Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 25 background values. Well-constituent pair annual alpha = 0.005656. Individual comparison alpha = 0.002832 (1 of 2).

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

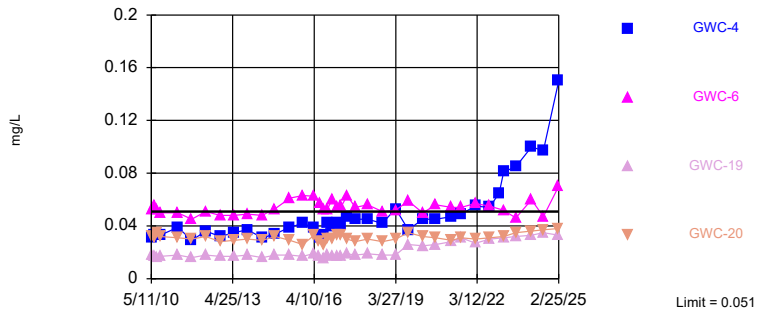
Exceeds Limit: GWC-4, GWC-6

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 114 background values. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

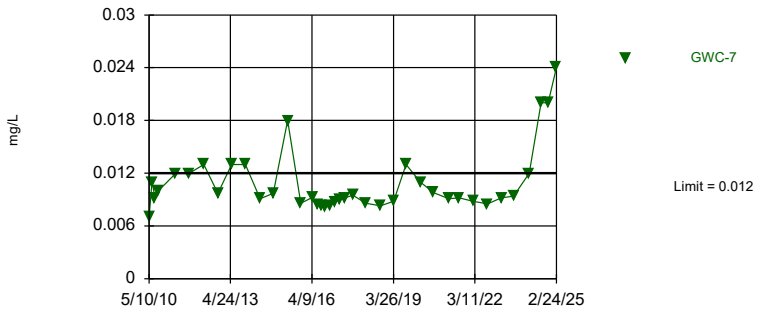
Constituent: Barium Analysis Run 6/18/2025 4:30 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-7

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 114 background values. 30.7% NDs. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Assumes 16 future values.

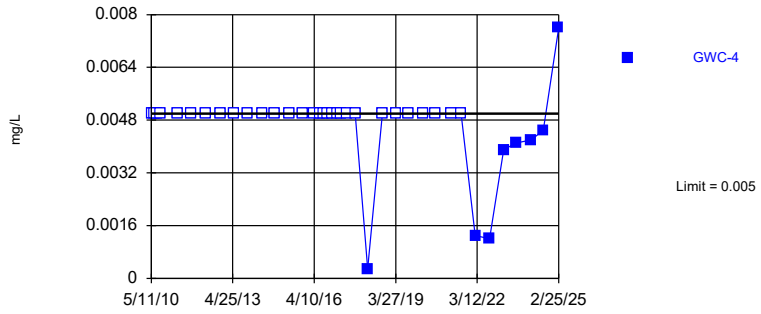
Constituent: Chromium Analysis Run 6/18/2025 4:30 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 114 background values. 94.74% NDs. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Assumes 16 future values.

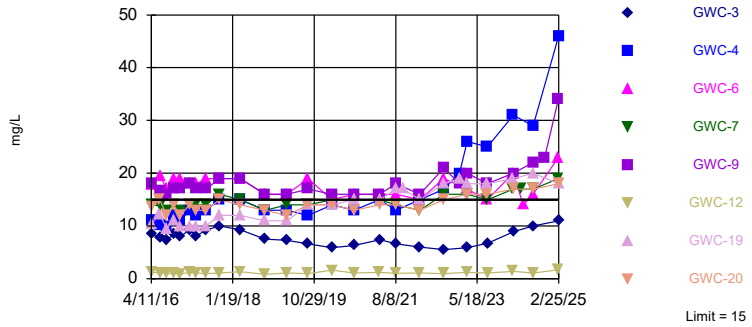
Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4, GWC-6, GWC-7, GWC-9, GWC-19, GWC-20

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 72 background values. Annual per-constituent alpha = 0.01226. Individual comparison alpha = 0.0003627 (1 of 2). Comparing 8 points to limit. Assumes 9 future values.

