Prediction Limit

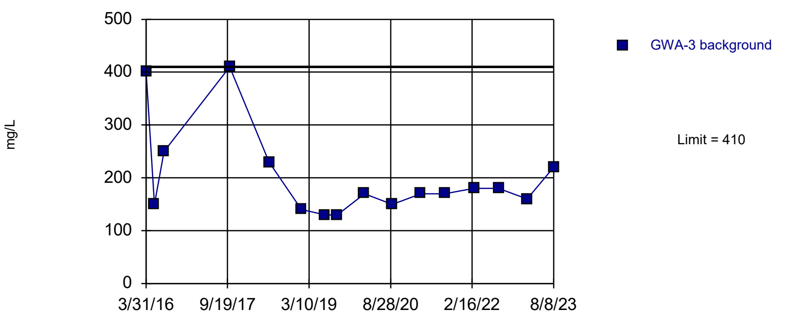
Intrawell Non-parametric, GWA-3 (bg)



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.05 alpha level. Limit is highest of 16 background values. Well-constituent pair annual alpha = 0.01287. Individual comparison alpha = 0.006456 (1 of 2). Assumes 1 future value.

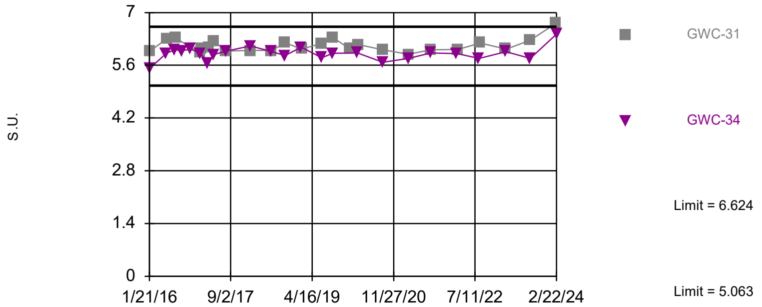
Sanitas™ v.10.0.16 . UG

Exceeds Limits: GWC-31

Prediction Limit

Interwell Parametric



Background Data Summary: Mean=5.844, Std. Dev.=0.3568, n=136. Normality test: Chi Squared @alpha = 0.01, calculated = 11.21, critical = 14.07. Kappa = 2.187 (c=7, w=29, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0001297. Comparing 2 points to limit. Assumes 27 future values.

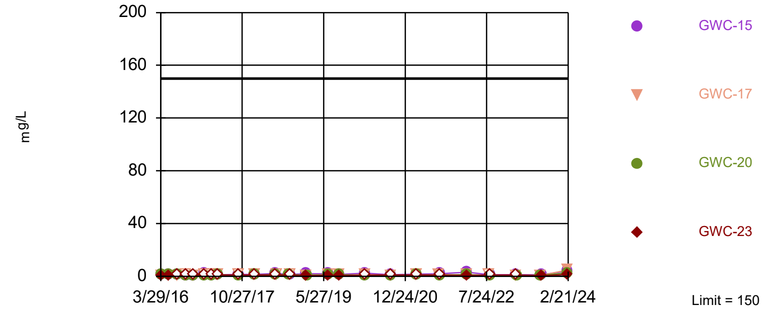
Constituent: pH, Field Analysis Run 4/12/2024 12:04 PM View: Appendix III - Two-Step
Plant Wansley Data: Wansley Landfill

Sanitas™ v.10.0.16 . UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 134 background values. 17.91% NDs. Annual per-constituent alpha = 0.006296. Individual comparison alpha = 0.0001089 (1 of 2). Comparing 4 points to limit. Assumes 25 future values.

Constituent: Sulfate as SO4 Analysis Run 4/12/2024 12:04 PM View: Appendix III - Two-Step

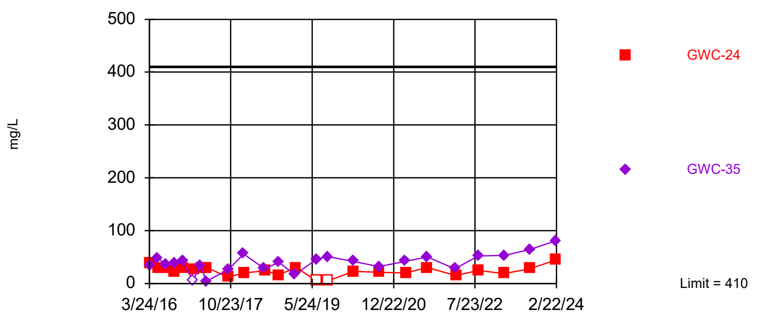
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 135 background values. 7.407% NDs. Annual per-constituent alpha = 0.006196. Individual comparison alpha = 0.0001072 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

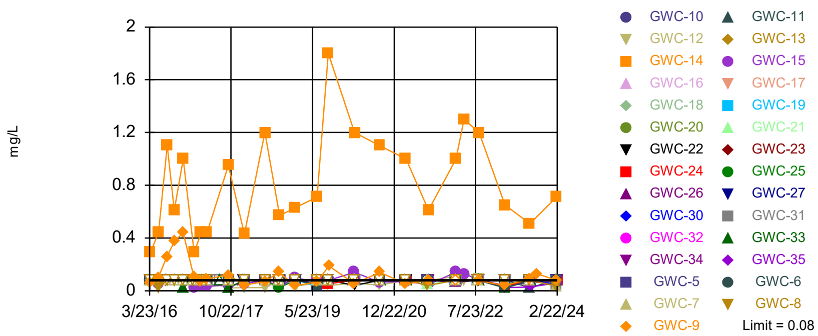
Sanitas™ v.10.0.16 . UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-14

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 136 background values. 97.06% NDs. Annual per-constituent alpha = 0.006097. Individual comparison alpha = 0.0001054 (1 of 2). Comparing 29 points to limit.

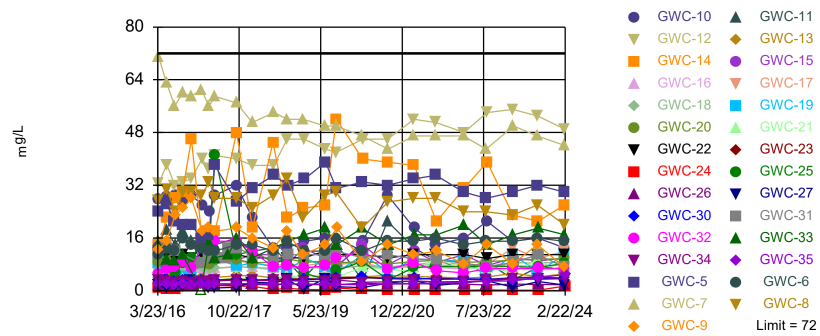
Constituent: Boron Analysis Run 4/12/2024 12:07 PM View: Appendix III - Interwell
Plant Wansley Data: Wansley Landfill

Sanitas™ v.10.0.16 . UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 135 background values. 0.7407% NDs. Annual per-constituent alpha = 0.006196. Individual comparison alpha = 0.0001072 (1 of 2). Comparing 29 points to limit.

