Prediction Limit

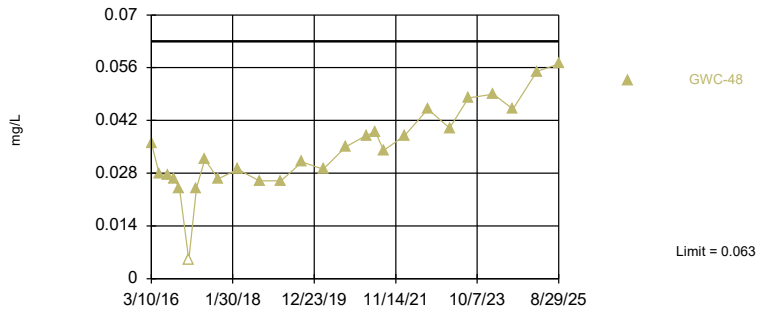
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 482 background values. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Assumes 25 future values.

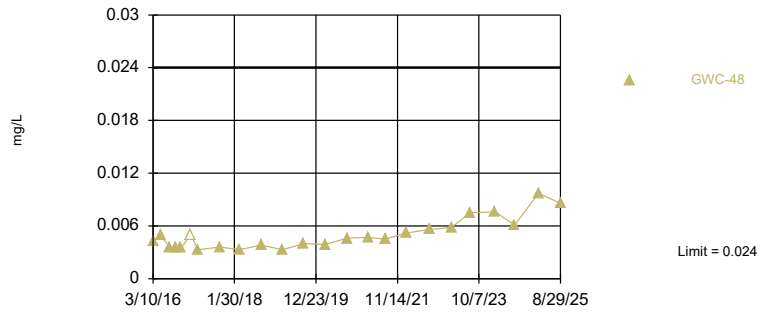
Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 417 background values. 62.59% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Assumes 25 future values.

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 371 background values. 56.87% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Assumes 25 future values.

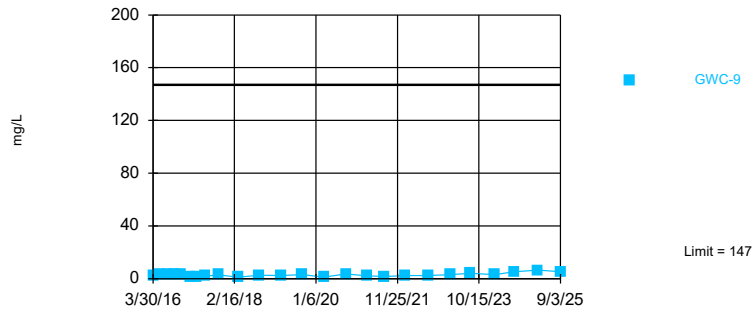
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 360 background values. 6.389% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Assumes 25 future values.

Prediction Limit

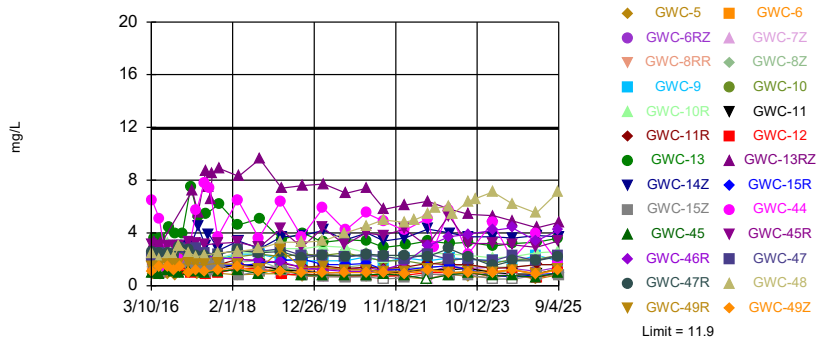
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 373 background values. 0.5362% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Comparing 26 points to limit.

