of iron or manganese (oxy-) hydroxides for subsequent sorption of As, Be, Co, Se and to a lesser degree Li onto these mineral phases. If sufficient iron is present in groundwater, the use of air sparging alone may be considered to precipitate iron (oxy-) hydroxides for sorption. In-situ chemical oxidation (ISCO) or in-situ chemical reduction (ISCR) can be used to chemically alter the redox environment in the subsurface to affect the mobility of certain inorganic compounds, including As.	The effective immobilization of As, Be, Co, Li and Se has been shown under aerobic and anaerobic conditions; however, the anaerobic approach (involving the injection of an electron donor together with iron or manganese and sulfur) requires careful study and testing. While aerobic approaches are somewhat less complex, additional aquifer characterization is needed to further evaluate these options.	Reliability dependent on permeability of the subsurface and the amount and distribution of secondary iron or manganese (oxy-) hydroxides (for aerobic approach), or electron donors and soluble iron or manganese and sulfur that can be consistently distributed (for anaerobic approach). Reliable technology if injected materials can be distributed throughout the impacted aquifer. Bench- and/or pilot-scale treatability testing programs are needed to understand the biogeochemical processes that would effectively reduce migration of As, Be, Co, Li and Se in groundwater.
<b>Hydraulic Containment (pump- and-treat)</b>	Hydraulic containment refers to the use of groundwater extraction to induce a hydraulic gradient for hydraulic capture or control the migration of impacted groundwater. This approach uses extraction wells or trenches to capture groundwater, which may subsequently require above-ground treatment and permitted discharge to a receiving water feature, reinjection into the groundwater, or reuse (e.g., land application, CCR conditioning, etc.). It is applicable to a variable mix of inorganic constituents, including dissolved As, Be, Co, Li and Se.	Pump and treat (P&T) is effective at providing hydraulic control, but it is unclear whether full groundwater remediation can be achieved without further understanding attenuation mechanisms at the Site. At AP-2 & 3/4, implementation of the corrective measure is contingent on completing additional assessment activities (i.e., high-resolution site characterization, additional pump tests, flow modeling, and capture zone analysis). This is needed to refine the constituent distribution in the subsurface to target specific zones for pumping for improved mass recovery efficiency/ effectiveness and to further evaluate the potential remedy performance.	Generally reliable for hydraulic containment, but uncertainty exists whether groundwater remediation goals can be achieved within a reasonable time frame without further understanding attenuation mechanisms.
<b>Monitored Natural Attenuation (MNA)</b>	MNA relies on natural attenuation processes to achieve site-specific remediation objectives within a reasonable time frame relative to more active methods. Under certain conditions (e.g., through sorption, mineral precipitation or oxidation-reduction reactions), MNA effectively reduces the dissolved concentrations of inorganic constituents in groundwater. Attenuation mechanisms for inorganic constituents at CCR sites, including As, Be, Co, Li and Se at AP-2 & 3/4, are either physical (e.g., dilution, dispersion, flushing, and related processes) or chemical (sorption or oxidation reduction reactions). Chemical attenuation processes include precipitation, and sorption reactions such as adsorption on the surfaces of soil minerals, absorption into the matrix of soil minerals, or partitioning into organic matter. Further, oxidation-reduction (redox) reactions, via abiotic or biotic processes, can transform the valence states of some inorganic constituents to less soluble and thus less mobile forms. For Be and Li, the main attenuation processes include sorption to iron and manganese oxides.	Physical and chemical MNA mechanisms for As, Be, Co, Li and Se, including dilution, dispersion, sorption, and oxidation reduction reactions can be effective at achieving groundwater protection standards (GWPS) within a reasonable time frame. Attenuation processes for As, Be, Co, Li and Se are already occurring at the site as evidenced by groundwater data from the delineation wells. Source control will improve the mass balance such that the buffer capacity of the aquifer is unlikely to be exhausted, and the attenuation processes already at work for As, Be, Co, Li and Se at AP-2 & 3/4 will further enhance ongoing MNA.	Reliable as long as sufficient attenuation capacity is present. MNA is reliable and can either be used as a stand-alone corrective measure for groundwater impacted by dissolved As, Be, Co, Li and Se, or in combination with a second technology.

**TABLE 1**  
**Evaluation of Remedial Technologies**  
 Georgia Power – Plant McDonough-Atkinson Ash Pond 2 and 3/4  
 Atlanta, Georgia

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)		
	Description	Performance	Reliability
<b>In-Situ Solidification / Stabilization (ISS)</b>	In-situ stabilization (ISS) is a technique that uses mixing of the CCR with additives to solidify the material in place and reduce future dissolution of CCR compounds from the stabilized material. Additives typically include Portland cement, and the solidification is completed in-situ using large diameter augers. CCR located beneath the water table would be isolated by ISS.	Medium to high, groundwater impacts would be addressed through the processes of natural attenuation. This alternative would isolate/secure the source in a bound matrix, and over time, allow the concentrations of COCs in downgradient groundwater to decline to below applicable standards.	In-situ stabilization can be a reliable corrective measure for As, Be, Co, Li and Se in groundwater. Reliability is dependent on the permeability of the subsurface and mechanics of injection.
<b>Permeable Reactive Barrier (PRB)</b>	Permeable reactive barrier (PRB) technology typically involves the installation of a permeable subsurface wall constructed with reactive media for the removal of constituents as groundwater passes through. Either ZVI-Carbon matrix or solid carbon (bio-barrier) are currently proposed for the concurrent removal of As, Be, Co, Li and Se. The carbon could be composed of peat moss, mulch or another carbon source. Exact placement of the PRB is contingent on finalization of the nature and extent characterization. PRB walls are typically keyed into the bedrock. While the shallow groundwater in the residuum and fractured bedrock is connected to the groundwater in more competent bedrock, the higher permeability/conductivity of the PRB is not expected to impede groundwater flow. PRBs can also be constructed as “funnel and gate” systems, where a barrier wall directs groundwater to a smaller “treatment gate” filled with reactive media.	PRBs have been shown to effectively address As, Be, Co, Li and Se in groundwater, but additional testing is required for Be and Li to select the appropriate reactive media. The approach is expected to achieve GWPS for both constituents as impacted groundwater passes through the reactive barrier. Certain redox kinetics may be slow and hence a thicker wall might be needed. Furthermore, additional testing is required to select the appropriate sorptive media mix, especially related to Be and Li.	Reliable groundwater corrective measure technology, but loss of reactivity over time may require re-installation depending on the duration of the remedy. Additional data collection, including conducting a bench and/or pilot study, is needed to better characterize current attenuation mechanisms and/or select the appropriate reactive media mix for a PRB wall.
<b>Phyto Remediation (Phyto)</b>	Phytoremediation uses trees and other plants to degrade or immobilize constituents or achieve hydraulic control without the need for an above-ground water treatment system and infrastructure. Within the context of AP-2 & 3/4, this corrective measure would likely be applied along the point of compliance or downgradient edge of the impacted groundwater for hydraulic control. The system promotes root development to the targeted groundwater zone (depth), allowing for hydraulic control of impacted groundwater. In addition, immobilization of As, Be, Co, Li and Se within the root zone as well as incidental uptake of dissolved As, Be, Co, Li and Se with groundwater is expected to occur concurrent with hydraulic control.	Once established (typically at the end of the third growing season), a phytoremediation ‘system’ is effective for providing hydraulic containment of groundwater, and potential reduction of As, Be, Co, Li and Se concentrations through immobilization and/or uptake and sequestration in the tree biomass; however, the main purpose is to provide hydraulic control. However, changing site conditions may make the corrective measure viable for the area downgradient of AP-2 & 3/4. Additional aquifer testing and/or groundwater flow modeling may be needed to confirm the suitability at that time.	Engineered phytoremediation is a proven technology where hydrogeologic factors are taken into account (e.g., hydraulic conductivity, flow velocity, depth to impacted groundwater zone, etc.). This is considered an active remedial approach through the use of trees as the “pumps” driving the system. Careful design will be needed to select the proper species, which will include consideration of groundwater chemistry, plant uptake of constituents, and groundwater flow.

 Atlanta, Georgia

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)		
	Description	Performance	Reliability
<b>Subsurface Vertical Barrier Walls</b>	<p>This approach involves placing a barrier to groundwater flow in the subsurface, frequently around a source area, to prevent future migration of dissolved constituents in groundwater from beneath the source to downgradient areas. In general, barrier walls are designed to provide containment; localized treatment achieved through the sorption or chemical precipitation reactions from construction of the walls are incidental to the design objective. Barrier walls can also be used in downgradient applications to limit discharge to a surface water feature or to reduce aquifer recharge from an adjacent surface water feature when groundwater extraction wells are placed near one. A variety of barrier materials can be used, including cement and/or bentonite slurries, geomembrane composite materials, or driven materials such as steel or vinyl sheet pile. Groundwater extraction from upgradient of the barrier is required to avoid groundwater mounding behind the barrier.</p>	<p>Barrier walls are a proven technology for seepage control and/or groundwater cutoff at impoundments. Slurry walls are limited by the depth of installation, which is approximately 90 ft below ground surface. However, site-specific geologic and technology-specific considerations may limit this depth to shallower installations. Additional subsurface investigations, aquifer testing, and compatibility testing with site-specific groundwater will be needed.</p>	<p>Generally reliable as a barrier to groundwater flow; however, treatment of downgradient groundwater is incidental and not the primary objective.</p>

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)		
	Ease of Implementation	Potential Impacts	Time Requirement to Begin/Complete
<b>Geochemical Approaches (in situ injection)</b>	Moderate. Installation of injection well network or other injection infrastructure would be required. Alternative installation approaches may be considered, such as along the downgradient edge of impacted groundwater, which would function similar to a PRB application. Potential for clogging of aquifer matrix and/or injection well infrastructure. Chemical distribution during injections (i.e., radius of influence) needs to be evaluated.	Minimal impacts are expected if remedy works as designed, based on a thorough pre-design investigation, geochemical modeling, and bench/pilot study results. Redox-altering processes have the potential to mobilize naturally-occurring constituents as an unintended consequence if not properly studied and implemented.	Installation of the injection network can be accomplished relatively quickly (1 to 2 months). However, a thorough pre-design investigation, geochemical modeling, and/or bench- and/or pilot-testing will be required to obtain design parameters prior to design and construction of the corrective measure, which may take up to 24 months. Once installed, the time required to achieve GWPS within the treatment area may be relatively quick but depends on the attenuation process kinetics of each targeted constituent. The time for complete distribution of the injected materials throughout the treatment area is also variable.
<b>Hydraulic Containment (pump- and-treat)</b>	Moderate. Proven approach, and supplemental installation of extraction wells/trenches is fairly straightforward. The extracted groundwater may potentially require an above-ground treatment system. A variety of sorption and precipitation approaches exist for ex-situ treatment of As, Be, Co, Li and Se. Operation and maintenance (O&M) requirements are expected to include upkeep of infrastructure components (pumps, pipes, tanks, instrumentation and controls, above-ground treatment system) and handling of treatment residuals.	Moderate. The main potential impacts are related to the presence and operation of an on-site above-ground water treatment facility and related infrastructure to convey and treat extracted groundwater. Pumping activity may unintentionally alter the geochemistry within the hydraulic capture zone.	Installation of extraction wells and/or trenches can be accomplished relatively quickly (1 to 2 months). However, additional aquifer testing, system design and installation, and permit approval may be required, which may take up to 24 months. The initiation of the approach would be contingent on the start-up of the wastewater treatment infrastructure. Hydraulic containment can be achieved relatively quickly after startup of the extraction system, but uncertainty exists with respect to the time to achieve GWPS without additional data collection to better understand attenuation mechanisms for As, Be, Co, Li and Se.
<b>Monitored Natural Attenuation (MNA)</b>	Reasonably implementable with respect to infrastructure, but moderate to complex with respect to documentation. Proven approach, but additional data are needed to show that the existing attenuation capacity is sufficient to meet site objectives within a reasonable timeframe. A monitoring well network already exists to implement future groundwater monitoring efforts.	None. MNA relies on the natural processes active in the aquifer matrix to reduce constituent concentrations without disturbing the surface or the subsurface.	The infrastructure to initiate MNA is already in place. Demonstrating attenuation mechanisms and capacity can be time-consuming and can take up to 24 months. MNA is expected to be successful within a reasonable time frame following pond closure. Engineering measures will be implemented during closure of AP-2 & 3/4 to minimize potential impacts to the subsurface during closure activities and routine groundwater monitoring will be used to verify that groundwater impacts remain stable or decrease over time.