Constituent: Calcium Analysis Run 4/12/2024 12:07 PM View: Appendix III - Interwell

APPENDIX C

Statistical Analysis Reports
July 2024 Monitoring Event

January 31, 2025

Southern Company Services
Attn: Mr. Trey Singleton
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308

Re: Plant Wansley Landfill – Fall 2024 Statistical Analysis

Dear Mr. Singleton,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the Fall 2024 Semi-Annual Groundwater Monitoring Statistical summary of the statistical analysis of groundwater data for Georgia Power Company's Plant Wansley Landfill. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the CCR program in 2016, and for the State program in 2011 in accordance with the Georgia EPD's Solid Waste Permit. An exception includes downgradient well GWC-10 which was first sampled in 2016 for both CCR and State programs. At least 8 background samples have been collected at each of the groundwater monitoring wells. Semi-annual sampling is performed in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations; and the July/August 2024 samples are evaluated in this report.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- o **Upgradient wells:** GWA-1, GWA-2, GWA-3, GWA-4, GWA-28, and GWA-29
- o **Downgradient wells:** GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-18, GWC-19, GWC-20, GWC-21, GWC-22, GWC-23, GWC-24, GWC-25, GWC-26, GWC-27, GWC-30, GWC-31, GWC-32, GWC-33, GWC-34, and GWC-35

While downgradient well GWC-24 has had periods of being historically dry, this well has been consistently sampled over the past few years. Note that chloride, fluoride, sulfate, and TDS in downgradient well GWC-31 were not sampled during the July/August sample event and, therefore, are not analyzed in this report. However, historic data from this well are plotted on the time series and box plots.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- o **CCR Appendix III -** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- o **Georgia EPD Appendix I -** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix I well/constituent pairs with 100% non-detects follows this letter.

Time series plots for Appendix I and III parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Due to varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects.

Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well and may result in slight changes in statistical limits between sample events. Substitution of the most recent reporting limit generally gives the most conservative limit in each case. As a result of elevated historic reporting limits for silver at upgradient well GWA-29, the most recent reporting limit of 0.001 mg/L was substituted across all wells for silver to construct statistical limits that are conservative from a regulatory perspective and are representative of present-day groundwater quality conditions.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves were provided previously, based on a 1-of-3 resample plan for Appendix I constituents and a 1-of-2 resample plan for Appendix III constituents, to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. During the background update in March 2022, sufficient samples were available for Appendix I constituents to provide sufficient power using a 1-of-2 resample plan and a power curve was provided with that report. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all parameters)
- # Constituents: 16
- # Downgradient wells: 29

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (pH, sulfate, and TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, and fluoride)
- # Constituents: 7
- # Downgradient wells: 29

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points is available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to spatial variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of spatial variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless all resamples also exceed the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Background Screening Summary – Georgia EPD Appendix I and CCR Appendix III Constituents – Conducted in February 2024

<u>Outlier Analysis</u>

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data through August 2023 at all wells for Appendix I and III constituents tested using intrawell methods and through February 2024 on pooled upgradient well data for Appendix III constituents tested using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged in the database, such as the highest values for pH at wells GWC-21, GWC-23, GWC-24, GWC-34, and GWC-35, the lowest value for pH at well GWC-23, and the highest value for TDS at GWC-23. All other measurements to be representative of spatial variation in both upgradient and downgradient wells or resulted from reported trace values compared to non-detect measurements within a record. Other values that were flagged but not identified by Tukey's test such as the highest values for cobalt at GWC-33, for silver at upgradient well GWA-29 and at downgradient well GWC-6, and for zinc at GWC-9, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective. No changes were made to previously flagged values in upgradient wells for constituents evaluated using interwell prediction limits.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter (Figure C).

<u>Mann-Whitney Evaluation</u>

For constituents requiring intrawell prediction limits (all Appendix I constituents and pH, sulfate, and TDS for the Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2021, to new compliance samples at each well through August 2023. Previously truncated records were also compared to more recent data through August 2023. Any records that were truncated during previous updates due to concentrations that were not representative of present-day groundwater quality conditions used curtailed portions of the respective record for comparison with the Mann-Whitney test. Discussions of any truncated records were included in previous background update reports.

If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The Mann-Whitney test identified statistically significant differences for the following well/constituent pairs:

Appendix I:

- Antimony: GWA-1 (upgradient), GWC-13, GWC-20
- Barium: GWC-12, GWC-34, GWC-35, and GWC-8
- Cadmium: GWA-28 (upgradient), GWC-13, GWC-19, GWC-21, GWC-31, GWC-34, GWC-7, and GWC-9
- Cobalt: GWC-11 and GWC-5
- Lead: GWC-13, GWC-16, and GWC-7
- Nickel: GWA-2, GWA-4 (both upgradient), and GWC-26
- Vanadium: GWC-18
- Zinc: GWC-32

Appendix III:

- pH: GWC-9
- Sulfate: GWC-10, GWC-12, GWC-32, GWC-33, and GWC-7
- TDS: GWC-7

The majority of these differences for both Appendix I and Appendix III resulted from reported trace values compared to non-detect results within a given record. In some cases, while the median of the compliance data was identified as significantly different from the background median, the reported concentrations in more recent data were similar to those reported historically. Examples include barium in wells GWC-12, GWC-34, and GWC-8; pH in well GWC-9; sulfate in well GWC-32; and zinc in well WC-32. Therefore, all records were updated through August 2023. An exception is for barium in downgradient well GWC-35 where an increasing trend was observed among compliance data; therefore, this record was not updated with data through August 2023.

Additionally, the historical portion of the records for cobalt at wells GWC-11 and GWC-5; sulfate in wells GWC-10, GWC-33, and GWC-7; and TDS in GWC-7 were truncated to use the more recent portion of the records with lower reported concentrations than those reported historically within each record. This step serves to provide prediction limits that are conservative (i.e., lower) from a regulatory perspective.

Regarding the statistically significant increase in medians for sulfate at downgradient well GWC-12, the historical portion of the record was truncated to use more recent and stable measurements for construction of an intrawell prediction limit. The slight increase in low-level measurements is, reportedly, attributed to an above-ground expansion joint failure which occurred on a return water pipe in the area in 2014 rather than a result of an impact from the regulated lined landfill.

A summary of background date ranges for these well/constituent pairs, along with other well/constituent pairs with truncated records, follows this letter. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier.

Upgradient Well Trend Tests – Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the parameters tested using interwell prediction limits—boron, calcium, chloride, and fluoride (Appendix III) to identify statistically significant increasing or decreasing trends in background at the 99% confidence level. The following statistically significant trends were noted:

Increasing:
- Calcium: GWA-1 and GWA-28
- Chloride: GWA-3

Decreasing:
- Chloride: GWA-29
- Fluoride: GWA-29

The majority of identified significant trends were marginal relative to the average concentrations therefore, no adjustments were required. Truncation of upgradient well records to remove decreasing trends should be done with caution since the higher concentrations could appear in future years at downgradient wells in the absence of facility impacts.

Statistical Analysis of Georgia EPD Appendix I Constituents – Fall 2024

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to spatial variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of spatial variation rather than impacts of the landfill.

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August 2023, except for the cases mentioned above, for each well with detections (Figure D). No statistical analyses were required for well/constituent pairs with 100% non-detects. The July/August 2024 compliance data are compared to the intrawell background limits.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of the Georgia EPD prediction limits follows this report. Exceedances were noted for the following well/constituent pairs:

- Barium: GWC-18 and GWC-35
- Copper: GWC-9
- Nickel: GWC-9
- Zinc: GWC-9, GWC-11, and GWC-12

Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through July/August 2024 to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure E). The following exceedance was identified:

- Nickel: GWC-9

Trend Test Analysis – Appendix I Constituents

Data from downgradient well/constituent pairs for Appendix I constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure F). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and the following statistically significant trends were identified:

Increasing:

- Barium: GWA-4 (upgradient), GWC-18, and GWC-35
- Zinc: GWA-28 (upgradient)

Decreasing:

- Copper: GWA-29 (upgradient)
- Nickel: GWA-1, GWA-2, GWA-4, and GWA-29 (all upgradient)

Statistical Analysis of CCR Appendix III Parameters – Fall 2024

As mentioned above, intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether apparent exceedances are present.