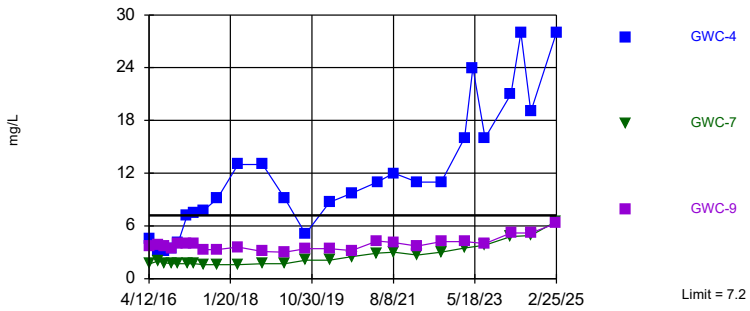
Constituent: Calcium Analysis Run 8/12/2025 1:20 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 72 background values. Annual per-constituent alpha = 0.01226. Individual comparison alpha = 0.0003627 (1 of 2). Comparing 3 points to limit. Assumes 14 future values.

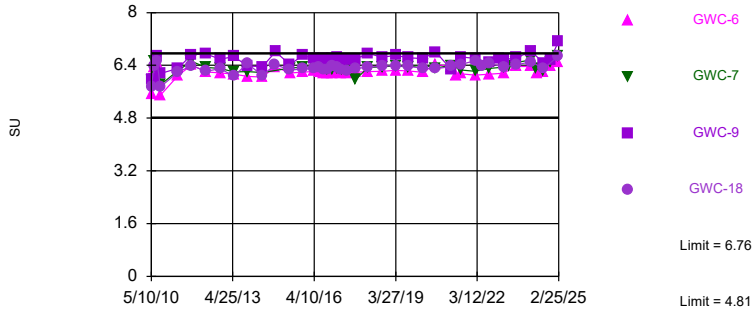
Constituent: Chloride Analysis Run 8/12/2025 1:20 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limits: GWC-9

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 115 background values. Annual per-constituent alpha = 0.01006. Individual comparison alpha = 0.0002967 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

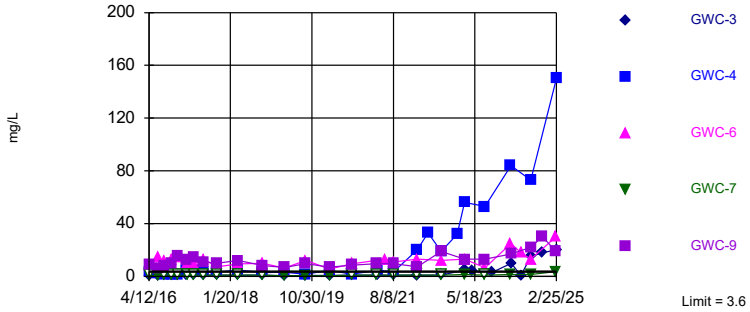
Constituent: pH, Field Analysis Run 8/12/2025 1:20 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-3, GWC-4, GWC-6, GWC-9

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 72 background values. 63.89% NDs. Annual per-constituent alpha = 0.01226. Individual comparison alpha = 0.0003627 (1 of 2). Comparing 5 points to limit. Assumes 12 future values.

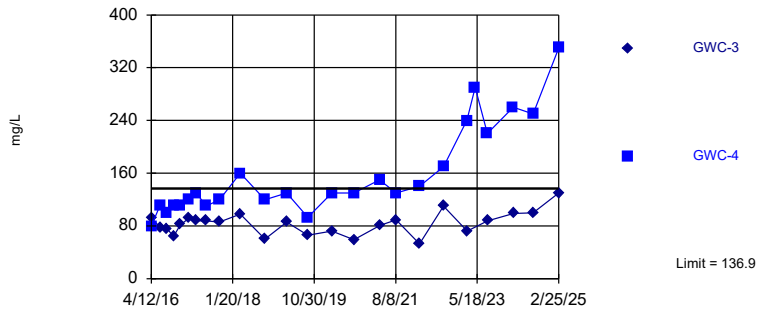
Constituent: Sulfate Analysis Run 8/12/2025 1:20 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

Interwell Parametric



Background Data Summary: Mean=71.76, Std. Dev.=30.7, n=72, 2.778% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.982, critical = 0.954. Kappa = 2.123 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004426. Comparing 2 points to limit. Assumes 15 future values.