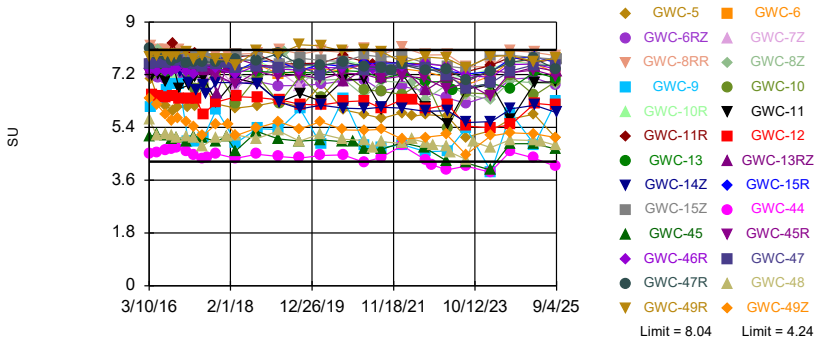
Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 377 background values. Annual per-constituent alpha = 0.005086. Individual comparison alpha = 0.00009793 (1 of 2). Comparing 26 points to limit.

Prediction Limit

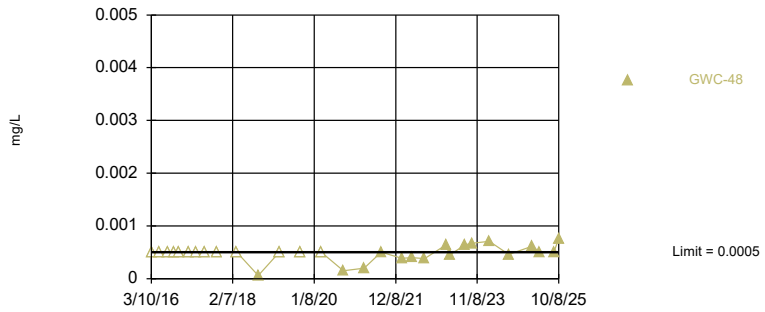
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 500 background values. 93.6% NDs. Annual per-constituent alpha = 0.002543. Individual comparison alpha = 0.00004896 (1 of 2). Assumes 25 future values.

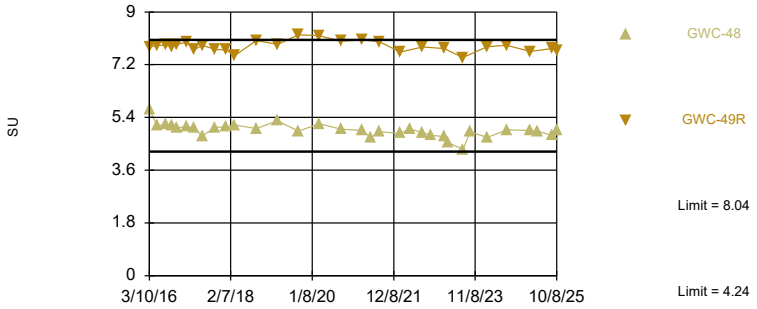
Within Limits

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 377 background values. Annual per-constituent alpha = 0.005086. Individual comparison alpha = 0.00009793 (1 of 2). Comparing 2 points to limit. Assumes 24 future values.

Re: Plant Bowen Landfill Cells 3-8
Screening, Background Update, and September 2025 Statistical Analysis

Dear Ms. Jurinko,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the screening, background update, and statistical analysis of groundwater quality for the September 2025 sample event for Georgia Power Company's Plant Bowen Landfill Cells 3 & 4. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Semi-annual sampling is conducted for USEPA's CCR Appendix III parameters, in addition to 16 parameters in accordance with the Georgia EPD's Solid Waste Permit. The monitoring well network, as provided by Southern Company Services, consists of the following:

The current monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient**: GWA-1, GWA-2, GWA-2R, GWA-3A, GWA-4RZ, GWA-39RZ, GWA-39Z, GWA-40, GWA-41, GWA-41R, GWA-42, GWA-43, GWA-43R, GWA-50, GWA-50R,
  - **Abandoned Upgradient**: GWA-51RZ, GWA-52, GWA-53, GWA-53R, GWA-54, GWA-55, GWA-55R, and GWA-56