Intrawell Prediction Limits

For sulfate, pH, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2023 except for cases mentioned above, (Figure G). Additionally, for all well/constituent pairs except those mentioned previously, the July/August 2024 samples were compared to established statistical limits. Please note that prediction limits for sulfate in GWC-17 and GWC-21 changed slightly during this analysis due to varying reporting limits in the most recent data. Exceedances were noted for the following well/constituent pairs:

- pH (lower limit): GWA-2 (upgradient)
- TDS: GWC-35

Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data July/August 2024 to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure H). No exceedances were identified.

Interwell Prediction Limits

For boron, calcium, chloride, and fluoride which are evaluated using all historical upgradient well data through July/August 2024 to construct interwell prediction limits combined with a 1-of-2 resample plan (Figure I). The following statistically significant increases were identified:

- Boron: GWC-9, GWC-12, GWC-14, and GWC-35
- Chloride: GWC-14

Trend Test Analysis – Appendix III Constituents

Data from downgradient well/constituent pairs for Appendix III constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure J). As mentioned above, upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and the following statistically significant trends were identified:

Increasing:

- Chloride: GWA-1 and GWA-3 (both upgradient)
- TDS: GWC-35

Resample Reports – September 2024

Additional data were collected in September 2024 for the following well/constituent pairs found to exceed the interwell prediction limits:

- Boron: GWC-9 and GWC-35

Note that pH was also collected in September 2024 at wells GWC-9 and GWC-35. Intrawell prediction limits were constructed for pH using background data through August 2023 to compare the September 2024 observations (Figure K). No exceedances were identified. Interwell prediction limits were constructed for boron using pooled upgradient well data through August 2024 to compare the September 2024 resamples (Figure L). Exceedances were identified for the following well/constituent pairs:

- Boron: GWC-9 and GWC-35

Summary

Based on the statistical analyses of the July/August 2024 observations and September 2024 resamples for Appendix I and III constituents, the following downgradient prediction limit exceedances were identified:

<u>Appendix I</u>
- Nickel: GWC-9

<u>Appendix III</u>
- Boron: GWC-9, GWC-12, GWC-14, and GWC-35
- Chloride: GWC-14

The Sen's Slope/Mann-Kendall trend test was used to identify statistically significant trends for any Appendix I and Appendix III well/constituent pairs initially found to exceed their respective prediction limit. The following statistically significant trends were identified:

Increasing:
- Barium: GWA-4 (upgradient), GWC-18, and GWC-35
- Chloride: GWA-1 and GWA-3 (both upgradient)
- TDS: GWC-35
- Zinc: GWA-28 (upgradient)

Decreasing:

- Copper: GWA-29 (upgradient)
- Nickel: GWA-1, GWA-2, GWA-4, and GWA-29 (all upgradient)

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Wansley Landfill. If you have any questions or comments, please feel free to contact us.

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 27 background values. 37.04% NDs. Well-constituent pair annual alpha = 0.004998. Individual comparison alpha = 0.002502 (1 of 2).

Sanitas™ v.10.0.22 Software licensed to Groundwater Stats Consulting. UG

Within Limit

Prediction Limit

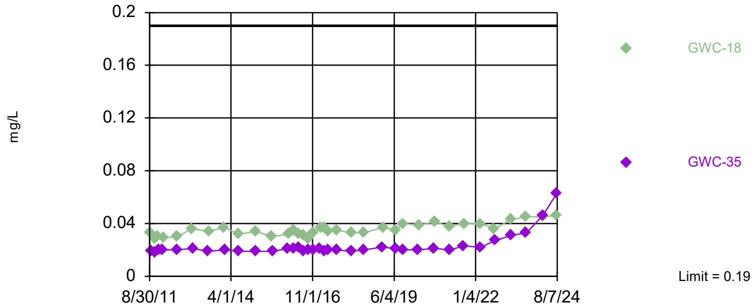
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 199 background values. 14.07% NDs. Annual per-constituent alpha = 0.002867. Individual comparison alpha = 0.00004949 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 162 background values. 23.46% NDs. Annual per-constituent alpha = 0.004301. Individual comparison alpha = 0.00007431 (1 of 2). Comparing 3 points to limit. Assumes 26 future values.

Within Limits

Prediction Limit

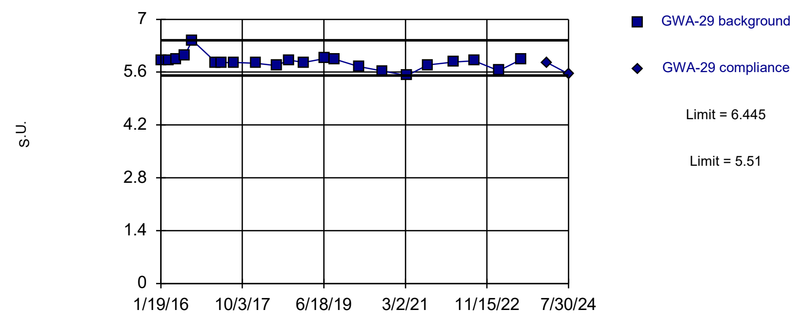
Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 22 background values. Well-constituent pair annual alpha = 0.0148. Individual comparison alpha = 0.007415 (1 of 2).

Hollow symbols indicate censored values.

Within Limit

Prediction Limit

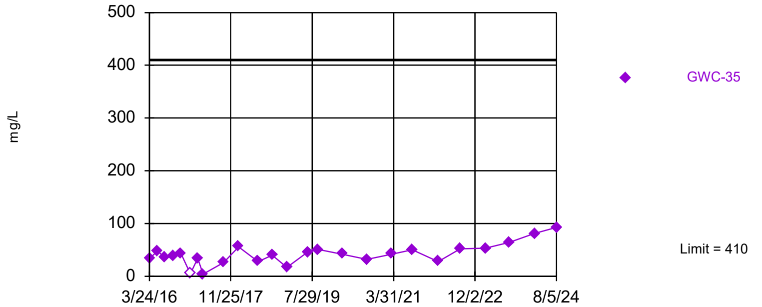
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 141 background values. 7.092% NDs. Annual per-constituent alpha = 0.005634. Individual comparison alpha = 0.00009741 (1 of 2). Assumes 28 future values.

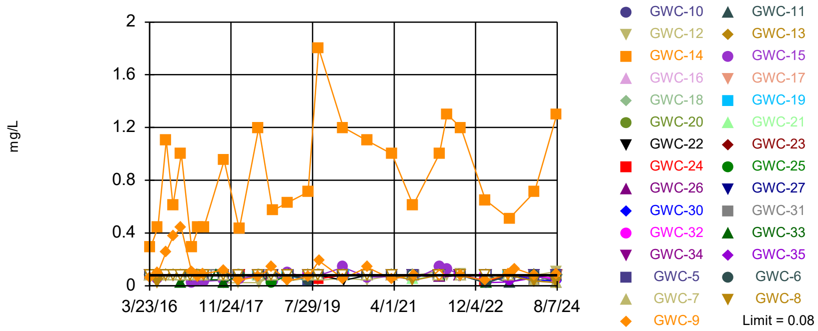
Sanitas™ v.10.0.22 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-12, GWC-14, GWC-35, GWC-9

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 142 background values. 97.18% NDs. Annual per-constituent alpha = 0.005569. Individual comparison alpha = 0.00009627 (1 of 2). Comparing 29 points to limit.