**TABLE 1**

 Georgia Power – Plant McDonough-Atkinson Ash Pond 2 and 3/4  
 Atlanta, Georgia

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)		
	Ease of Implementation	Potential Impacts	Time Requirement to Begin/Complete
<b>In-Situ Solidification / Stabilization (ISS)</b>	Easy to moderate, implementation of ISS will require a detailed design effort with bench scale testing to determine the appropriate amendment mix for a variety of overburden geologic materials. Pilot testing will also be needed to verify the ability of equipment to solidify material at depth. ISS has not been commonly used to stabilize entire ash units as part of a closure strategy.	Potential impacts of the remedy will be negligible.	In-situ stabilization of AP-2 & 3/4 is predicted to take a number of years to complete, depending on the availability of specialized contractors and equipment.
<b>Permeable Reactive Barrier (PRB)</b>	Moderate to difficult. Trenching would be required to install a mix of reactive materials in the subsurface. Continuous trenching may be the most feasible construction method. Installation methods and materials are readily available. Once installed, treatment will be passive and O&M requirements are minimal if replacement of the PRB is not necessary.	Minimal impacts are expected following the construction of the remedy. However, ZVI has the potential to create anaerobic conditions downgradient of the PRB wall that may mobilize redox-sensitive naturally-occurring constituents. These conditions need to be carefully monitored. Short-term impacts during the construction of the remedy can be mitigated through appropriate planning and health and safety measures.	Installation of a PRB can be accomplished relatively quickly (6 to 12 months), depending on the final location and configuration. However, bench- and/or pilot-testing would be required to obtain design parameters prior to design and construction of the remedy, which may take up to 24 months. Once installed, the time to achieve GWPS downgradient of the PRB is anticipated to be relatively quick.
<b>Phyto Remediation (Phyto)</b>	Reasonably implementable to moderate. Engineered approach has been proven effective, and specific depth zones can be targeted. Trees are installed to get the roots deep enough to intercept impacted groundwater flow paths. Area must be clear of above and below-ground structures (e.g., power lines). The system, once established (approximately three growing seasons), is a self-maintaining, sustainable remedial system that has no external energy requirements and little maintenance (i.e., efforts normally associated with landscaping).	Minimal impacts are expected. In fact, there are several positive impacts expected, including enhanced aesthetics, wildlife habitat, and limited energy consumption.	The design phase will require some groundwater modeling, which may take up to 6 months. Depending on the number of required units, the installation effort is expected to last several weeks. Hydraulic capture/control is expected approximately three years after planting and system performance is expected to further improve over time.
<b>Subsurface Vertical Barrier Walls</b>	Moderate to difficult. Trenching will be required to fill in the various slurry mixes; alternatively, sheet pile installations can be accomplished without excavation of trenches. The application of barrier walls is limited by the depth of installation, which similar to PRBs, should be keyed into a low permeability layer such as a thick clay layer or bedrock. Installation methods and materials are readily available. Once installed, above-ground infrastructure to pump and treat groundwater will be required. O&M requirements are expected to include upkeep of infrastructure components (pumps, pipes, tanks, instrumentation and controls, above-ground treatment system) and handling of treatment residuals.	Minimal impacts are expected following the construction of the remedy. Short-term impacts during the construction of the remedy can be mitigated through appropriate planning and health and safety measures. Changes to groundwater flow patterns due to installation of the barrier wall are expected, which can affect other aspects of groundwater corrective action. Pumping activity may unintentionally alter the geochemistry within the hydraulic capture zone that may result in the mobilization of other constituents that may require treatment.	Installation of a barrier wall can be accomplished relatively quickly (6 to 12 months), depending on the final location and configuration. However, some design phase and additional aquifer and compatibility testing will be required, which may take up to 24 months. Once installed, preventing migration of constituents dissolved in groundwater is anticipated to be relatively quick. Since this approach does not treat the downgradient area of impacted groundwater but prevents migration from a source area, it will likely have to be maintained long-term and coupled with other approaches.

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)			Retention Evaluation
	Institutional Requirements	Other Env. Or Public Health Requirements	Relative Costs	
<b>Geochemical Approaches (in situ injection)</b>	Deed restrictions may be necessary until in-situ treatment has achieved GWPS. A new underground injection control (UIC) permit (for in-situ injections) would be required to implement this corrective measure. No other institutional requirements are expected at this time.	None expected at this point. Potential for mobilization of redox-sensitive constituents exists during implementation of an anaerobic attenuation approach. Following installation, the remedy is passive.	Medium (depending on expanse of injection network required and injectate volume required per derived design parameters)	Retained for further analysis; can be applied to As, Be, Co, and Se as a sparingly-soluble mineral, or could be applied to raise the groundwater pH to promote immobilization through sorption mechanisms. Additional evaluation required to determine likelihood to treat Li.
<b>Hydraulic Containment (pump- and-treat)</b>	Depending on the effluent management strategy, modifications to the existing NPDES permit may be required, or obtaining a new underground injection control (UIC) permit may be needed if groundwater reinjection is chosen. In addition, deed restrictions may be required as long as groundwater conditions are above regulatory standards for unrestricted use.	Above-ground treatment components may need to be present for an extended period of time, generating residuals requiring management and disposal.	Medium to high (depending on remedy duration, complexity of above-ground treatment system, and volume of water processed)	Retained for further analysis; extracted water could be routed to wastewater treatment infrastructure built for dewatering and closure of ponds at the site. Could be considered an effective measure to maintain hydraulic control.
<b>Monitored Natural Attenuation (MNA)</b>	MNA may require the implementation of institutional controls, such as deed restrictions, to preclude potential exposure to groundwater within the footprint of impacted groundwater until GWPS are achieved.	Little to no physical disruption to remediation areas and no adverse construction-related impacts are expected on the surrounding community.	Low to medium	MNA is a suitable option at the Site for the following reasons: Concentrations of the target constituents showing SSLs are stable, decreasing, or are not increasing over time based on several years of monitoring data; Iso-concentration maps show the SSL constituents are well-defined and limited in extent; and dewatering and installation of closure-cover at the Site favors restoration of natural (pre-impoundment) groundwater flow.
<b>In-Situ Solidification / Stabilization (ISS)</b>	Deed restrictions may be necessary until groundwater concentrations are below GWPS. No other institutional requirements that may limit application of this technology are expected at this time.	Changes to groundwater chemistry relative to the mobility of Appendix IV constituents following completion of ISS, where large volumes of amendments (typically Portland cement) are added to the subsurface, are unknown and would require pilot testing.	Medium, depending on permeability of aquifer	Not retained for further analysis. AP-2 and 3/4 is currently undergoing a closure process that includes dewatering and consolidation of ash. Ash remaining in place is unsaturated, and capped, with very little moisture or infiltration rendering this remedial alternative unneeded. Other retained options are more effective in addressing groundwater corrective action.

**TABLE 1**  
**Evaluation of Remedial Technologies**  
 Georgia Power – Plant McDonough-Atkinson Ash Pond 2 and 3/4  
 Atlanta, Georgia

Corrective Measure	REGULATORY CITATION FOR CRITERIA: 40 CFR 257.96(C)(1)			Retention Evaluation
	Institutional Requirements	Other Env. Or Public Health Requirements	Relative Costs	
<b>Permeable Reactive Barrier (PRB)</b>	Deed restrictions may be necessary for groundwater areas upgradient of the PRB (if not installed along the waste boundary). No other institutional requirements are expected at this time.	None expected at this point. Following installation, the remedy is passive. However, certain treatment media (such as ZVI) have the potential to mobilize naturally-occurring constituents downgradient of the PRB.	Medium to high (for installation) - minimal O&M requirements if replacement is not necessary	Not retained for further analysis; a PRB cannot treat groundwater downgradient of the constructable alignment; there is minimal space available downgradient of the impacted wells; potential for increased maintenance due to potential biofouling and mineral precipitation. Further, construction of a PRB is likely to impede or restrict restoration of natural groundwater flow across AP-3/4.
<b>Phyto Remediation (Phyto)</b>	No institutional requirements are expected at this time.	None expected at this point. Following installation, the remedy is passive and does not require external energy.	Medium (for installation) - minimal O&M requirements	Not retained for further analysis; In areas north and northeast of AP-3/4 limited space is available between the CCR unit boundary and the property boundary and combined with the presence of site utilities makes this alternative unfeasible in this area. For areas south of AP-3, pH is the driver for the elevated cobalt concentrations. Phytoremediation is not a feasible alternative to address low pH conditions.
<b>Subsurface Vertical Barrier Walls</b>	Deed restrictions may be necessary for groundwater areas downgradient of the barrier wall until remedial goals are met. No other institutional requirements are expected at this time.	Due to the need for groundwater extraction associated with barrier walls, above-ground treatment components may need to be present for an extended period of time, generating residuals requiring management and disposal.	Medium to high (depending on length and depth of wall, remedy duration and complexity of above-ground treatment system)	Not retained for further analysis. A SVBW cannot treat groundwater downgradient of the constructable alignment; there is minimal space available downgradient of the impacted wells.

**TABLE 3**  
**Proposed ACM Supplemental Data Collection Tasks for July through December 2022**  
 Georgia Power – Plant McDonough-Atkinson AP-2 and 3/4  
 Atlanta, Georgia

Data Collection Event	Applicable CMs	Applicability / Rationale	Field Component	Parameters of Interest (POI)
<b>Groundwater Sampling</b>	ISI MNA	(i) Evaluation of attenuation mechanisms and rates and aquifer capacity for attenuation. (ii) Continue sampling to provide sufficient data for statistical analyses at assessment wells. (iii) Determine the viability of in-situ injections for remedy selection.	Collect groundwater samples from existing well network currently sampled under the assessment monitoring program as well as additional site piezometers within migration pathway.	In addition to routine App III/IV parameters; sulfide, iron, manganese, magnesium, sodium, potassium, bicarbonate alkalinity, dissolved organic carbon (DOC), and total hardness to be collected at select locations.  Additional volume to submit for Phase 2 Jar Testing to be performed at select locations (DGWC-19, DGWC-20, DGWC-47, DGWC-48).
<b>Soil Sampling</b>	ISI MNA	Evaluate the effectiveness of different injection media for treatment of arsenic, beryllium, cobalt, lithium, and selenium.	Collect soil samples from soil borings near DGWC-19, DGWC-20, DGWC-47, DGWC-48.	Perform Phase 2 Jar Testing using soil/sediments and groundwater from the site to evaluate effects of 'aquifer solids' on the various reactant's (e.g. potassium bicarbonate) treatment effectiveness.
<b>Geochemical Modeling</b>	ISI MNA	MNA as a component of Final Remedy Selection Support development of injection media for ISI.	No Field Component: Phase II & III geochemical modeling and assessment.	Geochemical modeling performed to evaluate the cause of the cobalt exceedance at wells DGWC-19, DGWC-20, DGWC-47 and 48 and the potential that it is due to consistently low pH in that area (<5.0), while near to and surrounding AP-2 and 3/4 have a higher pH (5.5 to 7.0).

Applicable Corrective Measures (CM Retained):