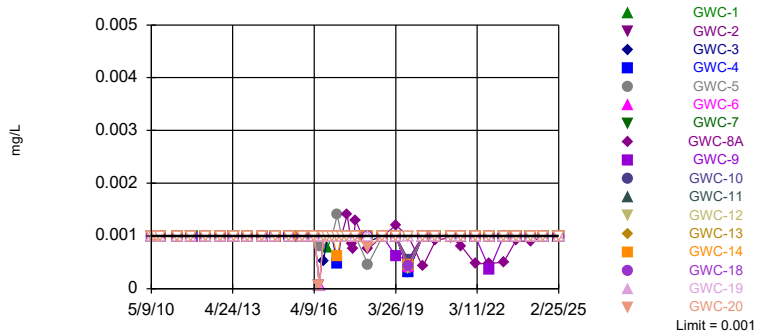
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 114 background values. 96.49% NDs. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Comparing 17 points to limit.

Constituent: Arsenic Analysis Run 6/18/2025 4:32 PM View: Appendix I - Interwell

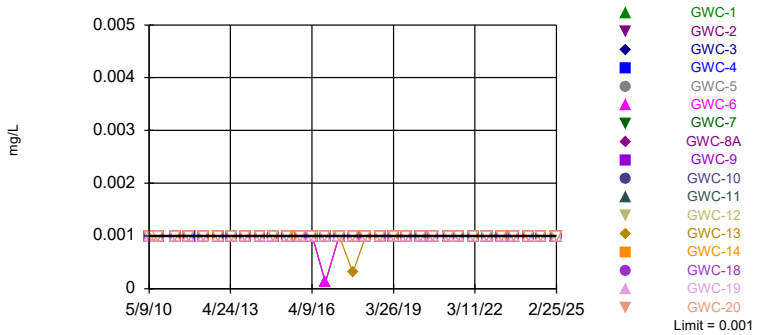
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 99) were censored; limit is most recent reporting limit. Annual per-constituent alpha = 0.006628. Individual comparison alpha = 0.0001956 (1 of 2). Comparing 17 points to limit.

Within Limits

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 40 background values. Well-constituent pair annual alpha = 0.004632. Individual comparison alpha = 0.002317 (1 of 2).

Constituent: pH, Field Analysis Run 6/19/2025 9:27 AM View: Appendix III - Intrawell Resample

Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

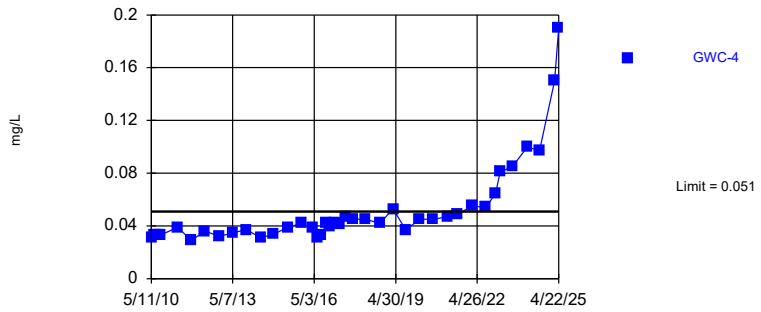
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 114 background values. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Assumes 16 future values.

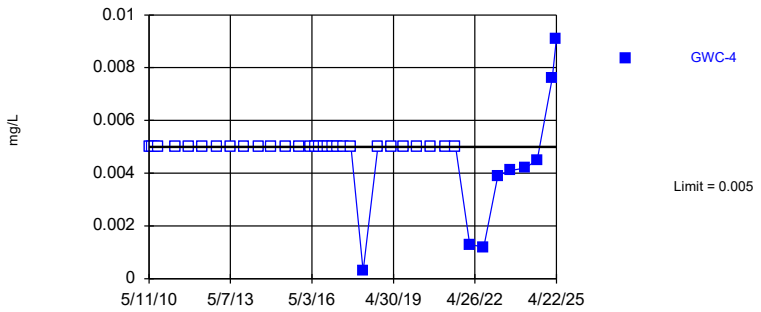
Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 114 background values. 94.74% NDs. Annual per-constituent alpha = 0.005128. Individual comparison alpha = 0.0001512 (1 of 2). Assumes 16 future values.