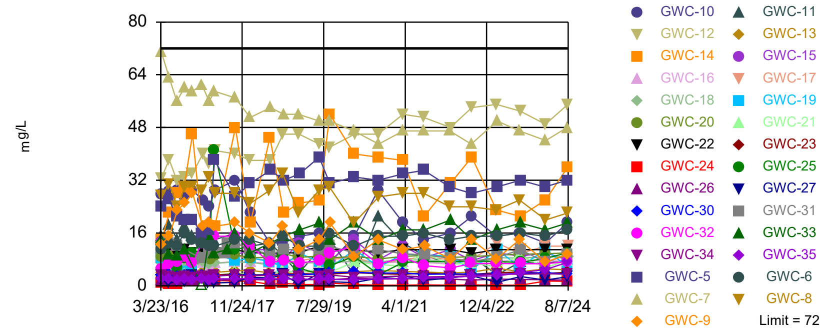
Constituent: Boron Analysis Run 10/3/2024 12:41 PM View: Appendix III - Interwell
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.22 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 141 background values. 0.7092% NDs. Annual per-constituent alpha = 0.005634. Individual comparison alpha = 0.00009741 (1 of 2). Comparing 29 points to limit.

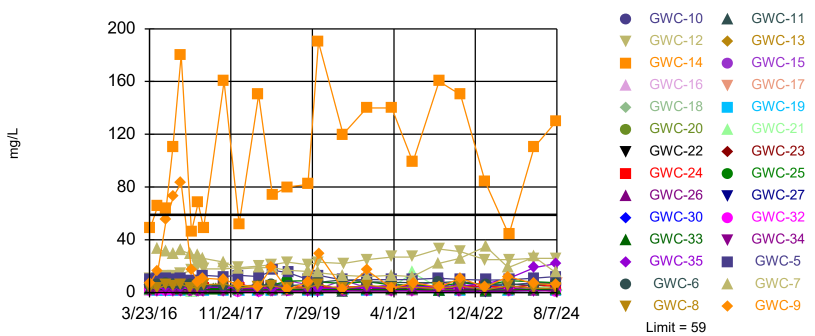
Constituent: Calcium Analysis Run 10/3/2024 12:41 PM View: Appendix III - Interwell
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.22 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-14

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 141 background values. 0.7092% NDs. Annual per-constituent alpha = 0.005634. Individual comparison alpha = 0.00009741 (1 of 2). Comparing 28 points to limit. Assumes 1 future value.

Constituent: Chloride Analysis Run 10/3/2024 12:41 PM View: Appendix III - Interwell

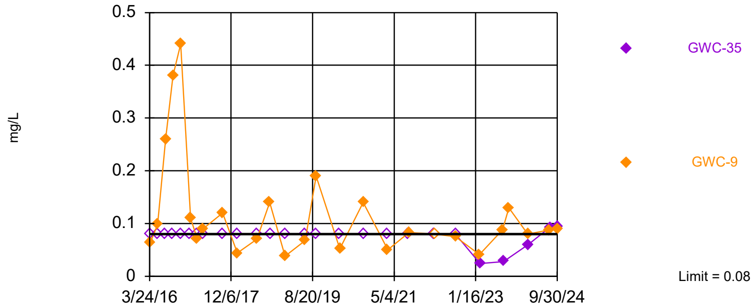
Exceeds Limit: GWC-35, GWC-9

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 142 background values. 97.18% NDs. Annual per-constituent alpha = 0.005569. Individual comparison alpha = 0.00009627 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

CERTIFICATION STATEMENT

I hereby certify that the information used in this alternate source demonstration for the coal combustion residuals (CCR) Unit located at Georgia Power's Plant Wansley located at 1371 Liberty Church Road, Carrollton, Georgia, and designated as the Coal Combustion By-Product Disposal Facility, is accurate pursuant to the requirements of 40 CFR §257.94(e)(2). I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g).

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) report has been prepared to address a statistically significant increase (SSI) identified in the groundwater monitoring network at the Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the Site) following the second semiannual detection monitoring event of 2023. The SSI was identified for Appendix III constituent boron at detection monitoring well GWC-9. An ASD addressing boron at GWC-9 was previously submitted to Georgia Environmental Protection Division (EPD) in 2018 (ACC, 2018). The complete 2018 ASD is provided as Appendix A. This ASD has been prepared pursuant to 40 Code of Federal Regulations (CFR) 257.94(e)(2).

The Site, located in northeast Heard County and southeast Carroll County, Georgia, is comprised of three cells within an approximate 73-acre footprint (Figure 1). The landfill is permitted to operate by the Georgia EPD Solid Waste Handling Permit No. 074-005D(CCR).

In August 2023, a semiannual detection monitoring event was conducted at the Site (ACC, January 2024) in accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 CFR 257 Subpart D; published in 80 Federal Register 21302-21501, April 17, 2015) and the Site, EPD approved, *Groundwater Monitoring Plan* (HHNT, 2022). As a result of the statistical analysis, performed by Groundwater Stats Consulting (GSC), an SSI for the Appendix III constituent boron was identified at detection groundwater monitoring well GWC-9 (See Figure 2 for the well location).

The concentration of boron in the sample from GWC-9 was 0.088 milligrams per liter (mg/L), slightly above the statistically derived site prediction limit of 0.080 mg/L. A verification resample was collected for boron in September 2023, which verified the SSI at a concentration of 0.13 mg/L. The statistical analysis of the August and September 2023 data was performed in accordance with the USEPA document Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance (Unified Guidance) (USEPA, 2009).

GWC-9 was sampled again on February 19, 2024, for the first 2024 semiannual groundwater sampling event. The concentration of boron for that sampling event was 0.080 mg/L which equals the site prediction limit, and therefore, will not be calculated as a statistical exceedance for the 2024 semiannual groundwater event.

Since the submittal of the 2018 ASD (Appendix A), concentrations of boron in GWC-9 decreased to below the site prediction limit and boron exhibited a decreasing trend in this well since November 2016. However, the August and September 2023 concentrations of boron in GWC-9 increased to above the site prediction limit (see Figure 3 – Boron Time Series Plot for GWC-9). This ASD has been prepared to address the recent boron SSI in GWC-9.

2.0 ALTERNATE SOURCE DEMONSTRATION

This ASD builds on information provided in the 2018 ASD. Because the CCR Unit has a high-density polyethylene (HDPE) liner and leachate collection system, it is unlikely that the CCR Unit is the direct source of groundwater impact at GWC-9. Due to the lined CCR Unit and review of available Site data, the SSI reported for boron at well GWC-9 is not associated with a release from the CCR Unit. The following sections provide specific demonstrations to support this ASD such as a previous operational issue related to dust suppression and natural variation in groundwater quality.

2.1 Dust Suppression

As mentioned in the 2018 ASD (Appendix A), during drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond) for road dust suppression. This retention pond water had been treated prior to use for dust suppression; however, it may have exhibited slightly different chemical characteristics than the dust suppression water used during non-drought conditions. This may have accounted for the 2016 boron increases and subsequent decline after the drought ended, and the data supports this as the concentration of boron declined after 2017. An operational issue related to dust suppression is the likely source for the initial 2016 concentrations of boron found in GWC-9.

2.2 Natural Variation in Groundwater Quality

The low-level boron concentrations at GWC-9 have shown variability between 2016 through February 2024, with ranges from non-detect (ND) [March 2022] to 0.44 milligrams per liter (mg/L) [November 2016], as shown on Figure 3. Overall, the concentration of boron in GWC-9 has declined since the November 2016 peak value of 0.44 mg/L. GWC-9 was sampled on February 19, 2024, for the 2024 semiannual groundwater sampling event. The concentration of boron for that sampling event was 0.080 mg/L which equals the site prediction limit and illustrates the low-level nature of boron concentration at GWC-9. There is no maximum contaminant level (MCL) established for boron, but concentrations of boron in GWC-9 have been well below the USEPA Regional Screening Level of 4.0 mg/L. The February 2024 laboratory analytical data report J246863-1 is provided in Appendix B.