- **Downgradient:** GWC-16R, GWC-17R, GWC-18, GWC-18R, GWC-19R, GWC-20R, GWC-21R, GWC-22R, GWC-23R, GWC-24R, GWC-25R, GWC-26, GWC-27, GWC-27R, GWC-28, GWC-29, GWC-29R, GWC-30, GWC-31, GWC-31R, GWC-32, GWC-33R, GWC-34, GWC-34R, GWC-35, GWC-57 and GWC-36A, GWC-36RA, GWC-37, and GWC-38

Downgradient wells GWC-26, GWC-27, GWC-27R, GWC-28, GWC-29, GWC-29R, GWC-30, GWC-31, GWC-31R, GWC-32, GWC-33R, GWC-34, GWC-34R, GWC-35, GWC-57 from Cells 5-8 were first sampled in June 2023 and have at least 8 background samples to date. Intrawell prediction limits are constructed for these wells during this report and data are screened as described below in the outlier analysis and trend test sections.

Note that upgradient well GWA-3 was replaced with well GWA-3A, which was first sampled in March 2021. Data from well GWA-3 have been combined with data from replacement well GWA-3A. A minimum of 8 samples has been collected from new well GWA-3A; therefore, the Mann-Whitney test of medians was used to compare newer observations collected only from well GWA-3A to historical observations collected from well GWA-3 for Appendix I and III constituents evaluated with intrawell prediction limits to determine whether the medians of data are statistically significantly different. This process is described below. When upgradient wells are included in trend tests to further evaluate any intrawell prediction limit exceedances at downgradient wells, the combined data from wells GWA-3 and GWA-3A will be used to determine whether statistically significant increasing or decreasing trends in groundwater quality are present over the entire record.

As described in the Minor Modification demonstration, data from upgradient wells GWA-51RZ, GWA-52, GWA-53, GWA-53R, GWA-54, GWA-55, GWA-55R, and GWA-56 (50-series upgradient wells), which represent historical groundwater quality upgradient of Cells 3 & 4 based on groundwater flow, are pooled with existing upgradient wells for the purpose of combining data for construction interwell prediction limits. While the 50-series upgradient wells are no longer sampled, data from these wells are included in the construction of interwell statistical limits, but are not evaluated with intrawell prediction limits.

Note that downgradient wells GWA-36A, GWA-36RA, GWA-37, and GWA-38 are referenced as GWC wells, as shown above, similar to neighboring downgradient wells. Well GWC-36A was originally installed as a replacement well for upgradient well GWA-36, which was abandoned due to a damaged well casing in 2022, but has been redesignated as a downgradient well. Data from 2022 onward for well GWC-36A are eligible to be used for statistical analyses.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Senior Statistician and Founder of Groundwater Stats Consulting. The analysis was prepared according to the recommended statistical methodology provided in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting and primary author of the USEPA Unified Guidance. In 2025, Georgia Power Company completed a data audit and migration of all CCR related groundwater data to the EarthSoft EQuIS Database Management Program (EQuIS). Data were then exported from EQuIS to Groundwater Stats Consulting (GSC) for use in completing this statistical analysis. Georgia Power Company contracted an independent third-party consultant, Environmental Resources Management (ERM), to support the data audit and migration to EQuIS. Based on the results of the audit and statistical analysis results from GSC, EQuIS will now be used by Georgia Power Company and its third-party geologists and engineers for management of data imported by independent third-party laboratories and data exported by Georgia Power Company and its Consultants. The data will be used in preparation of report submittals, modeling, strategic planning, and other purposes appropriate and consistent with EQuIS's data management and reporting tools and capabilities.

The constituents listed below are evaluated in this report. The terms "parameters" and "constituents" are interchangeable.

- **CCR Appendix III:** boron, calcium, chloride, fluoride, pH, sulfate, and total dissolved solids (TDS)
- **Georgia Appendix I EPD:** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix I well/constituent pairs with 100% non-detects follows this letter.

Time series plots for all well/constituent pairs are provided and are particularly useful for screening parameters detected in downgradient wells which require statistical analyses (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Due to varying detection limits in background data sets, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contains varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case.

Summary of Statistical Methods:

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the update to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following statistical methods:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan
- # Constituents: 16
- # Downgradient wells: 30

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan
- # Constituents: 7
- # Downgradient wells: 30

Parametric prediction limits, tolerance limits, and confidence intervals are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, nonparametric tests are constructed.