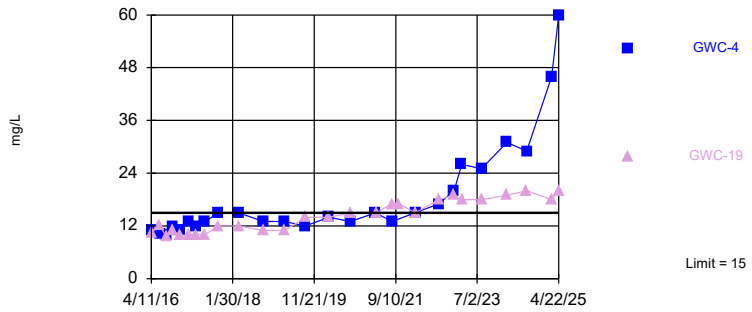
Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4, GWC-19

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 72 background values. Annual per-constituent alpha = 0.01226. Individual comparison alpha = 0.0003627 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

Constituent: Calcium Analysis Run 6/19/2025 9:31 AM View: Appendix III - Interwell Two-Step Resample

Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
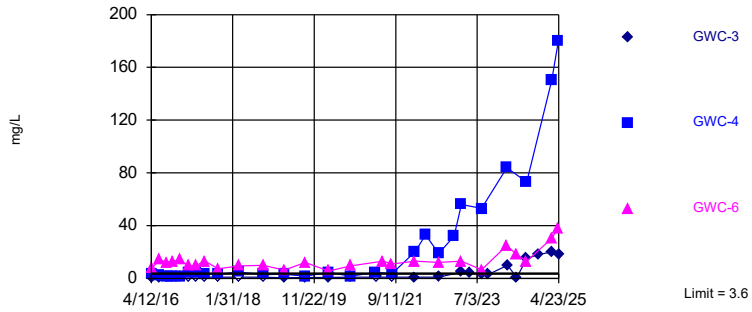
Hollow symbols indicate censored values.

Exceeds Limit: GWC-3, GWC-4, GWC-6

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 72 background values. 63.89% NDs. Annual per-constituent alpha = 0.01226. Individual comparison alpha = 0.0003627 (1 of 2). Comparing 3 points to limit. Assumes 14 future values.

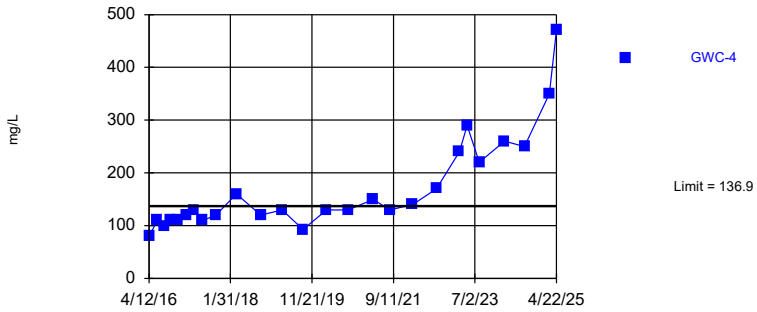
Constituent: Sulfate Analysis Run 6/19/2025 9:31 AM View: Appendix III - Interwell Two-Step Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

Interwell Parametric



Background Data Summary: Mean=71.76, Std. Dev.=30.7, n=72, 2.778% NDs. Normality test: Shapiro Francia @alpha = 0.01, calculated = 0.982, critical = 0.954. Kappa = 2.123 (c=7, w=17, 1 of 2, event alpha = 0.05132). Report alpha = 0.007498. Individual comparison alpha = 0.0004426. Assumes 16 future values.

GROUNDWATER STATS CONSULTING

August 29, 2025

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer PAC Landfill
Background Update & Statistical Analysis – February 2025

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the background update and groundwater statistical analysis for the 2025 1st Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer PAC Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, Environmental Protection Division (Georgia EPD) groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-21, GWA-22, GWA-45, GWA-46, GWA-47, GWA-48, and GWA-49
- **Downgradient wells:** GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance. In 2024, Georgia Power Company completed a data audit and migration of all CCR related groundwater data to the EarthSoft EQuIS Database Management Program (EQuIS). Data were then exported from EQuIS to Groundwater Stats Consulting (GSC) for use in completing this statistical analysis. Georgia Power Company contracted an independent third-party consultant, Environmental Resources Management (ERM), to support the data audit and migration to EQuIS. Based on the results of the audit and statistical analysis results from GSC, EQuIS will now be used by Georgia Power Company and its third-party geologists and engineers for management of data imported by independent third-party laboratories and data exported by Georgia Power Company and its Consultants. The data will be used in preparation of report submittals, modeling, strategic planning, and other purposes appropriate and consistent with EQuIS's data management and reporting tools and capabilities.