A review of Plant Wansley Ash Pond 1 data shows that the site background concentrations for boron at the Ash Pond is 0.10 mg/L (Georgia Power Company, 2024). This boron concentration was from monitoring well WGWA-18 (Figure 7) during the August 2021 sampling event. This background concentration is higher than the site background concentration for boron at the Plant Wansley CCR Landfill which is 0.080 mg/L. This demonstrates that background concentrations of boron at Plant Wansley, while low-level, are spatially variable. The initial boron concentration of 0.088 mg/L for GWC-9 during the second 2023 semiannual sampling period was below the site background at Ash Pond 1 and the most recent boron concentration data from GWC-9 (February 2024) was equal to the site prediction limit and, therefore, will not be calculated as a statistical increase at the Site.

The variation in the concentration of boron in GWC-9 may also be attributed to fluctuations in groundwater elevations. As shown on Figure 4, boron concentrations in GWC-9 show an inverse correlation when compared to minor changes in groundwater elevations. As groundwater elevations decrease, the concentration of boron increases and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9 (Appendix C), as discussed in the following section. Leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.

2.3 Geochemical Characterization

The Piper diagram on Figure 5 was created from the groundwater data collected during the February 2024 semiannual sampling event. Displayed on the figure is a highlighted section in which typical CCR leachate would plot on the diagram based upon fine ash leaching research (Zielke-Olivier and Vermeulen 2019). Figure 5 shows that the water types displayed by the upgradient groundwater wells and downgradient groundwater well GWC-9 data are generally similar and are not indicative of CCR source water. As demonstrated in the figure, the data for GWC-9 is similar to the data for upgradient well GWA-2. In general, the data for GWC-9 plots in similar areas of the diagram as the rest of the upgradient monitoring wells at the Site and in a different area than typical coal ash leachate.

GWC-14 was included in Figure 5 for comparison purposes. A boron SSI was also confirmed in GWC-14 during the August 2023 reporting period. However, the boron SSI in GWC-14 has been addressed by an August 2022 ASD Addendum, which has been approved by Geogia EPD. The cause of the SSIs for GWC-14 has been attributed to an aboveground expansion joint failure that was directly upgradient of GWC-14. This incident has impacted GWC-14 with leachate that was being transferred from the return water pond through the return water dual wall pipes to the plant for operational purposes. If GWC-9 is being impacted from leachate from the landfill you would expect to see similarities in the water type between GWC-9 and GWC-14. However, as displayed in Figure 5, GWC-9 does not plot near GWC-14 and instead plots similarly to background wells at the Site. The water type displayed for GWC-14 plots closer to the typical coal ash leachate area of the diagram. This suggests that GWC-9 is not being impacted by the CCR Unit.

Stiff diagrams in Figure 6 generally support the data derived from the Piper plots in Figure 5, showing water types not indicative of CCR leachate. Bicarbonate ions are similar in upgradient well GWA-2 and downgradient well GWC-9, suggesting similar natural groundwater type in both upgradient and downgradient wells. Additionally, as with Figure 5, GWC-14 has been included in Figure 6 for comparison purposes. The stiff diagrams for GWC-9 and GWC-14 do not display similarities which further suggests that GWC-9 is not being impacted by the CCR Unit.

The United States Geological Survey (USGS) National Geochemical Database (NGDB) shows that the USGS took several hard rock samples at locations around Plant Wansley in 1967, which predates waste placement at the Wansley Landfill. USGS sample locations AEW095, AEW096, AEW087, and AEW088 all contained boron at concentrations of 50, 20, 50, and 10 parts per million (ppm) by weight, respectively. Of those locations, AEW095 and AEW096 are located nearest Wansley Landfill, as shown in Figure 7, and are within, or near, the same geological layer (granitic gneiss) for GWC-9. Uppin and Karro (2013) state that one factor controlling the groundwater chemistry is the lithological composition of water-bearing rocks and that the presence of boron bearing minerals in the host rock and their interaction with water are considered to be the main cause of boron enrichment in groundwater. The leachability of boron increases at longer contact times and is also influenced by the mixing speed and/or liquid-to-solid ratio (Tabelin *et. al*., 2013). The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron-containing bedrock and fluctuations in groundwater elevation. As stated in the previous section, as groundwater elevations decrease, the concentration of boron increases, and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9.

3.0 CONCLUSIONS AND RECOMMENDATIONS

The Plant Wansley Landfill August 2023 Statistical Analysis report identified a verified SSI for boron in GWC-9. This ASD demonstrates that the original SSI of boron at GWC-9 is attributed to a previous operational issue related to dust suppression. Ongoing concentrations of boron are attributed to natural variation in groundwater quality due to the lithological composition of water-bearing rocks at the Site that contain boron bearing minerals and their interaction with groundwater.

Lines of evidence that supports this ASD conclusion include:

- Boron concentrations at GWC-9 have shown variability between 2016 to February 2024, with ranges from ND to 0.44 mg/L. Overall, the concentration of boron in GWC-9 has declined since the November 2016 temporary peak value of 0.44 mg/L, which was attributed to a previous operation issue related to dust suppression water. The most recent boron concentration data from GWC-9 (February 2024) was equal to the site prediction limit and will not be calculated as an SSI for the 2024 semiannual groundwater sampling event.
- Site groundwater geochemistry demonstrates similarity of water quality between GWC-9 and background conditions of upgradient wells, specifically GWA-2. Additionally, leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.
- Groundwater elevations show an inverse correlation with boron concentrations, in which lower groundwater elevations may result in slightly higher concentrations of boron. This inverse correlation explains fluctuations in boron concentrations that are attributed to naturally derived sources from parent rock, as evidenced in the comparison of background concentrations of boron at the Ash Pond (0.10 mg/L) and Plant Wansley CCR Landfill (0.080 mg/L).

- The lithological composition of rocks at the Site contain boron. The leachability of boron in hard rock increases with longer contact times and is also influenced by the mixing speed interaction and/or liquid-to-solid ratio. The inverse relationship between groundwater elevation and the concentration of boron indicates an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9. The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron containing bedrock and fluctuations in groundwater elevation.

Based on the information presented in this ASD, groundwater monitoring at Plant Wansley Landfill will remain in detection monitoring. Detection monitoring results will continue to be presented in the Semiannual and Annual Groundwater Monitoring and Corrective Action Reports.

SECTION 1
Introduction

This document presents an alternate source demonstration (ASD) for statistically significant increases (SSIs) as identified in the 2017 Annual Groundwater Monitoring and Corrective Action Report submitted on January 31, 2018. This ASD has been prepared pursuant to 40 CFR 257.94(e)(2), which states that "the owner/operator may demonstrate that a source other than the coal combustion residual (CCR) unit caused the statistically significant increase over background levels for a constituent or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality."

Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the site) is located in northeast Heard County and southeast Carroll County on Liberty Church Road, approximately 12 miles southeast of the City of Carrollton. The plant property encompasses approximately 5,100 acres and the landfill is permitted to operate by the Georgia Environmental Protection Division (EPD) [Permit No. 074-005D(L)(I)]. The disposal facility is comprised of three cells within an approximate 73-acre disposal footprint. Figure 1, Plant Wansley CCB Disposal Facility Site Location Map, depicts the site location referenced to regional landmarks. The facility has received only flue gas desulfurization gypsum waste from GPC – Plant Wansley to date: however, a recently approved permit modification will allow for all forms of CCR to be disposed in the future.

In accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR21302-21501, April 17, 2015), the facility prepared the *2017 Annual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted at the site and satisfy the requirements of §257.90(e). Groundwater monitoring and reporting for the site is performed in accordance with the monitoring requirements §257.90 through §257.98. In that report, SSIs were identified as follows:

- Boron: GWC-9 and GWC-14
- Chloride: GWC-14
- Fluoride: GWC-32

SECTION 2
Alternate Source Demonstration

As allowed by §257.94(e)(2), the site may demonstrate that a source other than the CCR unit caused the SSI for a constituent or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. This report demonstrates an alternate source for SSIs of constituents included in Appendix III of 40 CFR. §257 identified following analysis of the first detection monitoring event data. SSIs were identified for three groundwater monitoring network wells (GWC-9, GWC-14, and GWC-32). Two of these locations (GWC-9 and GWC-14) were previously identified has having SSIs under state permitting requirements. The SSIs at these locations were addressed in an EPD-approved ASD completed in 2017. This ASD builds on information provided in the 2017 document to address the newly required Appendix III constituents. There are conditions unique to each individual well where one or more SSIs were identified at the site. Therefore, the following sections provide specific demonstrations, by well, to support that the site is not the source of the SSI. A recent potentiometric surface map is provided for reference as Figure 2, Plant Wansley CCB January 2018 Potentiometric Surface Map.

2.1 GWC-9

2.1.1 SSI Identification

One Appendix III analyte (boron) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 0.12 milligrams per liter (mg/L) reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 0.05 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was confirmed at a concentration 0.10 mg/L.

2.1.2 Data Review

Background monitoring was initiated in 2016 and continued through 2017. As shown in Figure 3, Boron Time Series Plot for GWC-9, the concentration of boron was reported at trace levels during the initial rounds of background monitoring (estimated "J" values of 0.0635J and 0.0981J mg/L March and May 2016, respectively). An increase in concentration to 0.26 mg/L was reported in July 2016 and continued until reaching a maximum level of 0.44 mg/L in November 2016. The concentration declined to 0.11 mg/L in January 2017 and remained in a range of 0.071 to 0.12 mg/L for the duration of 2017. The well was most recently sampled in January 2018 as part of the first 2018 semi-annual monitoring event required by the current solid waste permit. The January 2018 concentration of 0.044J mg/L was less than the site prediction limit of 0.050 mg/L.

Other Appendix III parameter trends were reviewed in order to gain insight into the source of the boron increase and subsequent decline. Based on a review of these data, chloride, total dissolved solids (TDS) and to a lesser extent calcium exhibit trends similar to boron. All of these analytes showed increases in late 2016 reaching maximum levels during the November 2016 event then subsequently declining to near the original early 2016 levels. Time series plots for these analytes are provided in Figure 4 (Chloride Time Series Plot for GWC-9), Figure 5 (TDS Time Series Plot for GWC-9) and Figure 6 (Calcium Time Series Plot for GWC-9).

Water level and precipitation data were also reviewed. The increasing analyte trends correspond to a period of relative drought. According the National Oceanic and Atmospheric Administration (NOAA) the average annual precipitation for Carrolton, Georgia is 51.4 inches. The University Georgia College of Agricultural & Environmental Sciences maintains a statewide weather monitoring network including a Plant Wansley station. Data from the Plant Wansley station indicate that 2016 was a significantly drier than average year with total precipitation of 39.6 inches. Conversely, both 2015 and 2017 were wetter than average with respective totals of 60.2 and 69.7 inches. The period between September 19 and November 28, 2016 was notably dry in that no precipitation event greater than 0.1 inches occurred. As shown in Figure 7, Groundwater Elevation and Boron Time Series Plot for GWC-9, the dry weather during late 2016 coincides with lower water groundwater elevations and higher boron concentrations at GWC-9.

2.1.3 Alternate Source Review

Based on a review of the facility's Design and Operation Plans and recent aerial photographs, direct leakage from the cell area is highly improbable. Very limited gypsum slurry has been directed into Cell 2 and the small amount that has been is located on the opposite side of the cell approximately 1200 feet from GWC-9. The landfill is a fully lined unit including a 60-mil thick high-density polyethylene (HPDE) liner underlain by a geosynthetic clay liner (GCL), a 6-inch layer of compacted clay (maximum permeability of 1 x 10^{-5} cm/sec), and structural fill. Two sedimentation basins and a return water pond capture all leachate, sluice water and storm water run-off generated in the lined cell areas.

Storm water runoff from the perimeter gravel road has occurred near GWC-9 (uphill from the pump booster station), as evidenced by erosion rills in the vicinity. The gravel road is not anticipated to be a significant source of impact; however, the road is serviced by water trucks used for dust suppression. During drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond). Water from this pond has been treated prior to release. However, it may exhibit slightly different chemical characteristics than the dust suppression water used during non-drought conditions (i.e. potentially accounting for the boron and chloride increases and subsequent decline after the drought ended). An operational issue related to dust suppression is a potential source.

2.1.4 Natural Variation in Groundwater Quality

As discussed in Section 2.1.2, an increasing trend in the concentrations of boron, chloride and TDS occurred during a period of relative drought in 2016. Concentrations diminished during a return of wetter weather during 2017 Lower groundwater elevations have the potential to result in fluctuations in the concentrations of naturally occurring analytes (i.e. groundwater is less diluted by rainwater during periods of relative drought). As shown in Figure 7 there appears to be an inverse relationship between the groundwater elevation and boron concentration. Therefore, a natural variation in groundwater quality is also a potential source.

2.1.5 Summary and Recommendations

The CCR unit is not the apparent source of the boron SSI. The lined landfill was constructed to prevent direct impact to groundwater and there is no waste in close proximity to the well. Dry weather conditions that occurred in 2016 indicate the possibility that a natural variation in groundwater quality occurred. Additionally, recent data indicate that conditions have returned to background levels and concentrations are no longer at SSI levels. The monitoring well should remain in detection monitoring as the assessment trigger is no longer present and an alternate source was identified.

2.2 GWC-14

2.2.1 SSI Identification

Two Appendix III analytes (boron and chloride) were identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as SSIs at this location. The respective concentrations of 0.95 and 160 mg/L for boron and chloride reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limits of 0.05 mg/L (boron) and 23 mg/L (chloride). A verification resample was collected on December 1, 2017 and the exceedances were verified at concentrations of 1.2 and 150 mg/L for boron and chloride, respectively.

2.2.2 Data Review

The concentration ranges for boron and chloride have shown variability during monitoring. As shown in Figure 8, Boron Time Series Plot for GWC-14 and Figure 9, Chloride Time Series Plot for GWC-14, the range of boron concentrations is 0.29 to 1.2 mg/L and chloride 46 to 180 mg/L. However, even at the low end of the ranges the concentrations are above site background conditions.

2.2.3 Alternate Source Review

Groundwater monitoring well GWC-14 is located directly downhill and downgradient from the return water pond, return water pumps, and electrical control building. Effluent is transferred from the return water pond to the return water lines that connect to the plant where it is recycled for operations.

There have been historical operational issues in this area. An unpermitted discharge due to the failure of an HDPE expansion joint on the return water pipe occurred on August 30, 2014. The Georgia Environmental Protection Division was immediately verbally notified and subsequently provided written notification. The facility made immediate repairs and also began to evaluate long-term corrective actions. The pond was temporarily taken out-of-service to allow repairs to be made beginning in early 2015. The concrete headwall, HDPE liner and soil berm were removed to expose the buried return water piping leading from the return water pond to the pumps. Repairs to the piping, liner and headwall were completed in early 2017. The pond is now fully repaired and functional.

2.2.4 Summary and Recommendations

The CCR unit is not the direct source of the boron and chloride SSIs. The apparent source is a return water piping failure that was identified and addressed. The facility completed repairs to the return water pond and piping in 2017 that will prevent future releases from occurring and thus allowing boron and chloride concentrations to eventually return to background levels. The monitoring well should remain in detection monitoring as an alternate source was identified.

2.3 GWC-32

2.3.1 SSI Identification

One Appendix III analyte (fluoride) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 3.4 mg/L reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 3.2 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was verified at a concentration of 3.4 mg/L.