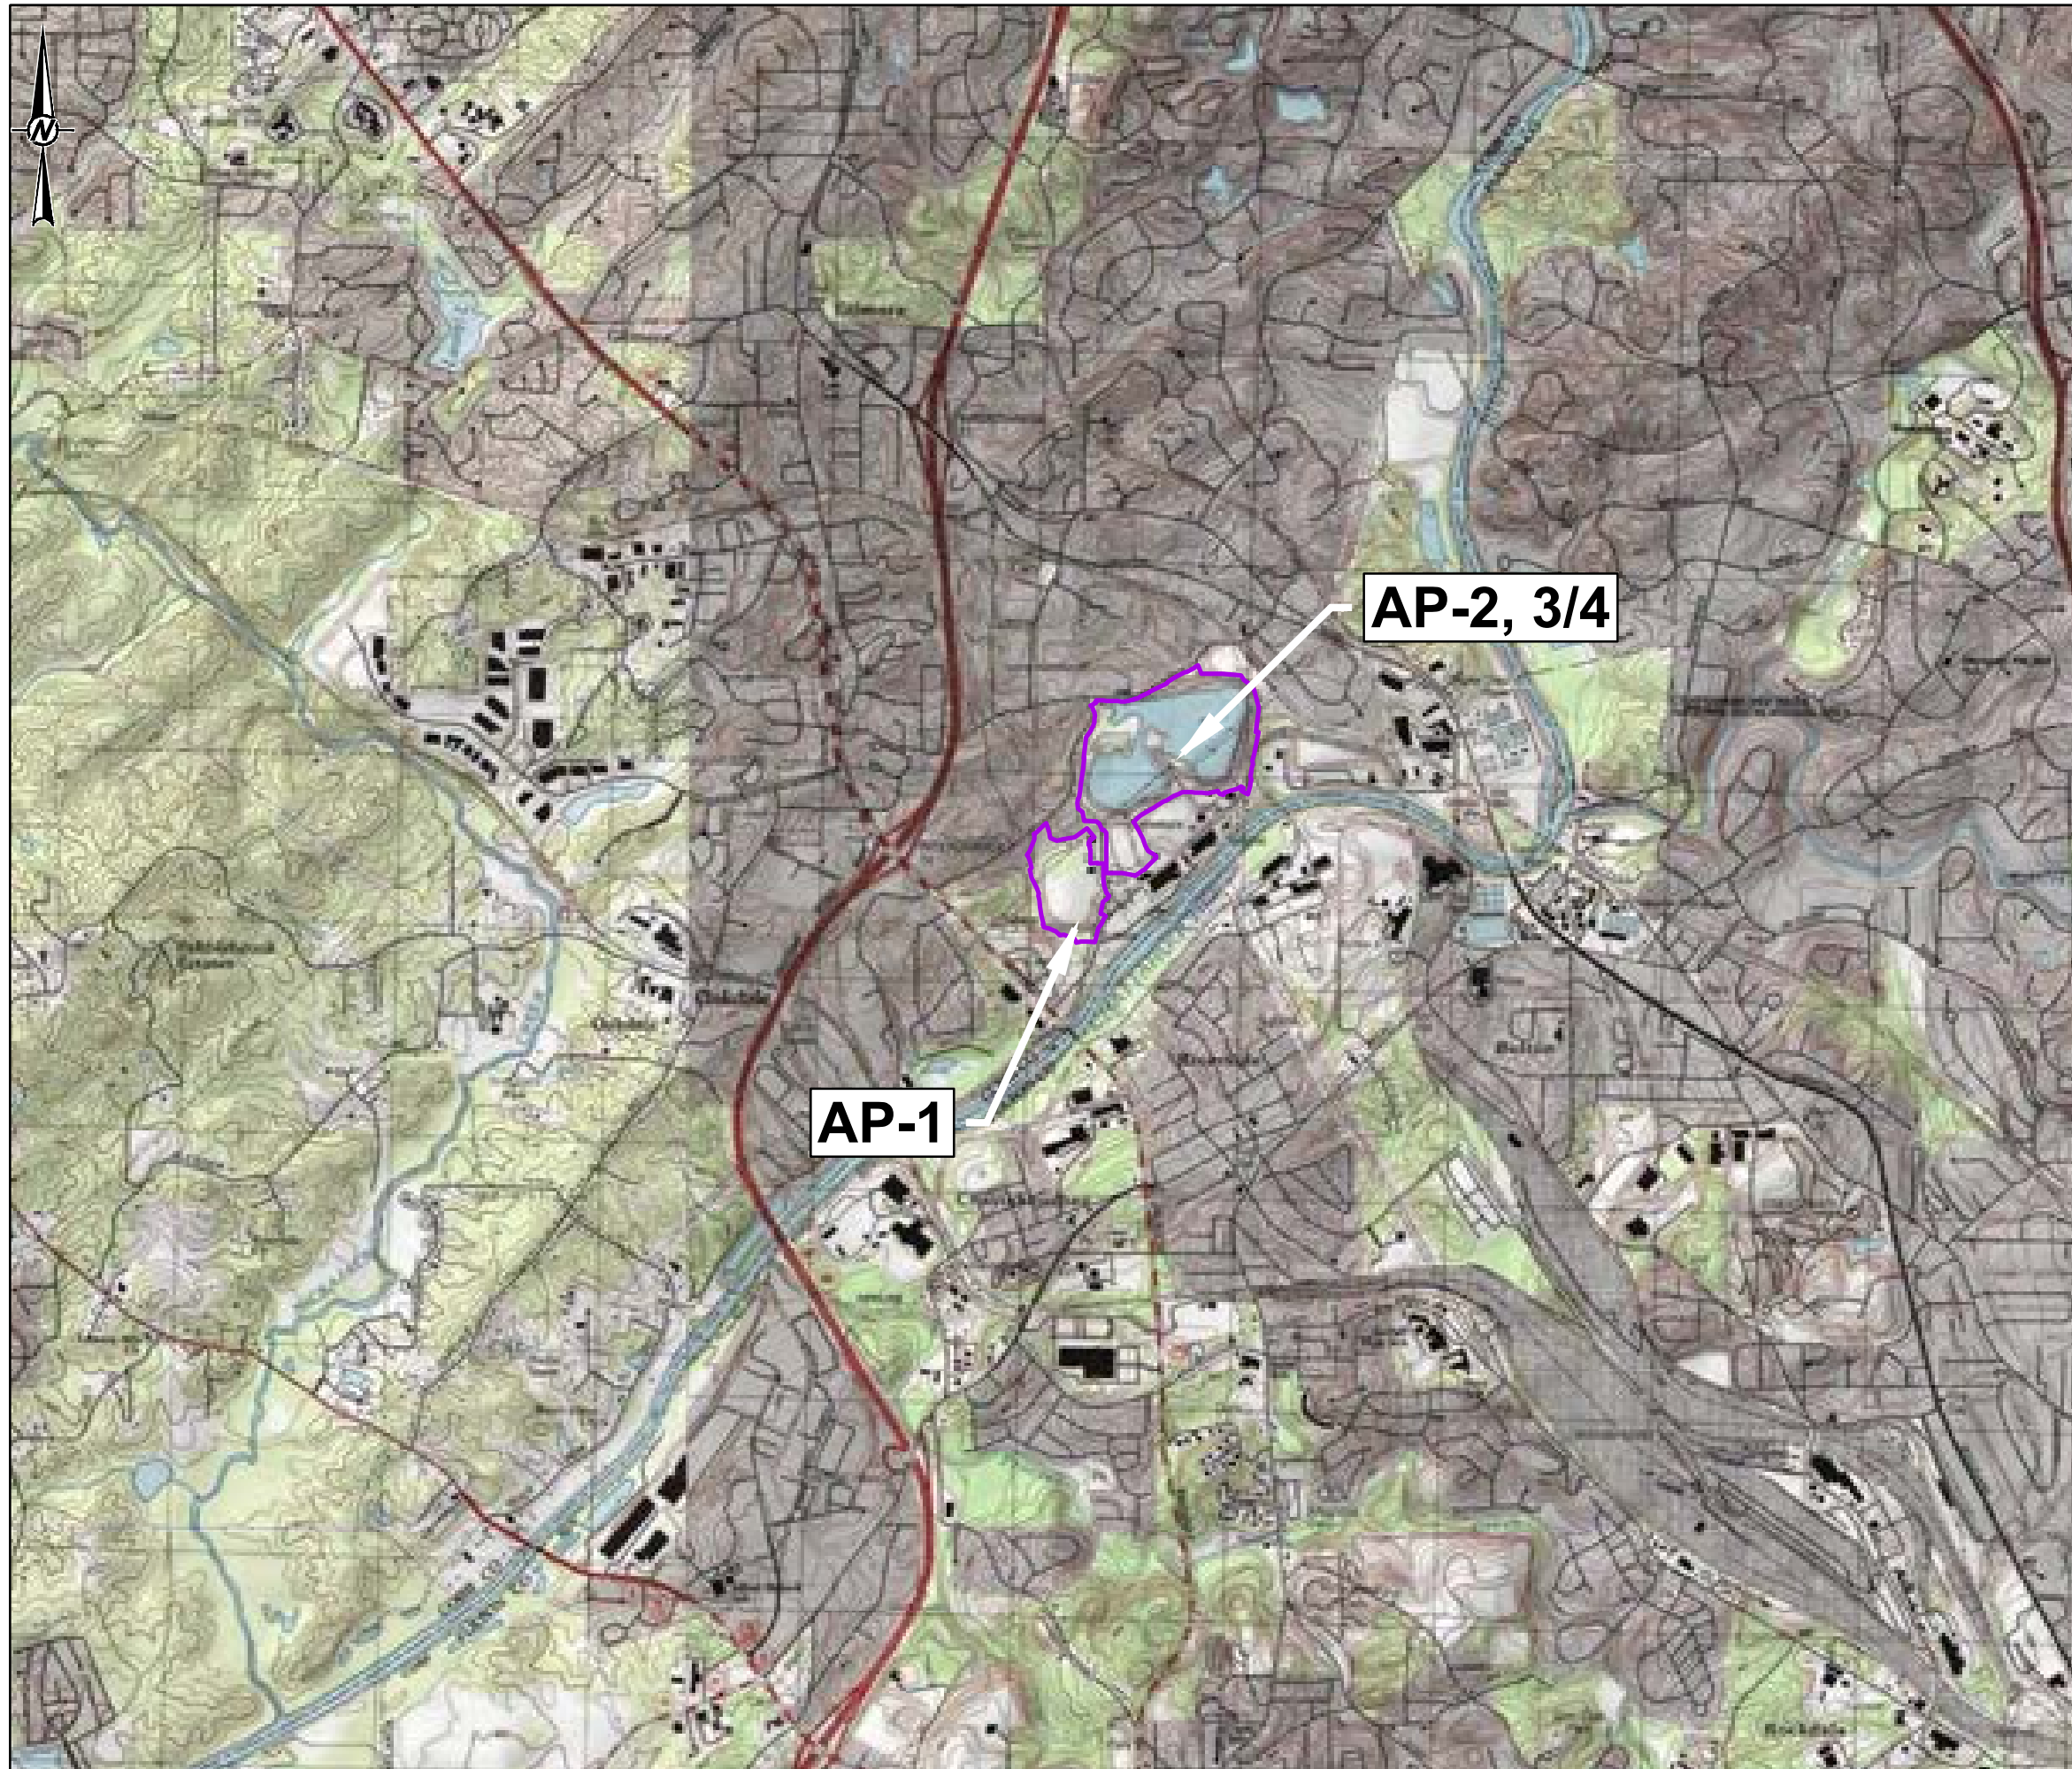

ISI - Geochemical Approaches (In-Situ Injection);

P&T - Hydraulic Containment (Pump and Treat);

MNA - Monitored Natural Attenuation

## Qualifiers

### Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
▫	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

# Case Narrative

Client: Golder Associates Inc.  
Project/Site: Plant McDonough (166949621)

Job ID: 140-26651-1

## Job ID: 140-26651-1

### Laboratory: Eurofins Knoxville

#### Narrative

#### Job Narrative 140-26651-1

#### Receipt

The sample was received on 1/12/2022 at 10:00am and arrived in good condition. The temperature of the cooler at receipt was 20.2° C.

#### Receipt Exceptions

The Field Sampler was not listed on the Chain of Custody.

The following sample was received at the laboratory outside the required temperature criteria: B-117D (52-52.5') (140-26651-1). This does not meet regulatory requirements. The client was contacted regarding this issue, and the laboratory was instructed to proceed with analysis.

#### Metals

##### 7 Step Sequential Extraction Procedure

These soil samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0008, "7 Step Sequential Extraction Procedure". SW-846 Method 6010B as incorporated in Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0007 was used to perform the final instrument analyses.

An aliquot of each sample was sequentially extracted using the steps listed below:

- Step 1 - Exchangeable Fraction: A 5 gram aliquot of sample was extracted with 25 mL of 1M magnesium sulfate (MgSO<sub>4</sub>), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 2 - Carbonate Fraction: The sample residue from step 1 was extracted with 25 mL of 1M sodium acetate/acetic acid (NaOAc/HOAc) at pH 5, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 3 - Non-crystalline Materials Fraction: The sample residue from step 2 was extracted with 25 mL of 0.2M ammonium oxalate (pH 3), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 4 - Metal Hydroxide Fraction: The sample residue from step 3 was extracted with 25 mL of 1M hydroxylamine hydrochloride solution in 25% v/v acetic acid, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 5 - Organic-bound Fraction: The sample residue from step 4 was extracted three times with 25 mL of 5% sodium hypochlorite (NaClO) at pH 9.5, centrifuged and filtered. The resulting leachates were combined and 5 mL were digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 6 - Acid/Sulfide Fraction: The sample residue from step 5 was extracted with 25 mL of a 3:1:2 v/v solution of HCl-HNO<sub>3</sub>-H<sub>2</sub>O, centrifuged and filtered. 5 mL of the resulting leachate was diluted to 50 mL with reagent water and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- Step 7 - Residual Fraction: A 1.0 g aliquot of the sample residue from step 6 was digested using HF, HNO<sub>3</sub>, HCl and H<sub>3</sub>BO<sub>3</sub>. The digestate was analyzed by ICP using method 6010B. Results are reported in mg/kg on a dry weight basis.

In addition, a 1.0 g aliquot of the original sample was digested using HF, HNO<sub>3</sub>, HCl and H<sub>3</sub>BO<sub>3</sub>. The digestate was analyzed by ICP using method 6010B. Total metal results are reported in mg/kg on a dry weight basis.