Resamples were collected in November 2022 for TDS at wells GWA-45, GWA-46, GWA-47, GWA-48, GWA-49, GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53 due to the August 2022 samples and October 2022 resamples being out of holding times. Per request of WSP, the samples that exceeded hold times for TDS are not included in the Sanitas database. Resamples were also collected for pH at these wells in October and November 2022 and all pH samples were retained in the database.

The following constituents were evaluated:

- **CCR Appendix III -** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I -** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the cases of cobalt, fluoride, and zinc, the current reporting limits of 0.0025 mg/L, 0.1 mg/L, and 0.005 mg/L were substituted for all wells to maintain statistical limits that are conservative from a regulatory perspective.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided during the background update discussed below to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 15 (silver was 100% non-detects in all downgradient wells)
- # Downgradient wells: 5

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 5

Statistical analyses are not required when 100% non-detects are present in downgradient wells for a given constituent; therefore, no prediction limits were required for silver. A summary of all Appendix I well/constituent pairs with 100% non-detects follows this letter.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of current groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells.

Intrawell methods use background data for individual wells and may be overly sensitive to spatial variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, a large number of exceedances may occur as a result of spatial variation rather than facility impacts.

A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resamples confirm the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant

increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical background data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient background water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening Georgia EPD Appendix I - Conducted in August 2019

Outlier and Trend Testing

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trends

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations and, therefore, required no adjustments. It was noted that several of the upgradient wells had higher reported measurements in the earliest part of the records for some of the metals. These values were not deselected at this time since the measurements serve as reference data upgradient of the facility. If similar measurements are observed at a later time in one or more downgradient wells, the earlier upgradient data may indicate that the change is occurring rather than a result of practices at the facility. While there was an overall increasing trend in concentrations for cobalt at well GWC-53, data are highly variable and similar to concentrations that have historically been reported in upgradient well GWA-45. Therefore, no adjustment was made to this record at that time.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach.

Generally, constituents without significant differences, based on ANOVA across upgradient wells, may be considered for interwell analysis. However, the Scherer PAC Landfill is lined, and pre-waste data are available that show metals were present in low level detections during the collection of background data. Furthermore, for some constituents, the reported concentrations are higher in upgradient wells than in downgradient wells. This would result in interwell limits that would not readily detect changes in the downgradient wells with lower concentrations. Therefore, intrawell prediction limits are recommended as the most appropriate statistical analysis for all of the Georgia EPD constituents at this landfill.

Summary of Background Updates – Georgia EPD Appendix I and CCR Appendix III

June 2021 & May 2023

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells through September 2020. All of the more recent compliance measurements appeared stable compared to the previously screened historical data sets; therefore, no new outliers were flagged except for a high value for lead (0.0034 mg/L) in well GWC-52 in order to maintain conservative (i.e., lower) statistical limits, along with a historic high value for vanadium in upgradient well GWA-47 (0.041 mg/L). Due to an increasing trend for barium at upgradient well GWA-45, observations between September 2019 and April 2021 were also flagged. A summary of all flagged outliers follows this letter. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents in this instance), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data to the new compliance samples at each well. When no variation is present between historical data and compliance samples,

the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was included in the background update report. When the medians of the two groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. Note that historical data prior to 2016 for lead were truncated at all wells so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective during the June 2021 background update. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods were re-evaluated during the next background update.

April 2025

Outlier Analysis

Prior to updating background data, visual screening and Tukey's outlier test was used to evaluate data for suspected outliers in upgradient and downgradient wells through August/November 2024. Previously flagged values were confirmed either by Tukey's test or visual screening except for chromium at GWA-45 and vanadium at upgradient wells GWA-21, GWA-22, GWA-45, and GWA-48 since the concentrations were not identified by Tukey's and were similar to remaining values within the respective records. Additionally, as a result of the data received from the EQUIS database, some of the reported measurements at downgradient well GWC-53 for pH and vanadium were different from those historically used in the Sanitas database; therefore, these values are no longer flagged as outliers. Values identified by Tukey's test and flagged during this analysis include the highest values for calcium at downgradient well GWC-50, chloride at downgradient wells GWC-50 and GWC-53, cobalt at upgradient well GWA-45, sulfate at downgradient well GWC-53, and TDS at downgradient well GWC-50. Although not identified by Tukey's outlier test, the highest observations in each respective record for boron, sulfate, and zinc at well GWC-50, and chloride and sulfate at well GWA-45 were flagged in order to reduce variation and construct statistical limits that are capable of readily detecting changes in groundwater quality.