2.3.2 Data Review

Concentrations of fluoride ranged from 2.1 to 3.9 mg/L in samples collected from GWC-32 during background monitoring. The concentrations reported during the compliance event and verification resample were within this range. Several nearby monitoring wells also produced consistent detections of fluoride (e.g. GWA-28, GWA-29, GWC-27, GWC-31 and GWC-33). Two of these locations, GWA-28 and GWA-29 are upgradient from Cell 3 and are used to characterize background conditions. Concentrations at these locations ranged from 1.4 to 3.2 mg/L during background monitoring. The site prediction limit of 3.2 mg/L was based on these data (i.e. maximum concentration reported in background).

Reported fluoride concentrations in multiple upgradient and downgradient wells at Cell 3, which has not yet been used for CCR disposal, are likely derived from a natural source in the underlying bedrock. The boring logs from these locations provided in Appendix A, Boring Logs, indicate that GWA-28, GWA-29, GWC-27, GWC-31, GWC-32, and GWC-33 are at least partially screened in a common lithology, the Long Island Creek Gneiss. This lithology is localized to this portion of Plant Wansley. Rock units encountered in other portions of the site include: biotite gneiss (easily differentiated from the Long Island Creek Gneiss by greater abundance of mafic minerals), quartzite, schist units and amphibolite units. As shown in Figures 1 and 2, these well locations are adjacent to each other. It is noted that one location in this area, GWC-30 did not produce fluoride detections. However, this location is differentiated from the others in that it is screened in overburden rather than bedrock. A time series plot depicting fluoride concentrations at these locations is provided as Figure 10, Fluoride Time Series Plot for Cell 3 Monitoring Wells.

2.3.3 Alternate Source Review

Groundwater monitoring well GWC-32 is adjacent to Cell 3. This cell is not contiguous with Cells 1 and 2 and has never received waste. Therefore, the CCR unit is not the apparent source.

2.3.4 Natural Variation in Groundwater Quality

Based on the commonality of the localized lithology, the Long Island Creek Gneiss was identified as a potential source of fluoride in groundwater samples from GWC-32 and other nearby locations. Identification of a natural bedrock source of fluoride is supported by the following evidences from (A) fluoride analysis in rock samples and (B) the major ionic concentrations in groundwater for evaluation of the chemical composition of groundwater.

A. ACC obtained core samples from the plant and/or SCS storage of three distinct site lithologies: Long Island Creek Gneiss, schist/amphibolite and quartzite. Core sample fragments were shipped to TestAmerica Pensacola for analysis of fluoride by EPA Method 9056. It should be noted that this laboratory method only accounts for water soluble fluoride and not concentrations present in the rock matrix. The actual whole rock concentration of fluoride is likely to be much higher. The sample results are summarized in Table 1 and the laboratory analytical report is included in Appendix B, Laboratory Analytical Results & Purge Data Sheets.

TABLE 1. Rock sample fluoride concentrations.

Sample Identification	Fluoride Concentration (mg/Kg)
PB-3 Long Island Gneiss 56-57’	11
PB-4 Long Island Gneiss 49-50’	9.3
PB-8 Schist/Amphibolite 123-124’	<1.3
PB-9 Schist/Amphibolite 65-66’	3.4J
APC-5D Quartzite 90-91’	<1.3

Notes:
1. mg/Kg = milligrams per kilogram
2. “J” = reported concentration is less than laboratory reporting limit and considered estimated.

The results confirm that there is a significantly higher concentration of fluoride in the Long Island Creek Gneiss relative to other site lithologies that were analyzed. Therefore, wells screened in this unit may be more likely to produce detections of fluoride. Concentrations of fluoride are likely to be somewhat variable within the Long Island Creek Gneiss and wells screened in this formation may show different levels of fluoride in groundwater. It is likely that GWC-32 is screened in a zone of slightly greater fluoride concentrations than the upgradient locations.

B. On March 15 -16, 2018 ACC personnel sampled GWA-28, GWA-29, GWC-27, GWC-31, and GWC-32 for a suite of cations (calcium, magnesium, sodium, and potassium) and anions (carbonate, bicarbonate, sulfate, and chloride). The samples were collected using standard site sampling techniques and submitted to TAL-Pensacola for analysis. The analytical data are presented as Piper Plot and Stiff Diagrams. As shown in Figure 11, Piper Plot for Cell 3 Monitoring Wells and Figure 12, Stiff Diagrams for Cell 3 Monitoring Wells, there are no significant differences in the major ionic concentrations of the samples (i.e. all are low level and indicative of background conditions). This indicates that the chemical composition of groundwater between upgradient and downgradient locations are relatively similar in the vicinity of Cell 3. Therefore, all of these locations appear to represent background conditions as would be anticipated with a cell that has not received waste. The laboratory report and field purge logs are provided in Appendix A.

2.3.5 Summary and Recommendations

The CCR unit is not the source of the fluoride SSI. The apparent source is natural variability in groundwater. Testing of the rock unit present beneath a portion of Cell 3, the Long Island Creek Gniess confirm that fluoride concentrations in this unit are higher than at least two other rock units present in other areas of the site. A Piper Plot and Stiff Diagrams confirm that there are no significant differences in cation/anion ratios between any of the Cell 3 wells tested. Cell 3 has yet to receive waste, therefore the geochemical similarity between all locations is consistent with what would be anticipated. Groundwater monitoring location GWC-32 should remain in detection monitoring based on the identification of the alternate source.

SECTION 3
Conclusions and Recommendations

The *2017 Annual Groundwater Monitoring and Corrective Action Report* was prepared to satisfy the requirements of §257.90(e). In that report SSIs were identified for three groundwater monitoring locations: GWC-9 (boron), GWC-14 (boron and chloride) and GWC-32 (fluoride). This ASD has identified the following sources for each location with a SSI:

- GWC-9
  - A source other than the CCR unit caused the SSI (no waste placement near the well; operational issue)
  - Natural variation in groundwater quality (drought condition)
- GWC-14
  - A source other than the CCR unit caused the SSI (operational issue and repair)
- GWC-32
  - A source other than the CCR unit caused the SSI (no waste placement near the well)
  - Natural variation in groundwater quality (natural occurrence in rock formation)

All locations have met the requirements for a demonstration listed in §257.94(e)(2). Therefore, all locations should remain in detection monitoring at this time. Detection monitoring results should continue to be presented in the Annual Groundwater Monitoring and Corrective Action Reports, as well as state semi-annual groundwater monitoring reports.

DATE STARTED 2/22/2011 COMPLETED 2/22/2011 SURF. ELEV. Not Surveyed COORDINATES:
CONTRACTOR Boart Longyear EQUIPMENT METHOD Rotosonic
DRILLED BY LOGGED BY G. Dyer CHECKED BY ANGLE BEARING
BORING DEPTH 43 ft. GROUND WATER DEPTH: DURING COMP. DELAYED 19.4 ft. after 24 hrs.
NOTES Well installed. Refer to well data sheet.