Results were calculated using the following equation:

$$\text{Result, } \mu\text{g/g or mg/Kg, dry weight} = (C \times V \times V1 \times D) / (W \times S \times V2)$$

Where:

C = Concentration from instrument readout,  $\mu\text{g/mL}$

V = Final volume of digestate, mL

D = Instrument dilution factor

# Case Narrative

Client: Golder Associates Inc.  
Project/Site: Plant McDonough (166949621)

Job ID: 140-26651-1

## Job ID: 140-26651-1 (Continued)

### Laboratory: Eurofins Knoxville (Continued)

V1 = Total volume of leachate, mL  
V2 = Volume of leachate digested, mL  
W = Wet weight of sample, g  
S = Percent solids/100

A method blank, laboratory control sample and laboratory control sample duplicate were prepared and analyzed with each SEP step in order to provide information about both the presence of elements of interest in the extraction solutions, and the recovery of elements of interest from the extraction solutions. Results outside of laboratory QC limits do not reflect out of control performance, but rather the effect of the extraction solution upon the analyte.

A laboratory sample duplicate was prepared and analyzed with each batch of samples in order to provide information regarding the reproducibility of the procedure.

#### SEP Report Notes:

The final report lists the results for each step, the result for the total digestion of the sample, and a sum of the results of steps 1 through 7 by element.

Magnesium was not reported for step 1 because the extraction solution for this step (magnesium sulfate) contains high levels of magnesium. Sodium was not reported for steps 2 and 5 since the extraction solutions for these steps contain high levels of sodium. The sum of steps 1 through 7 is much higher than the total result for sodium and magnesium due to the magnesium and sodium introduced by the extraction solutions.

The digestates for steps 1, 2 and 5 were analyzed at a dilution due to instrument problems caused by the high solids content of the digestates. The reporting limits were adjusted accordingly.

Method 6010B: The serial dilution performed for the following samples associated with batch 140-60348 was outside control limits: (140-26651-A-1-A SD), (140-26651-A-1-A SD ^5) and (140-26651-A-1-A SD ^50)

Method 6010B: The following sample was diluted due to the presence of Titanium which interferes with Cobalt: B-117D (52-52.5') (140-26651-1). Elevated reporting limits (RLs) are provided.

Methods 6010B, 6010B SEP: The following sample was diluted to bring the concentration of target analyte, Aluminum, within the calibration range: B-117D (52-52.5') (140-26651-1). Elevated reporting limits (RLs) are provided.

Method 6010B SEP: The sample duplicate (DUP) precision for preparation batch 140-60023, 140-60073 and 140-60153 and analytical batch 140-60317 was outside control limits. Sample matrix interference is suspected.

Method 6010B SEP: The serial dilution performed for the following sample associated with batch 140-60317 was outside control limits: B-117D (52-52.5') (140-26651-1) Sample matrix effects suspected.

Method 6010B SEP: The sample duplicate (DUP) precision for preparation batch 140-60194 and analytical batch 140-60348 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Quantitative X-Ray Diffraction by Rietveld Refinement

**Report Prepared for:** *Golder Associates Inc*  
**Project Number/ LIMS No.** *18502-05/MI5010-MAY22*  
**Sample Receipt:** *May 8, 2022*  
**Sample Analysis:** *May 13, 2022*  
**Reporting Date:** *June 8, 2022*

---

**Instrument:** BRUKER AXS D8 Advance Diffractometer  
**Test Conditions:** Co radiation, 35 kV, 40 mA; Detector: LYNXEYE  
Regular Scanning: Step: 0.02°, Step time: 0.75s, 2θ range: 6-80°  
**Interpretations :** PDF2/PDF4 powder diffraction databases issued by the International Center for Diffraction Data (ICDD). DiffracPlus Eva and Topas software.  
**Detection Limit :** 0.5-2%. Strongly dependent on crystallinity.

---

**Contents:**  
1) Method Summary  
2) Quantitative XRD Results  
3) XRD Pattern(s)

---

Kim Gibbs, H.B.Sc., P.Ge.  
Senior Mineralogist

---

Huyun Zhou, Ph.D., P.Ge.  
Senior Mineralogist

**ACCREDITATION:** SGS Natural Resources Lakefield is accredited to the requirements of ISO/IEC 17025 for specific tests as listed on our scope of accreditation, including geochemical, mineralogical and trade mineral tests. To view a list of the accredited methods, please visit the following website and search SGS Canada Inc. - Minerals: <https://www.scc.ca/en/search/palcan>.

## Method Summary

The Rietveld Method of Mineral Identification by XRD (ME-LR-MIN-MET-MN-D05) method used by SGS Natural Resources is accredited to the requirements of ISO/IEC 17025.

### ***Mineral Identification and Interpretation:***

Mineral identification and interpretation involves matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

### ***Quantitative Rietveld Analysis:***

Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

**DISCLAIMER:** This document is issued by the Company under its General Conditions of Service accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

**WARNING:** The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted.

## Summary of Rietveld Quantitative Analysis X-Ray Diffraction Results

**APPENDIX C**

**TERRA SYSTEMS, INC. TREATABILITY STUDY  
REPORT**

July 20, 2022

**Todd Rees, PhD, PE**  
*Senior Program Leader*

 **GOLDER** Associates Inc.  
Amherst, MA., Montrose, CO.

## **TERRA SYSTEMS, INC. FINAL REPORT FOR GOLDBER/WSP FOR COAL COMBUSTION RESIDUE AT PLANT MCDONOUGH ATKINSON ASH POND 1, 2, 3, AND 4 TREATABILITY STUDY VERSION 6**

### **1.0 INTRODUCTION**

Coal combustion residue landfill may generate acidic conditions which allow metals such as arsenic (As), beryllium (Be), cobalt (Co), lithium (Li), molybdenum (Mo), and selenium (Se) to accumulate to levels above regulatory limits. This bench-scale treatability evaluated neutralization/precipitation with potassium bicarbonate, sodium bicarbonate, and calcium oxide and precipitation/adsorption with zero valent iron (ZVI), ferrous oxide, and ferrous sulfide for five groundwaters from Georgia Power Company (Georgia Power) Plant McDonough-Atkinson Ash Pond 1 (AP-1) which has arsenic and molybdenum in two groundwaters (DGWC-69 and DGWC-68A) and cobalt in DGWC-40. Plant McDonough-Atkinson Ash Pond 2, Ash Pond 3 and Ash Pond 4 (AP-2 and 3/4) has arsenic, beryllium, cobalt, lithium, and selenium in two groundwaters (DGWC-48 and DGWC-20). The Georgia Groundwater Protection Standards (GA GWPS) is 0.010 mg/L for arsenic, 0.0040 mg/L for beryllium, 0.032 mg/L for cobalt, 0.10 mg/L for lithium, 0.10 mg/L for molybdenum, and 0.050 mg/L for selenium.

### **2.0 BENCH-SCALE STUDY SCOPE**

The objective of the bench-scale study is to evaluate the appropriate in situ remediation technology for several metals including arsenic, cobalt, beryllium, lithium, molybdenum, and selenium:

- Identify the feasibility of in-situ remediation.
- Determine the design parameters including reagent dosage and demand.

The bench-scale treatability study will investigate six reagents: potassium bicarbonate, sodium bicarbonate, calcium oxide, iron oxide, ferrous sulfide, and zero valent iron.

#### **2.1 Reagent Selection**

The bench-scale treatability study assumes that one of the following technologies can be used for in-situ remediation of the metals:

- elevated pH precipitation
- oxidation with iron oxide
- reduction with ferrous sulfide
- oxidation and precipitation with calcium oxide
- direct sorption/precipitation onto the ZVI.

All reagents used for the bench-scale test were commercially available products. The reagent usages and their dosages could be adjusted according to the results of the activities and observations during the execution of the bench-scale treatability study. The following provides more detail on each of the reagents proposed for the bench-scale treatability testing:

- **Potassium Bicarbonate:** Potassium bicarbonate can increase the pH up to about 8.2 SU. Four loadings of LC Carlsen potassium bicarbonate were evaluated in the tests to determine the precipitation of arsenic and molybdenum in two groundwaters from AP-1 (DGWC-69 and DGWC-68A); four loadings of potassium bicarbonate to address cobalt from one groundwater in AP-1 DGWC-40; and four loadings of potassium bicarbonate to address arsenic, beryllium, cobalt, lithium, and selenium in AP 234 (DGWC-48 and DGWC-20).
- **Sodium Bicarbonate:** Sodium bicarbonate can increase the pH up to about 8.3 SU. Four loadings of Genesis sodium bicarbonate were evaluated in the tests to determine precipitation of cobalt from one groundwater in AP-1 (DGWC-69 and DGWC-68A); and four loadings of sodium bicarbonate to address arsenic, beryllium, cobalt, lithium, and selenium in AP 234 (DGWC-48 and DGWC-20).
- **ZVI:** ZVI can enhance precipitation of cobalt and can sorb this metal. A commercially available product of submicron ZVI (Ferox Nanostar) from Hepure (Flemington NJ) and Nanoiron s.r.o (Zudicgivue, Czech Republic) were evaluated. Three loadings of ZVI were evaluated in the tests to determine the precipitation/sorption of arsenic and molybdenum will be evaluated in the groundwater from AP-1 DGWC-69 and DGWC-68A; determine precipitation of cobalt from one groundwater in AP-1 (DGWC-40); and to address arsenic, beryllium, cobalt, lithium, and selenium in AP-234.
- **Calcium oxide.** Calcium oxide is prepared by heating limestone. In water, it will form calcium hydroxide. Calcium hydroxide has a solubility of about 1.6 g/L and a pH of 12.5 SU. Three loadings of Sigma Aldrich >98% calcium oxide were evaluated for the precipitation of arsenic and molybdenum in two groundwaters from AP-1 (DGWC-69 and DGWC-68A).
- **Ferric oxide.** Ferric oxide ( $\text{Fe}_2\text{O}_3$ ) is insoluble in water and has a pH of 6-8. Three loadings of Sigma Aldrich ferric oxide (<5  $\mu\text{m}$ , 96%) were evaluated for the precipitation of arsenic and molybdenum in two groundwaters from AP-1 (DGWC-69 and DGWC-68A).
- **Ferrous sulfide.** Ferrous sulfide ( $\text{FeS}$ ) is insoluble in water and has a pH of 9.5-12.5. Three loadings of Sigma Aldrich ferrous sulfide technical grade were evaluated for the precipitation of arsenic and molybdenum in two groundwaters from AP-1 (DGWC-69 and DGWC-68A).

## 2.2 Bench-scale Groundwater Collection

Groundwater samples were collected from the five locations. With 1 L reaction vessels for each treatment, about 5 gallons of each of the five groundwaters were required. The samples were delivered to the TSI under a chain of custody. Samples from DGWC-20, DGWC-48, DGWC-68A, DGWC-19, DGWC-47 and DGWC-69 were delivered to TSI on 1/28/22 and stored in refrigerators. The samples from DGWC-20, DGWC-48, and DGWC-69 were transferred to 1.3-

gallon jugs while purging with nitrogen gas. The sample from AP-1 DCWC-68A was received in 1-gallon jugs. Golder/WSP decided not to test the DGWC-19 and DGWC-47 groundwaters. The groundwater sample from AP-1 DGWC-40 was received on 2/10/22.

### **2.3 Baseline characterization**

At the beginning of the bench-scale treatability test, the baseline characterization was performed to verify contaminant concentrations in the samples. The groundwater samples were homogenized to the extent possible. The homogenized groundwater samples were analyzed for total cobalt, arsenic, molybdenum, beryllium, lithium, selenium, iron, potassium, manganese, magnesium, and sodium (metals chosen based upon site characteristics); dissolved arsenic, beryllium, cobalt, molybdenum, lithium, and selenium (based upon site characteristics); dissolved organic carbon (DOC), and sulfate, by the Eurofins Lancaster Laboratories and for pH, ORP, dissolved oxygen (DO), bicarbonate alkalinity, total hardness, ferrous iron, and sulfide by TSI using calibrated meters and Hach procedures.

### **2.4 Titration Tests**

Alkaline titrations were conducted to determine the potassium bicarbonate and sodium bicarbonate testing dosages. An alkaline titration test was completed to determine the pH resulting from 0, 1, 2, 5, and 10 g/L additions of potassium bicarbonate and sodium bicarbonate reagent dosages. The total suspended solids (TSS) were determined by weighing the 0.2  $\mu\text{m}$  nylon filter before filtering the samples and after filtration and drying in a 105 °C oven. The weight of the TSS collected was divided by the volume of groundwater that passed through the filters.

### **2.5 Reagent Screening**

The purpose of this step was to select the most appropriate reagent for each of the nine groundwater samples.

The reagent dosages were determined from the baseline characterization and titration. For each sample, a total of 12 to 13 reactors were set up for each site. The studies were prepared in an anaerobic chamber with a 92% nitrogen, 5% carbon dioxide, and 3% hydrogen atmosphere to maintain the redox state of the groundwater.