While the annual false positive rate associated with parametric prediction limits is fixed at 10% as recommended by the EPA Unified Guidance (2009), the false positive rate associated with nonparametric prediction limits is not fixed and depends upon the

available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits as appropriate. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits, tolerance limits, and confidence intervals are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, the earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to variation in groundwater quality. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, exceedances may occur as a result of variation in groundwater quality rather than facility impacts. A second step can be used

to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from variation in groundwater quality. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United States Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening Georgia EPD Constituents – Conducted in August 2019

A summary of the initial background screening is provided below for historical purposes. As mentioned earlier, the current monitoring well network is in accordance with the 2024 Minor Modification demonstration.

Outliers Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers for all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trend Testing

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the influence of the trend and reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

Several statistically significant decreasing trends were noted, but adjustments were required only for barium in well GWA-53, copper in well GWA-37, and nickel in well GWC-16R. The magnitudes of all other trends were low relative to the average concentrations at each respective well. However, the decreasing trend for the zinc record at well GWC-16R may require adjustment in the future, if it persists, in order to obtain a more conservative prediction limit. Statistically significant increasing trends were also noted but adjustments to eliminate the trends were required only for barium and zinc in upgradient well GWA-36 because the magnitudes of trends identified for all other well/constituent pairs were low relative to the average concentrations. Truncation of earlier data was based on the assumption that the increasing trend was not the result of the facility. A summary of the background date ranges used for well/constituent pairs was submitted with the screening.

Summary of Appendix I & Appendix III Background Screening & Update – Conducted in December 2025

Mann-Whitney Test & Trend Tests – Upgradient Well GWA-3A

During the Spring 2025 report, a minimum of 8 background samples had been collected from new well GWA-3A since March 2021; therefore, the Mann-Whitney test was used to compare historical observations through March 2020 collected from well GWA-3 to newer observations through August 2024 from replacement well GWA-3A for Appendix I and III constituents. The Mann-Whitney test is a two-sample test which evaluates the medians of the background and compliance data to determine whether the medians are statistically significantly different. Statistically significant differences were identified for the following constituents:

- barium, calcium, chloride, copper, nickel, pH, sulfate, TDS, and zinc

Note that an additional Mann-Whitney test was run for calcium during the Fall 2025 report and a statistically significant difference was identified (Figure C). In cases where statistically significant differences were identified at the 99% confidence level, the historical records from well GWA-3 were truncated so that only data from replacement well GWA-3A are used in construction of intrawell and interwell prediction limits for Appendix I and III constituents. An exception includes the record for barium at well GWA-3A because, while the Mann-Whitney test identified statistically significant differences in medians, the more recent concentrations are within the range of historic concentrations from well GWA-3. Additionally, higher measurements earlier in the record remain flagged as outliers for barium at well GWA-3 and are not included in construction

of statistical limits. A list of well/constituent pairs using a truncated portion of their record follows this report.

Outlier Analysis

Prior to updating background data, all Appendix I and III data were evaluated for the purpose of updating background data sets. Tukey's outlier test and visual screening were used to evaluate data for all wells and constituents through August/September 2025 (Figure D). Tukey's test identified several potential outliers and confirmed previously flagged values. Observations were identified by Tukey's and flagged in the database during this report for the following well/constituent pairs:

- Antimony: GWA-41R (upgradient)
- Barium: GWC-23R
- Calcium: GWC-38
- Sulfate: GWA-40 (upgradient)
- TDS: GWC-26

Any values identified by Tukey's, but not flagged in the database, appeared representative of remaining concentrations among the respective records or flagging these values would not drastically impact resulting statistical limits. Additionally, the highest values that were not identified by Tukey's test for the following well/constituent pairs were flagged as outliers to reduce variation among background datasets, which results in statistical limits that are conservative (in most cases, lower) from a regulatory perspective:

- Beryllium: GWC-36RA
- Calcium: GWC-26
- Cobalt: GWC-38
- TDS: GWA-50 (upgradient)

Previously flagged outliers for cobalt at GWC-38, sulfate at GWC-25R, and zinc at GWA-2R were unflagged as these observations were similar to more recent concentrations within each respective record. Any flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. The Appendix I and III outliers are included in the outlier summary following this letter (Figure D).