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	SAMPLE TYPE NUMBER	SAMPLE DEPTH (ft.)	BLOW COUNTS (N VALUE)	RECOVERY % (RQD)	COMMENTS
0 - 5		**Silty Sand (SM)** - orange, damp, low plasticity, w/ gravel sized pieces of quartz - quartz is angular - sample is weathered from schist, some clay found (approximately 10%), micas weathering to white clay minerals					
5		- orange, slightly damp, orange grading down to white; fewer clay minerals (approximately 5%), sediment is less consolidated than 0' - 4' section. white material is highly weathered schist, relic cleavages and foliations can barely be discerned					no quartz, orange grades to white.
10		**Schist** - white, tan, has weathered to medium grained sands w/ less than 10% silt, wet - mottled tan, brown, weathered, coarse sand to gravel sized, poorly sorted and graded, gravel sized pieces are structually intact schist. grades to more tan, sand and gravel sized regolith, preferential bands of more competent schist found (dark), dry					perched 8' - 10' H2O.
15		- banded tan, orange, white, weathered, coarse sand to gravel sized, white sediments contain larger fragments of schist, dry					tan. orange. white/grey.
20		**Silty Sand (SM)** - tan, wet, medium grain					
		Poorly-graded Sand (SP) - mottled white, tan, orange, dry, fine to medium grain, w/ angular, gravel sized schist fragments					
25		**Silty Sand (SM)** - mottled tan, white, dry, clay particles present less than 2%, angular gravel to boulder sized fragments of schist					
30		**Partially Weathered Rock** - brown, orange, saprolite (schist/gneiss contact), zoned					
35 - 40		**Gneiss** - banded grey, white, competent, relic structures and foliations intact, sugary pegmatic quartz coating on cuttings, prevalent zones of oxidation suggesting fractures, fractures identified parallel to cleavage planes					last 10' drilled w/ water.
45		Bottom of borehole at 43.0 feet.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	15.1°C IR7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job ID: 400-150979-1

Laboratory: TestAmerica Pensacola

Narrative

Job Narrative
400-150979-1

HPLC/IC
Method(s) 300.0: The method blank for analytical batch 391935 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 300.0: The method blank for analytical batch 392174 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Metals
Method(s) 6020: The matrix spike (MS) recoveries for preparation batch 392217 and analytical batch 393106 were outside control limits. Insufficient spike in the matrix spike is suspected. The associated laboratory control sample (LCS) and post digestion spike (PDS) recoveries are within acceptance limits.

Method(s) 6020: The sample size used in the preparation of the matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 392217 and analytical batch 393106 was outside the 20% difference. As the relative percent difference (RPD) calculation is based upon the MS/MSD concentration as opposed to the MS/MSD percent recovery, elevated %RPD values were obtained.

General Chemistry
Method(s) SM 2320B: The sample duplicate precision for the following sample associated with analytical batch 391494 was outside control limits: (400-150979-A-2 DU). The associated Laboratory Control Sample(LCS) met acceptance criteria.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	4.4°C IR8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Case Narrative

Client: Southern Company
Project: Plant Wansley Landfill

Job ID: 680-246863-1

Job ID: 680-246863-1 Eurofins Savannah

Job Narrative
680-246863-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Receipt
The samples were received on 2/16/2024 10:03 AM, 2/17/2024 9:52 AM, 2/22/2024 10:19 AM and 2/24/2024 9:52 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 0.1°C, 0.9°C, 1.3°C, 1.8°C, 1.9°C, 3.0°C and 3.2°C.

HPLC/IC
Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/35) The data has been reported.
Chloride 86%
Fluoride 80%
Sulfate 79%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/49) The data has been reported.
Chloride 89%
Fluoride 83%
Sulfate 82%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/66) The data has been reported.
Chloride 89%
Fluoride 82%
Sulfate 82%

Method 300_ORGFM_28D: LCS/LCSD recovered outside the established limit of 90% for sulfate at 84% and 86%. (LCS 680-825238/100) and (LCSD 680-825238/99) The data has been reported.

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825241/66) The data has been reported.
Chloride 89%
Fluoride 82%
Sulfate 82%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825241/86) The data has been reported.
Chloride 82%
Fluoride 77%
Sulfate 76%

Method 300_ORGFM_28D: : LCS/LCSD recovered outside the established limit of 90%: (LCS 680-825241/102) and (LCSD 680-825241/101) The data ha been reported.
Chloride 83% / 84%
Fluoride 83% / 86%

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C: A lesser volume of sample was used for the following samples due to the nature of the sample matrix resulting in elevated reporting limits: WAN-GWA-4 (680-246863-3), WAN-LF-FD-04 (680-246863-8), WAN-GWC-5 (680-246877-1), WAN-GWC-12 (680-247011-3), WAN-GWC-14 (680-247011-5), and WAN-GWC-7 (680-247150-1).

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-823340 was outside control limits: (680-246830-C-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-823618 was outside control limits: (680-246862-E-17 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client: Southern Company
Job ID: 680-246863-1
Project/Site: Plant Wansley Landfill

Client Sample ID: WAN-GWC-5
Lab Sample ID: 680-246877-1
Date Collected: 02/14/24 15:00
Matrix: Water
Date Received: 02/17/24 09:52

Method: MCAWW 300.0-1993 R2.1 - Anions, Ion Chromatography

Accreditation/Certification Summary

Client: Southern Company
Job ID: 680-246863-1
Project/Site: Plant Wansley Landfill

Laboratory: Eurofins Savannah

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Florida	NELAP	E87052	06-30-24
Georgia	State	E87052	06-30-24

Laboratory: Eurofins Orlando

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Alabama	State	42800	06-30-24
Arkansas (DW)	State	FL00091	06-30-24
Florida	NELAP	E83018	06-30-24
Georgia (DW)	State	C055	06-30-24
Louisiana (All)	NELAP	239316	06-30-24
Louisiana (DW)	State	LA039	05-24-24
Mississippi	State	MS00007	06-30-24
New Mexico	State	FL00091	06-30-24
North Carolina (DW)	State	12712	07-31-24
Tennessee	State	TN04930	06-30-24
Texas	NELAP	T104704571	02-28-25
Washington	State	C1089	10-19-24

Method	Method Description	Protocol	Laboratory
300.0	Anions, Ion Chromatography	EPA	EET ORL
300.0-1993 R2.1	Anions, Ion Chromatography	MCAWW	EET SAV
6020B	Metals (ICP/MS)	SW846	EET SAV
7470A	Mercury	SW846	EET SAV
2540C-2011	Total Dissolved Solids (Dried at 180 °C)	SM	EET SAV
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET SAV

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

APPENDIX C
GWC-9 Boring Log

BORING GWC-9

SOUTHERN COMPANY

LOG OF TEST BORING

SOUTHERN COMPANY SERVICES, INC.
EARTH SCIENCE AND ENVIRONMENTAL ENGINEERING

PROJECT Plant Wansley
LOCATION Carrollton, Georgia

DATE STARTED 2/23/2011 COMPLETED 2/23/2011 SURF. ELEV. 709.71 COORDINATES: N - 1238673.12, E - 2027891.35
CONTRACTOR Boart Longyear EQUIPMENT METHOD Rotosonic
DRILLED BY LOGGED BY G. Dyer CHECKED BY ANGLE BEARING
BORING DEPTH 16.5 ft. GROUND WATER DEPTH: DURING COMP. DELAYED 4.2 ft. after 20 hrs.
NOTES Well installed. Refer to well data sheet.

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	SAMPLE TYPE NUMBER	SAMPLE DEPTH (ft.)	BLOW COUNTS (N VALUE)	RECOVERY % (RQD)	COMMENTS
		Silt (SM) - tan, brown, wet, low to medium plasticity, fine sand; few gravel sized pieces of quartz, clay fraction = 10%					
5		**Poorly-graded Sandy Gravel (SP)** - mottled tan, brown, dark grey, moist, low plasticity, medium to coarse grain, w/ gravel, gravel is comprised of quartz/gneissic fragments, some clay (approximately 9%)					
10		**Gneiss** - grey, white, hard, very competent, MOP iron oxide staining, some gold staining, quartz and feldspar bands 2" thick - grey, white, hard, very competent, small amounts of iron staining w/ some gold staining, no fractures					
15		**Poorly-graded Gravel (GP)** - zone of angular gravel, oxide staining					gravel resembles that of stream bed.
		Gneiss - grey, white, hard, some oxide staining, competent					
20		Bottom of borehole at 16.5 feet.					

NOTE:
Elevation in feet North American Vertical Datum of 1988 (NAVD).
Coordinates are in North American Datum of 1983 (NAD83)
Georgia State Plane East Zone.
Well resurveyed in December 2020.