AP-1 (Arsenic and Molybdenum) DGWC-69 and DGWC-68A

- Control
- Potassium Bicarbonate: 3 dosages (2, 5, and 10 g/L)
- Calcium Oxide: 3 dosages (1, 2, and 5 g/L)
- Ferric Oxide: 3 Dosages (0.5, 1.0, and 2.0 g/L)
- Ferrous Sulfide: 3 Dosages (0.5, 1.0, and 2.0 g/L)

AP-1 (Cobalt) DGWC-40

- Control
- Potassium Bicarbonate: 4 dosages (1, 2, 5, and 10 g/L)
- Sodium Bicarbonate: 4 dosages (1, 2, 5, and 10 g/L)
- ZVI: 3 Dosages (0.5, 1.0, and 1.5 g/L)

AP-2 and 3/4 (Arsenic, Beryllium, Cobalt, Lithium, and Selenium) DGWC-48 and DGWC-20

- Control
- Potassium Bicarbonate: 4 dosages (1, 2, 5, and 10 g/L)
- Sodium Bicarbonate: 4 dosages (1, 2, 5, and 10 g/L)
- ZVI: 3 Dosages (0.5, 1.0, and 1.5 g/L)

All containers were mixed and turned periodically for seven days. Groundwater samples (the supernatants in the reactors) were analyzed for:

- total arsenic, beryllium, cobalt, molybdenum, and selenium (based upon contaminants of concern for each site);
- total lithium for DGWC-48 and DGWC-20
- total iron, potassium, manganese, magnesium, and sodium
- dissolved arsenic, beryllium, cobalt, lithium, molybdenum, and selenium (based upon contaminants of concern for each site). The samples were filtered through 0.2  $\mu\text{m}$  nylon filters and the filtrates were divided into bottles for DOC and metals.
- dissolved lithium for DGWC-48 and DGWC-20
- dissolved organic carbon (DOC)
- sulfate

Eurofins Lancaster Laboratories of Lancaster PA conducted the metals, DOC, and sulfate analyses. The pH, ORP, dissolved oxygen (DO), bicarbonate alkalinity, total hardness, ferrous iron, and sulfide were conducted by TSI using calibrated meters and Hach procedures. The estimated sample volumes for the initial characterization, screening, and rebound tests are shown in Table 1. The volumes were adjusted to account for required dilutions and volumes of water available.

### 3.0 AP-1

#### 3.1 AP-1 Initial Characterization Results

Table 2 has the results of the field parameters, Hach tests, metals, DOC, and sulfate results for the three groundwater samples in AP-1.

**AP-1 DGWC-69.** The pH ranged from 6.4 to 7.3 with a moderate bicarbonate alkalinity of 60 mg/L  $\text{CaCO}_3$ . There was a positive ORP (167 mV) and moderately high dissolved oxygen (9.8 mg/L). The TSS was 8.4 mg/L with a hardness 40 mg/L, 0.01 mg/L ferrous iron, and no sulfide. The pH increased from 6.4 to 7.8 SU with 1 g/L sodium bicarbonate and increased to 8.3 with 10 g/L. The pH increased from 7.1 to 8.2 SU with 1 g/L potassium bicarbonate and to 8.4 with 10 g/L. This groundwater has low 6 mg/L sulfate and 1.5 mg/L DOC. Total arsenic was 0.022 mg/L and dissolved arsenic was 0.020 mg/L; both exceeded the GA GWPS. Molybdenum was detected but below 0.006 mg/L and was below the GA GWPS. The groundwater contained 0.13 mg/L total iron, 2.3 mg/L total magnesium, 0.027 mg/L total manganese, 2.4 mg/L potassium, and 9.5 mg/L sodium.

**AP-1 DGWC-68A.** The pH ranged from 6.3 to 6.8 with a moderate bicarbonate alkalinity of 200 mg/L  $\text{CaCO}_3$ . There was a positive ORP (224 mV) and moderately high dissolved oxygen (10.8 mg/L). The TSS was 13.8 mg/L with a hardness 120 mg/L, 0.01 mg/L ferrous iron, and no sulfide. The pH increased from 6.8 to 7.5 SU with 1 g/L sodium bicarbonate and increased to 8.2 with 10 g/L. The pH increased from 6.6 to 7.2 SU with 1 g/L potassium bicarbonate and to 8.2 with 10 g/L. This groundwater has moderate 78 mg/L sulfate and 1.1 mg/L DOC. Total arsenic and

dissolved arsenic not detected. Molybdenum was relatively high with 0.22 g/L total and 0.20 mg/L dissolved; both exceeded the GA GWPS of 0.10 mg/L. The groundwater contained 0.049 mg/L total iron, 18 mg/L total magnesium, 0.096 mg/L total manganese, 3.8 mg/L potassium, and 11 mg/L sodium.

**AP-1 DGWC-40.** The initial pH was 4.8 with a bicarbonate alkalinity of 5 mg/L CaCO<sub>3</sub>. There was a positive ORP (226 mV) and moderate dissolved oxygen (5.5 mg/L). The TSS was 0.8 mg/L with a hardness of 240 mg/L, 0.28 mg/L ferrous iron, and no sulfide. The pH increased from 4.8 to 6.9 SU with 1 g/L sodium bicarbonate and increased to 8.0 with 10 g/L. The pH increased from 4.8 to 6.9 SU with 1 g/L potassium bicarbonate and to 7.9 with 10 g/L. This groundwater has moderate 190 mg/L sulfate and no detectable DOC. Total cobalt was detected at 0.039 mg/L and dissolved cobalt at 0.038 mg/L; both were slightly above the GA GWPS of 0.032 mg/L. The groundwater contained 0.039 mg/L total iron, 19 mg/L total magnesium, 3.4 mg/L total manganese, 6.1 mg/L potassium, and 19 mg/L sodium.

### 3.2 AP-1 Testing Results

**Well DGWC-69 Summary.** Table 3 has the field parameters and ELLE results for this groundwater.

On Day 0, the control pH was 6.6 and increased to 7.7 for the 2 g/L loading of potassium bicarbonate. The highest dosage of 10g/L potassium buffers had a pH of 8.5 on Day 0. On Day 7, the pH for the potassium bicarbonate treatments ranged from 7.8 to 8.4, 11.9 to 12.1 for the calcium oxide treatments, from 7.1 to 8.7 for the iron oxide, and from 6.2 to 6.8 for the ferrous sulfide treatments. The ORPs were positive (except for the CaO treatments where the very high pHs caused negative ORPs) and ranged from -76 to 247 mV. DO ranged from 4.4 to 8.0 mg/L. The total suspended solids ranged from 0 to 2,673 mg/L. The treatments with 5 g/L KHCO<sub>3</sub>, 1-5 g/L CaO, 0.5-2 g/L Fe<sub>2</sub>O<sub>3</sub>, and 0.5-2.0 FeS had elevated TSS. Bicarbonate alkalinity was moderate in the control (35 mg/L as CaCO<sub>3</sub>) and increased with bicarbonate additions. Phenolphthalein alkalinity was very high in the CaO treatments due to the extreme pHs. The hardness ranged from 40 to 1,820 mg/L as CaCO<sub>3</sub>. Only 1 and 2 g/L FeS treatments had a little ferrous iron. Sulfide was low (0.01 to 0.35 mg/L).

Sulfate ranged from 8.4 to 25 mg/L. Little DOC was detected; the higher dosages of buffer had the most, 2.1 and 4.9 mg/L. Total arsenic ranged from 0.0065 to 0.025 mg/L with the following treatments below the GA GWPS: 1 and 2 g/L FeS. Dissolved arsenic ranged from 0.00074 to 0.024 mg/L with the following treatments below the GA GWSP: 1 g/L CaO, 2 g/L CaO, 5 g/L CaO, 0.5 g/L Fe<sub>2</sub>O<sub>3</sub>, 1 g/L Fe<sub>2</sub>O<sub>3</sub>, 2 g/L Fe<sub>2</sub>O<sub>3</sub>, 0.5 g/L FeS, 1.0 g/L FeS, and 2 g/L FeS. Total molybdenum ranged from 0.0034 to 0.010 mg/L; all were below the GA GWPS. Dissolved molybdenum ranged from 0.00017 to 0.0057 mg/L with dissolved molybdenum below the GA GWPS in all treatments. Iron increased in almost all treatments except for the KHCO<sub>3</sub> treatments. Total magnesium did not change much except for the CaO treatments. Total manganese increased in all treatments. Potassium increased with the increasing loadings of potassium bicarbonate. Sodium ranged from 9.1 to 19 mg/L.

The CaO, Fe<sub>2</sub>O<sub>3</sub>, and FeS treatments showed significant reductions in dissolved arsenic with all of these treatments reducing dissolved arsenic below the GA GWPS. The Fe<sub>2</sub>O<sub>3</sub> and the highest dosage of FeS reduced the dissolved molybdenum by more 50% and all treatments including the control were below the GA GWPS for molybdenum of 0.10 mg/L.

**Well DGWC-68A Summary.** Table 4 has the field parameters and ELLE results for this groundwater. On Day 0, the control pH was 6.6 and increased to 7.7 for the 2 g/L loading of potassium bicarbonate. The highest dosage of 10g/L potassium buffers had a pH of 8.5 on Day 7. The pH drifted down slightly over the 7-day incubation period. By Day 7, the pHs ranged from 11.6 to 11.9 for the calcium oxide treatments, from 6.7 to 8.1 for the iron oxide, and from 6.4 to 6.5 for the ferrous sulfide treatments. The ORPS were positive (except for the CaO treatments where the very high pHs caused negative ORPs) and ranged from -38 to 277 mV. DO ranged from 3.5 to 9.1 mg/L. The total suspended solids ranged from 0.9 to 2,530 mg/L. The treatments with 1-5 g/L CaO, 0.5-2 g/L Fe<sub>2</sub>O<sub>3</sub>, and 0.5-2.0 FeS had elevated TSS. Bicarbonate alkalinity was moderate in the control (180 mg/L as CaCO<sub>3</sub>) and increased with bicarbonate additions. Phenolphthalein alkalinity was very high in the CaO treatments due to the extreme pHs. The hardness ranged from 120 to 1,700 mg/L as CaCO<sub>3</sub>. None of the treatments had much ferrous iron. Sulfide was low (0.01 to 0.10 mg/L).

Sulfate ranged from 33 to 54 mg/L. Little DOC was detected; the highest dosage of buffer had the most, 7.8 mg/L. Total arsenic ranged from <0.00068 to 0.0024 mg/L with all treatments below the GA GWPS. Dissolved arsenic was not detected. Total molybdenum ranged from 0.026 to 0.21 mg/L. Dissolved molybdenum ranged from 0.031 to 0.21 mg/L with all measurements higher than the Control Day 0. The following treatments were less than the GA GWPS for dissolved molybdenum on Day 7: 1 g/L Fe<sub>2</sub>O<sub>3</sub>, 2 g/L Fe<sub>2</sub>O<sub>3</sub>, and 2 g/L FeS. Iron increased in almost all treatments except for the KHCO<sub>3</sub> treatments. Total magnesium ranged from 10 to 30 mg/L and was highest in the CaO treatments. Total manganese increased in all treatments. Potassium increased with the increasing loadings of potassium bicarbonate. Sodium ranged from 9.1 to 19 mg/L.

Arsenic was below detection limits except for total arsenic in the 5 g/L CaO and 0.5 to 2.0 g/L Fe<sub>2</sub>O<sub>3</sub> treatments. The higher dosages of Fe<sub>2</sub>O<sub>3</sub> and the highest dosage of FeS reduced the dissolved molybdenum to below the GA GWPS.

**Well DGWC-40 Summary.** Table 5 has the field parameters and ELLE results for this groundwater. The control pH was 4.8 on Day 0 and increased to between 6.8 and 6.9 for the lowest loading of potassium and sodium bicarbonate with the highest dosage of buffers having pHs of 8.0 to 8.1. The pHs were generally slightly lower (-1.1 to 0.5 SU). The pHs in the ZVI treatments ranged from 5.7 to 6.1 SU on Day 7. The ORPS were positive (except for the highest ZVI loading) and ranged from -335 to 256 mV. DO ranged from 1.4 to 5.4 mg/L. There were not much total suspended solids (0 to 8.2 mg/L) except in the treatments with ZVI (likely due to carryover of the ZVI). Bicarbonate alkalinity was low in the control and increased with potassium and sodium bicarbonate additions. The hardness ranged from 180 to 240 mg/L. Only the control (0.14 mg/L) and the ZVI treatments (0.11 to 9.0 mg/L) had much ferrous iron. Sulfide was low (0.02 to 0.17 mg/L).