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells (Figure E). The ANOVA assists in identifying the most appropriate statistical approach. Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation or when statistical limits constructed from pooled upgradient well data are not representative of the current groundwater quality at downgradient wells for a given parameter. The ANOVA identified variation for all Appendix I & III parameters except for copper, mercury, and vanadium. A summary table of the ANOVA results is included with the reports. All parameters were further evaluated as described for the appropriateness of intrawell testing to accommodate the groundwater quality.

Eligibility of Intrawell Methods

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are conservative (i.e., lower) from a regulatory perspective, and that will rapidly identify a change in more recent compliance data within each well. This statistical method removes the element of spatial variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility. Prior to performing intrawell prediction limits, several steps are required to reasonably demonstrate downgradient groundwater quality does not have existing impacts from the practices of the facility.

Exploratory data analysis was used for all Appendix I and III parameters as a general comparison of concentrations in downgradient wells to concentrations reported in upgradient wells. Upper tolerance limits constructed on pooled upgradient well data are used in conjunction with confidence intervals constructed from each downgradient well

to determine whether the estimated averages in downgradient wells are higher than observed levels upgradient of the facility. The upper tolerance limits were constructed to represent the extreme upper range of possible background levels at the site. Two-sided tolerance limits are included for pH and represent both the upper and lower ranges of possible measurements in background wells.

In cases where downgradient average concentrations in at least one well are higher than observed concentrations upgradient for a given constituent where intrawell analyses are recommended, an independent study and hydrogeological investigation would be required to identify local geochemical conditions and expected groundwater quality for the region to justify an intrawell approach. Such an assessment is beyond the scope of services provided by Groundwater Stats Consulting. When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells, interwell prediction limits will initially be selected for the statistical method until further evidence shows that concentrations are due to variation rather than a result of the facility.

Upper Tolerance Limits

Interwell upper tolerance limits (UTLs) were calculated using pooled upgradient well data through August/September 2025 (Figure F). Parametric tolerance limits were constructed with a target of 99% confidence and 95% coverage using pooled upgradient well data for each of the Appendix I & III parameters. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. As more data are collected, the background population is better represented and the confidence and coverage levels for nonparametric tolerance limits increase. Note that both an upper and lower tolerance limit was constructed for pH to test both upper and lower limits. A summary of tolerance limits follows this report.

Confidence Intervals

Confidence intervals were constructed on downgradient wells for each of the Appendix I & III parameters for comparison to the upper tolerance limits (i.e., sitewide background limits) to determine intrawell eligibility. These intervals were constructed as either parametric or nonparametric confidence intervals depending on the data distribution and percentage of non-detects. When data followed a normal or transformed-normal distribution, parametric confidence intervals were constructed. Nonparametric confidence intervals, which use the appropriate order statistics depending on the sample size as interval limits, were constructed when data did not follow a normal or transformed-normal distribution or when there were greater than 50% non-detects. The lower confidence limit,

which is constructed with 99% confidence for parametric confidence intervals, is compared to the upper tolerance limits as described above. The achievable confidence level associated with nonparametric confidence intervals is dependent upon the number of samples available.

When the entire confidence interval is above a background standard for a given parameter using the tolerance limits discussed above, interwell methods are initially recommended as the statistical method. Therefore, only parameters with no confidence interval exceedances are eligible for intrawell prediction limits. Note that well/constituent pairs with 100% non-detects were deselected prior to construction of confidence intervals.

Results of the confidence intervals follow this report (Figure G). While the Sanitas software identified confidence interval exceedances for cadmium and thallium among Appendix I & III parameters, the upper and lower limits of each nonparametric confidence interval, which resulted from the high percentage of non-detects in each record, were based on the reporting limits and are equal to the upper tolerance limits. Therefore, no SSLs were declared for either constituent, and intrawell prediction limits are recommended for all Appendix I and III constituents.