Sulfate ranged from 210 to 230 mg/L. Little DOC was detected (0.52 to 3.2 mg/L). Total Co ranged from 0.035 to 0.044 mg/L with the GA GWPS of 0.032 mg/L for cobalt. Only the 1.5 g/L ZVI showed 34.2% reduction to below the GA GWPS. Iron increased in almost all treatments from the IC but the most iron was found in the ZVI treatments. Magnesium ranged from 18 to 20 mg/L and manganese from 3.1 to 4.0; neither of these metals were impacted by the bicarbonate or ZVI treatments. Potassium and sodium increased with the increasing loadings of potassium and sodium bicarbonate.

Only the 1.5 g/L ZVI treatment showed removal of dissolved cobalt to below the GA GWPS with a 34.2% reduction.

### 3.3 AP-1 Conclusions

Table 6 summarizes the percent removals from the initial characterization samples or the Control Day 0 for the dissolved metals of concern across the various groundwaters. Compounds highlighted in green were reduced to below the GA GWPS by the treatments.

**Arsenic.** In the AP-1 DGWC-69 all treatments with calcium oxide, ferric oxide, and ferrous sulfide reduced dissolved arsenic to below the GA GWPS but not the potassium bicarbonate treatments. The AP-1 DGWC-68A had no detectable dissolved arsenic.

**Cobalt.** The GA GWPS for cobalt is 0.032 mg/L. Only the 1.5 g/L ZVI treatment reduced dissolved Co in the AP-1 DGWC-40 groundwater to below the GA GWPS.

**Molybdenum.** All of the treatments, including the control, were below the GA GWPS for molybdenum in the DGWC-69 groundwater treatments. Ferrous oxide at 1 and 2 g/L loadings and the highest loading of ferrous sulfide was effective in reducing dissolved Mo in the DGWC-68A groundwater to below the GA GWPS.

**Overall Conclusions.** The calcium oxide, ferric oxide, and ferrous sulfide reduced arsenic to below the GA GWPS in the DGWC-69 groundwater. Only the highest loading of ZVI reduced cobalt in the AP-1 DGWC-40 groundwater to below the GA GWPS. The higher dosages of ferric oxide and ferrous sulfide were effective for dissolved molybdenum in the DGWC-68A groundwater. The AP-1 DGWC-69 groundwater did not have dissolved arsenic above the GA GWPS.

## 4.0 AP-2 and 3/4

### 4.1 AP-2 and 3/4 Initial Characterization Results

Table 7 has the results of the field parameters, Hach tests, metals, DOC, and sulfate results for the two groundwater samples in AP-2 and 3/4.

**Well DGWC-48.** The pH ranged from 4.0 to 4.5 with no bicarbonate alkalinity. There was a positive ORP (338 mV) and moderately high dissolved oxygen (11.2 mg/L). The TSS was 0 mg/L with a hardness 20 mg/L, 2.52 mg/L ferrous iron, and no sulfide. The pH increased from 4.5 to 7.5 SU with 1 g/L sodium bicarbonate and increased to 8.2 with 10 g/L. The pH increased from 4.0 to 7.1 SU with 1 g/L potassium bicarbonate and to 8.2 with 10 g/L. This groundwater has high 520 mg/L sulfate and only 0.97 mg/L DOC. Total arsenic and dissolved arsenic were non-detect. Beryllium ranged from 0.0079 to 0.0086 mg/L which were above the GA GWPS. Cobalt was found at 0.33 to 0.35 mg/L above the GA GWPS of 0.032 mg/L. Lithium was found at 0.10 to 0.11 mg/L above the GA GWPS of 0.040 mg/L. No selenium was detected. The groundwater contained 3.9 mg/L total iron, 16 mg/L total magnesium, 13 mg/L total manganese, 14 mg/L potassium, and 23 mg/L sodium.

**Well DGWC-20.** The pH ranged from 4.4 to 5.0 with little bicarbonate alkalinity of <5 mg/L CaCO<sub>3</sub>. There was a positive ORP (423 mV) and moderately high dissolved oxygen (9.6 mg/L). The TSS was 6.6 mg/L with no hardness, 0.07 mg/L ferrous iron, and no sulfide. The pH increased from 5.0 to 7.3 SU with 1 g/L sodium bicarbonate and increased to 8.1 with 10 g/L. The pH increased from 4.5 to 7.0 SU with 1 g/L potassium bicarbonate and to 8.1 with 10 g/L. This

groundwater has moderate 190 mg/L sulfate and no detectable DOC. Total cobalt was detected at 0.039 mg/L and dissolved cobalt at 0.038 mg/L. The groundwater was slightly hard with 0.039 mg/L total iron, 19 mg/L total magnesium, 3.4 mg/L total manganese, 6.1 mg/L potassium, and 19 mg/L sodium. has high 490 mg/L sulfate and only 0.71 mg/L DOC. Total arsenic and dissolved arsenic were 0.014 to 0.016 mg/L; above the GA GWPS. Beryllium ranged from 0.0073 to 0.0083 mg/L ; above the GA GWPS. Cobalt was found at 0.96 to 1.0 mg/L; above the GA GWPS. Lithium and selenium were not detected. The groundwater contained 0.12 mg/L total iron, 26 mg/L total magnesium, 42 mg/L total manganese, 14 mg/L potassium, and 24 mg/L sodium.

#### **4.2 AP-2 and 3/4 Testing Results**

**Well DGWC-48 Summary.** Table 8 has the field parameters and ELLE results for this groundwater. On Day 0, the control pH was 4.2 and increased to 6.9 for the lowest 1 g/L loading of potassium bicarbonate and to 7.1 for the lowest 1 g/L loading of sodium bicarbonate. The highest dosage of buffers had pHs of 7.9-8.0 on Day 7. The pH in the ZVI treatments on Day 7 ranged 5.0 to 6.4 SU. The ORPS on Day 7 were positive and ranged from 59 to 351 mV. DO ranged from 3.4 to 8.8 mg/L. The total suspended solids ranged from 11 to 150 mg/L. The treatments with 10 g/L KHCO<sub>3</sub>, 10 g/L NaHCO<sub>3</sub> and ZVI had elevated TSS. Bicarbonate alkalinity was low in the control and ZVI treatments (5-10 mg/L CaCO<sub>3</sub>) and increased with bicarbonate additions. The hardness ranged from <20 to 220 mg/L with higher readings at the higher buffer loadings. Only control, 10 g/L sodium bicarbonate and the ZVI treatments had more than 0.15 mg/L ferrous iron. Sulfide was low (0.02 to 0.09 mg/L).

Sulfate ranged from 330 to 400 mg/L. Little DOC was detected (0.79 to 11 mg/L); the highest dosage of buffer had the most, 9.0 and 11 mg/L. Total and dissolved arsenic were not detected except total arsenic in the treatments with ZVI; dissolved As were well below the GA GWPS in all treatments. Total beryllium ranged from 0.0050 to 0.0073 mg/L; all samples were above the GA GWPS of 0.004 mg/L. Dissolved beryllium ranged from 0.00085 to 0.0071 mg/L with only the Control and ZVI treatments exceeding the GA GWPS. Total cobalt was moderate ranging from 0.17 to 0.34 mg/L. The following treatments showed more than 50% reductions in dissolved Co: 10 g/L KHCO<sub>3</sub> and 10 g/L NaHCO<sub>3</sub> with the no treatments decreasing the cobalt concentrations to below the GA GWPS. Total lithium ranged from 0.11 to 0.12 mg/L and dissolved lithium from 0.099 to 0.13 mg/L. None of the treatments reduced dissolved Li below the GA GWPS. Selenate and selenite were spiked into the AP-2 and 3/4 DGWC-48 groundwater. On Day 7, total Se ranged from 0.17 to 0.52 mg/L and dissolved selenium of 0.14 to 0.46 mg/L. No treatment reached the GA GWPS of 0.050 mg/L. Iron decreased in almost all treatments from the IC except for the ZVI treatments. Total magnesium did not change much ranging from 15 to 16 mg/L. Total manganese ranged from 5.3 to 14 mg/L and was reduced by >50% only in the 10 g/L NaHCO<sub>3</sub> treatments. Potassium and sodium increased with the increasing loadings of potassium and sodium bicarbonate.,

The 1-10 g/L of both the potassium and sodium bicarbonate treatments showed significant (>50%) reductions in dissolved beryllium to below the GA GWPS. No treatment resulted in decreases in dissolved cobalt to below the GA GWPS. None of the treatments reduced the dissolved lithium to below the GA GWPS. Only the highest loading of 1.5 g/L ZVI removed more than 50% of the dissolved selenium from the spiked Control, but no treatment reached the GA GWPS for dissolved selenium. Arsenic was below the GA GWPS in all treatments.

**Well DGWC-20 Summary.** Table 9 has the field parameters and ELLE results for this groundwater. The total cobalt, selenium, iron, magnesium, manganese, potassium, and sodium in

the 2 g/L  $\text{KHCO}_3$  treatment are low with the dissolved cobalt and selenium being considerably higher. The 5 and 10 g/L  $\text{KHCO}_3$  treatments were reanalyzed and the tables have been updated.

The control pH at Day 0 was 4.5 SU and increased to 6.8 for the lowest loading of potassium bicarbonate and to 7.7 for the lowest loading of sodium bicarbonate. The highest dosage of buffers had pHs of 7.6-7.7 on Day 7. The ORPS were positive and ranged from 163 to 297 mV. DO ranged from 6.7 to 7.8 mg/L. The total suspended solids ranged from 2.6 to 460 mg/L. The treatments with 10 g/L  $\text{KHCO}_3$ , 5 g/L  $\text{NaHCO}_3$ , 10 g/L  $\text{NaHCO}_3$  and 1.5 g/L ZVI had elevated TSS above 100 mg/L. Bicarbonate alkalinity was low in the control and increased with bicarbonate additions. The hardness ranged from <20 to 460 mg/L. Little ferrous iron was detected (0.03 to 0.45 mg/L). Sulfide was low (0 to 0.02 mg/L).

Sulfate ranged from 480 to 600 mg/L. Little DOC was detected; the highest dosage of buffer had the most, 4.8 and 10 mg/L. Total arsenic ranged from <0.00068 to 0.036 mg/L with the 2 g/L  $\text{KHCO}_3$  treatment having no detectable arsenic. Dissolved arsenic ranged from <0.00070 to 0.019 mg/L with the 1, 2, 5, and 10 g/L  $\text{KHCO}_3$ , and 1 and 2 g/L  $\text{NaHCO}_3$  treatments having no detectable dissolved arsenic and the 5 and 10 g/L  $\text{NaHCO}_3$  treatments also having dissolved arsenic below the GA GWPS. Total beryllium ranged from <0.00012 to 0.0011 mg/L; the 2 g/L  $\text{KHCO}_3$  treatment was below the GA GWPS. Dissolved beryllium ranged from 0.00022 to 0.0099 mg/L with all  $\text{KHCO}_3$  and  $\text{NaHCO}_3$  treatments below the GA GWPS. Total cobalt was moderate and ranged from <0.00016 to 1.1 mg/L but none of the treatments reached the GA GWPS. The following treatments showed more than 50% reductions in dissolved Co: 5 g/L  $\text{KHCO}_3$ , 10 g/L  $\text{KHCO}_3$ , 5 g/L  $\text{NaHCO}_3$ , and 10 g/L  $\text{NaHCO}_3$  but none met the GA GWPS. Total lithium was not detected. Dissolved Li ranged from 0.014 to 0.023 mg/L in the  $\text{KHCO}_3$  and  $\text{NaHCO}_3$  treatments and were higher than the control. Lithium was below the GA GWPS in all treatments. Selenate and selenite were spiked into the AP-2 and 3/4 DGWC-20 groundwater. Total Se ranged from <0.00028 to 0.50 mg/L and dissolved Se from 0.22 to 0.49 mg/L. Only the 2 g/L  $\text{KHCO}_3$  treatment met the GA GWPS for selenium. No treatments reduced the dissolved Se to the GA GWPS however the ZVI treatments did show lower dissolved Se to 0.26 to 0.30 mg/L. Total iron increased in many treatments especially for the ZVI treatments. Total magnesium did not change much except for the 2 g/L  $\text{KHCO}_3$  treatment. Total manganese was reduced by >50% in the 2 g/L  $\text{KHCO}_3$ , 5 g/L  $\text{KHCO}_3$ , 5 g/L  $\text{NaHCO}_3$ , and 10 g/L  $\text{NaHCO}_3$  treatments. Potassium and sodium increased with the increasing loadings of potassium and sodium bicarbonate.,

The 1-10 g/L of both the potassium and sodium bicarbonate treatments showed significant reductions in dissolved arsenic and dissolved beryllium. The higher dosages of 5-10 g/L  $\text{KHCO}_3$  and 5-10 g/L  $\text{NaHCO}_3$  reduced the dissolved cobalt by more than 50% but not to below the GA GWPS. Total lithium was not detected and dissolved lithium was low. Only the ZVI treatments seemed to impact the dissolved selenium and then by only 25 to 35% reductions with no treatment reaching the GA GWPS.