Trend Tests – Intrawell

While trends can be identified by visual inspection, a quantification of the trend and its statistical significance is needed. The Sen's Slope/Mann Kendall trend test was used to evaluate all data at each well through February/March 2025 to identify statistically significant increasing or decreasing trends at the 99% confidence level (Figure H). In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different than current reported concentrations and are deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits. The following statistically significant trends were identified at upgradient wells:

Increasing

- Antimony: GWC-16R
- Barium: GWA-2R, GWA-4RZ (both upgradient), and GWC-36RA
- Calcium: GWA-2R, GWA-4RZ, GWA-42, GWA-43R (all upgradient), GWC-16R, GWC-19R, GWC-21R, GWC-22R, GWC-23R, GWC-29, and GWC-36RA
- Chloride: GWA-3A (upgradient) and GWC-38
- Cobalt: GWA-4RZ (upgradient)
- Fluoride: GWC-18 and GWC-28
- Sulfate: GWC-21R, GWC-23R, GWC-25R, GWC-31, and GWC-36RA
- TDS: GWA-3A (upgradient), GWC-16R, GWC-23R, and GWC-36RA
- Thallium: GWC-18 and GWC-20R
- Zinc: GWA-39RZ, GWA-43 (both upgradient), GWC-17R, GWC-18, GWC-19R, GWC-20R, GWC-21R, GWC-22R, and GWC-23R

Decreasing

- Antimony: GWA-2R (upgradient)
- Arsenic: GWC-22R
- Barium: GWA-1, GWA-41, GWA-43, GWA-43R, GWA-50, GWA-50R (all upgradient), GWC-17R, GWC-18, GWC-19R, and GWC-37
- Boron: GWA-43R (upgradient)
- Calcium: GWA-43, GWA-50, GWA-50R (all upgradient), and GWC-37
- Chloride: GWA-1, GWA-39RZ, GWA-39Z, GWA-41, GWA-41R, GWA-43R, GWA-50, GWA-50R (all upgradient), GWC-17R, GWC-22R, GWC-24R, GWC-25R, GWC-32, GWC-37, and GWC-57
- Chromium: GWC-18
- Cobalt: GWA-2R (upgradient), GWC-22R, and GWC-38
- Copper: GWA-50, GWA-50R (both upgradient), and GWC-37
- Fluoride: GWA-4RZ (upgradient)
- Nickel: GWA-50R (upgradient), and GWC-16R
- pH: GWA-1, GWA-2R, GWA-4RZ, GWA-40, GWA-41R, GWA-43, GWA-50, GWA-50R (all upgradient), GWC-16R, GWC-22R, GWC-23R, GWC-36RA, GWC-37, and GWC-38
- Silver: GWA-50R (upgradient)
- Sulfate: GWA-1, GWA-39RZ, GWA-39Z, GWA-43R, GWA-50R (all upgradient), GWC-18R, and GWC-22R
- TDS: GWA-43 (upgradient) and GWC-17R
- Zinc: GWC-16R

Truncation of earlier data reported in upgradient well records, in particular, to remove trends should be done with caution since similar concentrations could appear at downgradient wells in the absence of facility impacts. Several statistically significant trends were identified. In most cases, the significant trends did not substantially affect resulting intrawell prediction limits as more recent concentrations were within the range of observations reported earlier in the records. Additionally, for significant trends identified among downgradient wells, the concentrations were lower than those reported at one or more wells upgradient of the facility. Other statistically significant trends were a byproduct of several non-detects either early or late in the record rather than values detected above the reporting limit.

Exceptions to the cases discussed above are the following well/constituent pairs:

- Barium: GWA-1, GWA-4RZ, and GWA-50R (all upgradient)
- Calcium: GWA-43, GWA-50R (both upgradient)
- Copper: GWA-50R (upgradient)
- Nickel: GWA-50R (upgradient), and GWC-16R
- Sulfate: GWA-39RZ and GWA-39Z (both upgradient)
- TDS: GWC-23R
- Zinc: GWC-16R

For most of these cases, the earlier concentrations were deselected to remove the influence of the trend and construct statistical limits representative of current conditions and capable of readily detecting changes in groundwater quality. These records for these well/constituent pairs were updated through February/March 2025. An exception is for TDS at downgradient well GWC-23R which was not updated with more recent observations at this time to maintain a statistical limit that is conservative (i.e., lower) from a regulatory perspective. All records will be re-evaluated during the next background update. If newer observations for TDS at well GWC-23R remain at relatively stable concentrations, then the record may be updated.