#### 4.3 AP-2 and 3/4 Conclusions

Table 10 summarizes the percent removals from the initial characterization samples or the Control Day 0 for the dissolved metals of concern across the various treatments and groundwaters. Compounds highlighted in green were reduced to below the GA GWPS by the treatments. Compounds highlighted in yellow were reduced by more than 50%. Lithium was not detected in the AP-2 and 3/4 DGWC-20 IC groundwater; the percent removals highlighted in gray were based upon the dissolved lithium detection limit in the IC samples.

**Arsenic.** Dissolved As was not detected in AP-2 and 3/4 well DGWC-48. Dissolved As in well DGWC-20 was reduced to below the GA GWPS in all potassium and sodium bicarbonate treatments.

**Beryllium.** In the AP-2 and 3/4 DGWC-48 and 20 groundwaters, all potassium and sodium bicarbonate levels reduced dissolved Be to below the GA GWPS but the ZVI treatments did not.

**Cobalt.** The GA GWPS for cobalt is 0.032 mg/L. No treatment reduced the dissolved cobalt to below the GA GWPS in either the AP234 DGWC-48 or DGWC-20 groundwaters.

**Lithium.** None of the treatments were effective against dissolved lithium in the AP-2 and 3/4 DGWC-48 groundwater. There were only trace levels of dissolved lithium in the AP-2 and 3/4 DGWC-20 groundwater.

**Selenium.** Selenium was not detected in either the AP-2 and 3/4 DGWC-48 or DGWC-20 initial characterization samples. These groundwaters were spiked with a mixture of sodium selenite ( $\text{Se}^{4+}$ ) and sodium selenate ( $\text{Se}^{6+}$ ) to concentrations of 0.32 to 0.40. mg/L. None of the treatments reduced dissolved Se to below the GA GWPS. Only the highest (1.5 g/L) ZVI reduced dissolved Se from the Control 0 by more than 50% in the AP-2 and 3/4 DGWC-48 groundwater and no treatment reached the 50% threshold in the AP-2 and 3/4 DGWC-20 groundwater.

**Overall Conclusions.** Addition of relatively high dosages of potassium or sodium bicarbonate buffers were generally able to reach the GA GWPS for arsenic and beryllium and reduce cobalt. Lithium was not effectively treated in the AP-2 and 3/4 DGWC-48 groundwaters. Only the highest dosage of ZVI appeared to reduce selenium by more than 50% in one of the two groundwaters with selenium and no treatment reached the GA GWPS of 0.050 mg/L.

Please let me know if you have any questions about this final report.

Sincerely,

## Certification

This *Alternate Source Demonstration for Combined Radium*, Georgia Power Company Plant McDonough-Atkinson, Ash Pond 2 and 3/4, has been prepared in compliance with applicable United States Environmental Protection Agency (USEPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015) and Georgia Environmental Protection Division Rule 391-3-4-.10(6)(a-c) under the direction of a licensed professional engineer with Golder Associates USA Inc.

I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g) and that this Alternate Source Demonstration for Radium 226+228 has been prepared to meet the requirements of 40 CFR §257.95(g)(3)(ii) and Georgia Environmental Protection Division Rule 391-3-4-.10(6)(a-c).

### Golder Associates USA Inc.

Dawn L. Prell, CPG  
*Senior Hydrogeologist*

I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g) and that this Alternate Source Demonstration, Georgia Power Company Plant McDonough-Atkinson, located at 5551 S. Cobb Drive, Smyrna, Georgia, has been prepared to meet the requirements of 40 CFR §257.95(g)(3)(ii).

Todd Rees, PhD, PE  
Georgia Registered Professional Engineer No. 047845

## 1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (US EPA) coal combustion residual (CCR) rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR 21302-21501, April 17, 2015) (CCR Rule or The Rule), this Alternate Source Demonstration (ASD), Plant McDonough Ash Pond 2 and Ash Pond 3/4 (AP-2 and 3/4) has been prepared to document an alternate source for Statistically Significant Levels (SSLs) of combined radium (radium 226 + 228) identified at Georgia Power Company's Plant McDonough AP-2 and 3/4 (Site) during assessment monitoring. An SSL for combined radium at assessment monitoring well B-104D was reported in the recent (2021) Semi-Annual Monitoring and Corrective Action Report submitted to Georgia (GA) Environmental Protection Division (EPD) on February 28, 2022.

This document satisfies the requirements of § 257.95(g)(3)(ii) and § 391-3-4-.14(23)(c) which allows the owner or operator within 90 days to demonstrate that a source other than the CCR Unit has caused an SSL. In addition to the SSL at B-104D, reported concentrations at B-109D, B-111D and B-115D for combined radium are greater than the GWPS; however, an SSL has not yet been identified since the wells have not yet been sampled four times.

This ASD presents the results of an investigation performed to evaluate the presence of naturally occurring radionuclides, present throughout the region and sitewide in the rock materials underlying AP-1 and AP-2, 3/4 at Plant McDonough. Multiple lines of evidence supporting this demonstration are as follows:

- Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- Combined radium concentrations in groundwater samples collected from the deep delineation wells have decreased since well installation.
- The wells with elevated radium concentrations show low levels of CCR indicator parameters.
- Naturally occurring parent elements have been identified in bedrock samples collected from the screened intervals of the deep/bedrock delineation wells.
- Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.

## 2.0 SITE DESCRIPTION AND BACKGROUND

Plant McDonough, a natural gas power plant converted in 2012 from a coal-fired power plant, is located in southeast Cobb County, Georgia near the Fulton County line, and is owned and operated by the Georgia Power Company. The Plant is located approximately 7 miles northwest of Atlanta, Georgia, and is surrounded primarily by industrial and residential land use. The property occupies approximately 390 acres and is bounded on the southeast by the Chattahoochee River. The Plant owns a small portion of land south of the river. Figure 1 presents the location of Plant McDonough relative to local topography and surrounding features. Figure 2 shows the location of on-site monitoring wells and piezometers. Figure 3 presents a lithological cross-section through the deeper bedrock wells.

### 2.1 Geological Setting

The Site is situated in the Piedmont province, in a regional zone of geologic deformation, referred to as the Brevard Zone, that extends from Alabama to Virginia. The plant property northwest of the faulted contact is

underlain by the Long Island Creek Gneiss, which is a medium- to coarse-grained felsic rock. Near faults and shear zones, the gneiss is locally intruded by another felsic rock, i.e., granitic pegmatites (borehole logs indicating the presence of pegmatites at the Site are presented in Appendix A). Pegmatites are coarse-grained igneous rocks formed in the late stage of magma crystallization and noted for their high textural and compositional variability and enrichment of trace elements such as uranium, thorium, rare-earth elements, etc. (Adams et al. 1980). Numerous studies (as detailed in Section 5.0) have evaluated the presence of the radionuclides radium, uranium, and thorium in aquifer solids and groundwater in principal aquifers in the US and abroad (e.g., Chapman et al. 2013; Ranger 1995; Rosson et al. 1991; Szabo et al. 2012; Stackelberg et al. 2018; Vinson et al. 2013) and specifically in Georgia, granite and gneiss aquifers in the Piedmont were identified to have the highest concentrations of naturally occurring radionuclides (Coker and Olive 1989).

Uranium and thorium are naturally occurring in the soils, rock, and groundwater of the aquifers in the U.S. at varying levels and decay to form radium (Hem 1990; Langmuir 1994; Nolan et al. 2021). Felsic rock types, i.e., rock types containing abundant silicate minerals such as feldspar and quartz, are naturally enriched in uranium and thorium, the parent elements of radium. For reference, average uranium and thorium concentrations in the earth's crust are 3 and 10 milligrams per kilogram (mg/kg). In basalt (a mafic rock) uranium and thorium average 0.6 and 2.2 mg/kg, respectively, and in granite (a felsic rock) 4.8 and 17 mg/kg, respectively (Smith and Huyck 1999). Concentrations of daughter elements such as radium show a similar distribution between the various material types.

## 2.2 Hydrogeological Setting

A regional, unconfined surficial aquifer system is present at the Site, existing within the overburden and weathered and fractured upper bedrock (i.e., approximately the first 30 feet), depending on topographic location. Recharge primarily occurs through precipitation and subsequent infiltration. Generally, groundwater flow occurs through intergranular pore spaces in the overburden and is controlled by topography and top of rock variations. However, a relatively higher transmissive zone is interpreted to occur at the base of the overburden, at the interface of weathered bedrock and competent bedrock and is believed to be the primary groundwater flow path.

A limited and localized bedrock aquifer system also occurs beneath the Site. The upper bedrock is fractured and weathered, connected hydraulically with the overburden groundwater, and is considered part of the uppermost aquifer. The overlying silt/clay-rich overburden may act to retard recharge into the bedrock aquifer system. However, deeper bedrock (i.e., approximately greater than 30 feet into the bedrock) is unweathered with few discontinuities (e.g., fractures) available to store groundwater.

## 3.0 STATISTICAL ANALYSES METHODS

The monitoring well networks at both groundwater monitoring units (AP-1, and AP-2 and 3/4) at Plant McDonough are in assessment monitoring and are currently performing an assessment of corrective measures for groundwater impacts at the site. During assessment monitoring, concentrations of Appendix IV constituents are compared to an applicable GWPS. As specified in 40 CFR §257.95(h), the GWPS is the Maximum Contaminant Level (MCL) or the background concentration for constituents for which an MCL has not been established. Because site-specific background for combined radium (5.61 pCi/L) is greater than the MCL (5 pCi/L), the GWPS at the Site is the site background of 5.61 pCi/L.

### 3.1 Statistically Significant Levels

Review of the statistical analysis results indicates that using the GWPS established according to both 40 CFR §257.95(h) and 391-3-4-.10(6)(a), an SSL for combined radium was identified at B-104D. A notice of SSL exceedances was placed in the operating record and submitted to EPD on January 31, 2022. Several additional wells summarized in Table 1 also have concentrations of combined radium above the established GWPS; however, an SSL has not been identified to date. These wells were installed for delineation of inorganic constituents and do not have sufficient data to perform statistical analyses at this time.

**Table 1. Plant McDonough Ash Pond Elevated Combined Radium Concentrations**

Appendix IV Parameter	Plant McDonough Ash Pond Monitoring Well	Result <sup>[1]</sup> (pCi/L)	GWPS (pCi/L)
Combined Radium	B-104D	9.6 - 17.0	5.61
Combined Radium	B-109D	11.8 – 12.1	5.61
Combined Radium	B-111D	4.39 - 12.3	5.61
Combined Radium	B-115D	11.9 - 14.7	5.61

[1] Between two and four samples are available for each of the identified monitoring wells. The range of concentration is given.

### 4.0 CHARACTERIZATION OF AQUIFER MATERIALS

Aquifer solids were retrieved from cores originally collected during monitoring well installation in December 2020 through April 2021. The aquifer materials were analyzed by Pace Analytical Services, LLC for radium parent elements uranium and thorium as well as radium, using EPA Method 901.1: Gamma Emitting Radionuclides in Drinking Water. The analytical results are attached as Appendix B and presented in Table 3 in Section 5.4. The isotopes for the elements tested included:

- Uranium: U-235 and U-238
- Radium: Ra-226 and Ra-228
- Thorium: Th-232 and Th-234.

### 5.0 ALTERNATE SOURCE DEMONSTRATION

Multiple lines of evidence support the conclusion that the reported concentrations of combined radium in groundwater in deep/bedrock delineation wells B-104D, B-109D, B-111D, and B-115D at the Site are not the result of a release from the CCR Unit but rather are naturally occurring due to decay of uranium and thorium from the aquifer solids (i.e., bedrock) and is regionally present. This demonstration is based on the following lines of evidence that strongly support the natural occurrence of radium in groundwater at the Site:

- 1) Groundwater samples from the shallow detection monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- 2) Combined radium concentrations in groundwater samples collected from the deep delineation wells have decreased since well installation.
- 3) The wells with elevated radium concentrations show no correlation with CCR indicator parameters.

- 4) Naturally occurring parent elements have been identified in bedrock samples collected from the screened intervals of the deep/bedrock delineation wells.
- 5) Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.

Each of these lines of evidence is supported by geochemical characterization of aquifer solids, analysis of groundwater samples and review of published data, as discussed in detail in the sections that follow.

**1) Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.**

The combined radium concentrations in samples from shallow wells at the waste boundary located immediately adjacent to the delineation wells with elevated combined radium concentrations, range from 1.15 to 2.36 pCi/L (Table 2). For comparison, combined radium concentrations in samples from the deeper bedrock wells with SSLs and/or elevated combined radium concentrations range from 4.39 to 17.0 pCi/L (Table 1). In each case, the shallow monitoring well is screened in the uppermost unconfined aquifer, in closer proximity to the Ash Ponds, than the deeper delineation wells at which the elevated combined radium concentrations were noted. Site wide, no detection monitoring network well has reported a combined radium SSL since the start of monitoring in 2016. Only the deep vertical delineation wells screened in bedrock, which were installed to delineate constituents other than combined radium, have shown SSLs for combined radium. Additionally, the paired wells groundwater elevations reflect a vertically downward gradient (Figure 4), which indicates groundwater movement from shallow to deeper groundwater zones, further supporting that the elevated combined radium concentrations at the deep delineation wells are not a result of a release from the Ash Ponds.

**Table 2: Combined Radium Concentrations at Shallow Wells Adjacent to Deep Delineation Wells Where Elevated Combined Radium Concentrations are Noted**

Deep Well	Nearest Shallow Detection Monitoring Well	Sample Date	Combined Radium Results (pCi/L)
B-104D	DGWC-48	09/10/2021	2.21
B-109D	DGWC-2	09/09/2021	1.22U
B-111D	DGWC-5	09/10/2021	1.15
B-115D	B-57	01/15/2021	2.36

**2) Combined radium concentrations in groundwater samples collected from the deep delineation wells have decreased since well installation.**

Groundwater with a long residence time in a rock matrix can develop relatively high concentrations of radionuclides due to decay of parent elements. With continued extraction of that water, radionuclide concentrations tend to decline as the formation of the daughter elements cannot ‘keep up’ with further groundwater extraction. This is generally consistent with the elevated measurements in the first samples collected immediately after well installation, followed by a decline in concentrations upon subsequent sampling events. Combined radium concentrations at each of the four wells described above (B-104D, B-109D, B-111D, and B-115D) have exhibited considerable decline in concentration since the initial sampling (Figure 5). In the case of well B-111D, the combined radium concentration was below the GWPS for the Site during the most recent

sampling event (9/14/2021) at 4.39 pCi/L. Should the aquifer conditions change or become more stagnant, radium concentrations may gradually increase again due to the ongoing natural uranium and thorium decay. Based on this key line of evidence, the combined radium observed in groundwater at the deep delineation wells is due to residence time in the rock matrix and not due to release from the Ash Ponds.

### **3) The wells with elevated radium concentrations show no correlation with CCR indicator parameters.**

The concentrations of typical CCR associated parameters, such as boron, are low (<0.69 mg/L) in the deep delineation wells; concentrations are more than three times lower than the average concentration at shallower monitoring wells (Figure 3; Golder 2022). Historically, the deep delineation wells also have reported, on average, lower total dissolved solids (TDS) and sulfate concentrations, indicating no apparent CCR influence. Exceptions are a slightly higher TDS and sulfate concentration noted at B-104D, but like all other deep wells, groundwater in B-104D is calculated to remain undersaturated with respect to sulfate minerals such as gypsum. Well B-104D also reports lower boron and much higher combined radium concentrations as compared to the shallow adjacent well DGWC-48. Thus, the observed geochemical variability in TDS and sulfate concentrations in groundwater is related to water rock interactions in the heterogeneous subsurface lithological composition.

Since 2016, the observed groundwater pH in site-wide (shallow and deep) groundwater at Plant McDonough has ranged from 3.8 to 8.6 and the oxidation reduction potential (ORP) from -112 to +592 millivolt's (mV), respectively. Under these conditions, boron and sulfate are conservative tracers of CCR or the Ash Ponds, with very low to low partitioning coefficients of 0.0 L/kg (boron) and 0.19 to 1.3 L/kg (sulfate; depending on sorbent content; Strenge and Peterson 1989). Generally, dissolved oxygen (DO) and ORP are lower in the deep delineation wells (except DO at B-109D; however, the ORP was still reducing (-83.2 mV), and DO values at prior and subsequent sampling events were low (i.e., <0.65 mg/L), indicating a likely field measurement error during the September 2021 sampling campaign. This is further supported by the January 2022 sampling event where DO at B-109D was reported at 0.28 mg/L. Field sample forms presenting this field data are included in Appendix C.

In contrast, radium in groundwater forms a charged divalent cation ( $Ra^{+2}$ ) which has been shown to effectively adsorb on metal hydroxides at a groundwater pH range of 4 to 10 and also co-precipitate readily with minerals such as barite (Sajih et al. 2014). For a groundwater pH range of 5 to 9, the partitioning coefficient of radium is between 24.3 to 124.0 L/kg depending on sorbent content, indicating radium will not act conservatively in typical groundwater systems (Strenge and Peterson 1989). Therefore, it is geochemically improbable for radium to travel from an Ash Pond to a deep delineation well without being accompanied by the conservative CCR tracers such as boron and sulfate. It should also be noted that elevated radium levels in the deep wells due to a release from the CCR Unit are unlikely to occur without corresponding elevated levels in the adjacent shallow wells. As described above, no radium SSLs have been noted in overburden wells at the site throughout the monitoring history.

### **4) Naturally occurring parent elements have been identified in bedrock samples collected from the screened intervals of the deep/bedrock delineation wells.**

Elevated groundwater concentrations of decay products such as radium typically are related to elevated concentrations of parent elements in associated aquifer solids. Total uranium and thorium concentrations at the four deep bedrock aquifer samples taken from site range from 0.263 to 46.2 mg/kg and non-detect (<138) to 375 mg/kg, respectively (Table 3). The concentrations of uranium in two of the four samples and thorium in all four samples are well above the average crustal rock concentrations of 3 and 10 mg/kg, respectively, and also above the average concentrations in granitic rocks, which are naturally elevated in uranium (17 mg/kg) and thorium (4.8 mg/kg) relative to many other rock types, as reported in a compilation of crustal rock concentrations by Smith and

Huyck (1999). As such, the parent elements for radium are present at elevated levels in Site samples (and in the region, based on literature in line of evidence #5) relative to average concentrations for crustal and felsic rocks, demonstrating the presence of a natural source for radium at the Site.

**Table 3. Occurrence of Total Uranium, Thorium and Radium in Core Samples <sup>1</sup>**

Well ID <sup>2</sup>	Core Depth (ft)	Total Radium (mg/kg)	Total Uranium (mg/kg)	Total Thorium (mg/kg)
B-104D	56.5-57'	2.10 x10 <sup>-06</sup>	46.2	282
B-109D	92.5-93'	1.07 x10 <sup>-06</sup>	15.7	<138 <sup>3</sup>

<sup>2</sup>Note: Core samples collected from screened intervals at each of the identified locations

<sup>3</sup>Note: Minimum Detectable Concentration (MDC) estimated for thorium based on the activity method blank.

**5) Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.**

As noted in Section 2.1, numerous studies have evaluated the presence of the radionuclides radium, uranium, and thorium in aquifer solids and groundwater in principal aquifers in the US and abroad (e.g., Chapman et al. 2013; Ranger 1995; Rosson et al. 1991; Szabo et al. 2012; Stackelberg et al. 2018; Vinson et al. 2013). Highlights of several of these papers are presented in the next paragraphs.

In Rosson et al. (1991), the authors showed evaluated radium and uranium levels in public water systems in Georgia. They concluded that the observed radium and uranium levels in public water systems were related to geologic conditions, with the highest levels occurring in groundwater from the Piedmont physiographic region. Albertson (2003) also found that out of 955 samples from public water supplies in the Piedmont, Blue Ridge, and Coastal Plains physiographic provinces, regionally, 476 (49.8%) samples had a combined radium level greater than 5 pCi/L, demonstrating widespread natural occurrence of radium in groundwater above the MCL<sup>1</sup> (Figure 6). Specifically, in Georgia, granite and gneiss aquifers in the Piedmont were identified to have the highest concentrations of naturally occurring radionuclides of any other aquifer types in the state (Coker and Olive 1989).

Radon, a gas byproduct of radium decay, is prevalent in the greater Atlanta area (Ranger 1995). Granites and faulted areas of high metamorphism produced the highest levels of radon in homes, with gneisses of granitic origin being of particular concern. This includes the Brevard Zone, the regional geologic zone in which Plant McDonough is located.

Szabo et al. (2012) concluded that radium concentrations in groundwater were controlled by the geochemical properties of the 15 major aquifer systems they studied, with highest radium levels occurring when radium adsorption was less effective. The Piedmont region was again identified as one where natural exceedances of the radium MCL occur.

<sup>1</sup> The Cobb County, Georgia, samples included in Albertson (2003) consisted of surface water samples only. As such, this study represents a regional analysis of the Piedmont, without a specific focus on Cobb County.

In summary, there is ample supporting evidence for the presence of naturally occurring parent elements in regional aquifers in the Site area, the presence of elevated levels of radium in regional groundwater, and the presence of radon, a decay product of radium. Thus, there are multiple lines of evidence for naturally-occurring radium in the regional granitic gneiss and this is also confirmed through testing of the site-specific rock formations. As such, combined radium represents a natural occurrence in the groundwater at Plant McDonough.

## 6.0 CONCLUSIONS

This ASD has been prepared pursuant to 40 CFR § 257.95(g)(3)(ii) and § 391-3-4-.10(6)(a-c), to address the SSLs of combined radium observed in monitoring well B-104D, and concentrations exceeding the MCL in wells B-109D, B-111D, and B-115D at Plant McDonough. Based on the key lines of evidence established in this ASD, the combined radium SSLs at the Site are the result of natural occurring radium in the bedrock and groundwater and not the result of a release from the Ash Pond. Lines of evidence supporting this demonstration include:

- Groundwater results for the shallow monitoring wells adjacent to the deep delineation wells have never reported a combined radium SSL, nor have any other shallow monitoring wells at the Site.
- Combined radium concentrations in groundwater samples collected from the deep delineation wells have decreased since well installation.
- The wells with elevated radium concentrations show no correlation with CCR indicator parameters.
- Naturally occurring parent elements have been identified in bedrock samples collected from the screened intervals of the deep/bedrock delineation wells.
- Radionuclides are known to be present in regional aquifer materials and regional groundwater, based on multiple sources/references.

The combined radium GWPS exceedances and elevated concentrations only occurred when deep delineation wells were screened in bedrock. Installation of these delineation wells was not conducted to investigate radium because no on-site wells, including shallow monitoring wells closer in proximity to the Ash Ponds than the deeper wells, have ever reported an SSL for combined radium. Based on the key lines of evidence presented in this ASD, the combined radium concentrations at B-104D, B-109D, B-111D, and B-115D are the result of the radionuclide-rich bedrock in which the wells are screened and not due to a release from the Ash Ponds. This demonstration represents a site-wide natural occurrence of radium and is not specific to the wells identified.

RE: Project: PLANT MCDONOUGH AP-1  
Pace Project No.: 92532118

Dear Joju Abraham:

Enclosed are the analytical results for sample(s) received by the laboratory on April 08, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace Analytical Services - Greensburg

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Kevin Herring

## QUALIFIERS

Project: PLANT MCDONOUGH AP-1

Pace Project No.: 92532118

---

### DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

Acid preservation may not be appropriate for 2 Chloroethylvinyl ether.

A separate vial preserved to a pH of 4-5 is recommended in SW846 Chapter 4 for the analysis of Acrolein and Acrylonitrile by EPA Method 8260.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Act - Activity

Unc - Uncertainty: SDWA = 1.96 sigma count uncertainty, all other matrices = Expanded Uncertainty (95% confidence interval).

Gamma Spec = Expanded Uncertainty (95.4% Confidence Interval)

(MDC) - Minimum Detectable Concentration

Trac - Tracer Recovery (%)

Carr - Carrier Recovery (%)

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

### ANALYTE QUALIFIERS

Ra The reported Ra-226 results were determined by hermetically sealing the dried, processed sample in an appropriate-sized can. Each sample was stored for a minimum of 21 days to ensure that equilibrium between Ra-226 and daughters Bi-214 and Pb-214 was achieved. Reported Ra-226 results were inferred from gamma peaks attributable to Bi-214 and Pb-214.

Project Name Plant McDonough  
Site Name Plant McDonough  
Latitude 0° 0' 0"  
Longitude 0° 0' 0"  
Sonde SN 646770  
Turbidity Make/Model LaMotte 2020we

Pump Information:

Pump Model/Type Waterra  
Tubing Type polyethylene  
Tubing Diameter 0.5 in  
Tubing Length 53 ft

Pump placement from TOC 53 ft

Well Information:

Well ID B-57  
Well diameter 2 in  
Well Total Depth 53.74 ft  
Screen Length 10 ft  
Depth to Water 18.08 ft

Pumping Information:

Final Pumping Rate 1136 mL/min  
Total System Volume 2.136379 L  
Calculated Sample Rate 300 sec  
Stabilization Drawdown 158.64 in  
Total Volume Pumped 226 L