Evaluation of Georgia EPD Appendix I Constituents – September 2025

Intrawell Prediction Limits

Intrawell limits constructed from screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective

background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to spatial variation rather than a result of practices at the landfill. Further validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of variation rather than impacts of the landfill.

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available historical data through February/March 2025, except for the cases mentioned above and listed in the Date Range summary following this letter, within each well with detections (Figure I). As discussed earlier, intrawell prediction limits are not constructed on upgradient wells GWA-51RZ, GWA-52, GWA-53, GWA-53R, GWA-54, GWA-55, GWA-55R, and GWA-56 as these wells were abandoned in 2022. No statistical analyses were included for well/constituent pairs with 100% non-detects and a list of these well/constituent pairs follows this report.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of the Georgia EPD Appendix I prediction limits follows this report. Exceedances were identified for the following well/constituent pairs:

- Barium: GWC-20R and GWC-28

Two-Step Analysis

When apparent intrawell prediction limit exceedances are identified among downgradient wells, interwell prediction limits are constructed using pooled upgradient well data following the two-step analysis as described above. Following the two-step analysis as described above, an interwell prediction limit was then constructed using pooled upgradient well data through August/September 2025 to evaluate the apparent intrawell

prediction limit exceedances for barium among downgradient wells (Figure J). No exceedances were identified.

Trend Tests

When data from downgradient well/constituent pairs found to exceed their respective prediction limits, all available data were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure K). Complete graphical results of the trend tests follow this letter. Statistically significant trends were identified for the following well/constituent pairs:

Increasing

- Barium: GWA-2R, GWA-4RZ, and GWA-56 (all upgradient)

Decreasing

- Barium: GWA-1, GWA-40, GWA-41, GWA-43, GWA-43R, GWA-50, GWA-50R, GWA-52, GWA-53, and GWA-55R (all upgradient)

Evaluation of Appendix III Parameters – August/September 2025

Intrawell Prediction Limits

For Appendix III parameters, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through February/March 2025 (Figure L). The August/September 2025 sample from each well was compared to its respective background limit to determine whether exceedances over background are present. No statistically significant increases were identified among downgradient wells. The following intrawell prediction limit exceedance was identified upgradient of the facility:

- Calcium: GWA-43R (upgradient)

When prediction limit exceedances are identified upgradient of the facility, it is an indication of changing groundwater quality unrelated to practices at the landfill.

Two-Step Analysis

Following the two-step analysis as described above, no initial exceedances were found among downgradient wells; therefore, no further action was required.

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limit for both intrawell and interwell methods were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure J). Since no exceedances were identified among downgradient wells; no further action was required.

Summary

Based on the results of the Appendix I and III constituents requiring intrawell prediction limits, as well as interwell prediction limits for apparent intrawell prediction limit exceedances at downgradient wells according to the Two-Step Approach, no prediction limit exceedances were identified in any of the downgradient wells. Below is a summary of the prediction limit exceedances:

Appendix I

- None

Appendix III

- Calcium: GWA-43R (upgradient)

Non-Parametric ANOVA

Constituent: Antimony Analysis Run 12/11/2025 11:40 AM View: ANOVA
Plant Bowen Client: Southern Company Data: Bowen LF 3-8

For observations made between 8/23/2007 and 9/3/2025, the non-parametric analysis of variance test indicates a DIFFERENCE between the medians of the groups tested at the 5% significance level. Because the calculated Kruskal-Wallis statistic is greater than the Chi-squared value, we conclude that at least one group has a significantly different median concentration of this constituent when compared to another group.

Calculated Kruskal-Wallis statistic = 119.4

Tabulated Chi-Squared value = 33.924 with 22 degrees of freedom at the 5% significance level.

There were 41 groups of ties in the data, consequently the Kruskal-Wallis statistic (H) was adjusted. The adjusted statistic (H') was utilized to determine if the medians were equal.