Any values identified by Tukey's test but not flagged appeared representative of spatial variation or would not result in substantial changes to resulting statistical limits, and these observations will continue to be monitored. The observations flagged with an "O" flag are included in the Outlier Summary (Figure C). Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2022 to the new compliance samples at each well through August/November 2024 (Figure D). When no variation is present between historical data and compliance samples, the Mann-Whitney test is not used. When the medians of the two groups are not statistically significantly different at the 99% confidence level (either an increase or decrease), background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test showed statistically significant differences for the following well/constituent pairs:

Increase:

- Arsenic: GWA-46 and GWA-47 (both upgradient)
- Barium: GWC-29 and GWC-52
- Calcium GWA-47 (upgradient), GWC-29, GWC-51, and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52
- Nickel: GWC-50
- pH: GWC-29
- Sulfate: GWC-51, GWC-52, and GWC-53
- TDS: GWC-52

Decrease:

- Arsenic: GWA-22 (upgradient) and GWC-52
- Calcium: GWA-45 (upgradient)
- Chloride: GWA-22 (upgradient)
- Chromium: GWA-45 (upgradient)
- Nickel: GWC-29
- Sulfate: GWC-29

For both Appendix I and III well/constituent pairs with a statistically significant increase in median concentrations, the records below were not updated with data through August 2024 due to a continuous increase in concentrations among more recent observations. This step results in statistical limits that are capable of readily detecting changes in groundwater quality and the records are as follows:

- Barium: GWC-52
- Calcium: GWC-52
- Chromium: GWC-52
- Sulfate: GWC-52

The remaining records with statistically significant increases were updated through August/November 2024 and are listed below. For upgradient wells, the increasing concentrations are assumed to result from spatial variation and to represent unimpacted background conditions. The increases in downgradient wells appear to be similar to historic concentrations in the same well or resemble concentrations in at least one upgradient well and would have little to no impact on resulting statistical limits:

- Arsenic: GWA-46 and GWA-47 (both upgradient)
- Barium: GWC-29
- Calcium GWA-47 (upgradient), GWC-29, and GWC-51
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52
- Nickel: GWC-50
- pH: GWC-29
- Sulfate: GWC-51 and GWC-53
- TDS: GWC-52

Regarding Appendix I and III well/constituent pairs with a statistically significant decrease in median concentrations, all records were updated with compliance data as observations were either reported non-detects and trace values (i.e., at or below the reporting limit) or were within the range of historic concentrations.

Note that concentrations early in the record for calcium at well GWC-29 and TDS at well GWC-52 were truncated so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Statistical Analysis of Georgia EPD Appendix I Constituents – February 2025

Intrawell limits were constructed for all Georgia EPD Appendix I constituents. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, the current assumption is that the higher downgradient concentrations are due to spatial variation rather than a result of practices at the landfill. The pre-waste data support this logic.

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August/November 2024 within each well for constituents with detections (Figure E). As mentioned above, the Date Range summary provides the period of record used for well/constituent pairs where records have been truncated, the February 2025 compliance samples were compared to these intrawell background limits. As previously discussed, no statistical analyses were included for silver since all records contain 100% non-detects in downgradient wells, or for other individual well/constituent pairs containing 100% non-detects.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary table of the background intrawell prediction limits and exceedances follows this letter, along with the complete graphical results. Statistical exceedances were noted for the following well/constituent pairs:

- Barium: GWC-52
- Chromium: GWC-51 and GWC-52
- Vanadium: GWA-45, GWA-46, GWA-49 (all three upgradient), GWC-50, GWC-51, and GWC-52

Two-Step Analysis

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through February 2025 to evaluate the initial intrawell prediction limit exceedances listed above in downgradient wells (Figure F). No exceedances were identified.

Trend Tests

When initial prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure G). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. Trends in upgradient trends are an indication

of variability in groundwater unrelated to practices at the site. Both a summary and complete graphical results of the trend tests follow this letter. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWA-45, GWA-46 (both upgradient), and GWC-52
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52

Decreasing:

- Barium: GWA-22 (upgradient)

Note that the cause of the trends for barium and chromium at well GWC-52 is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations reflect spatial variation, the earlier portion of the record may require deselection so that resulting limits are reflective of current water quality conditions.

Statistical Analysis of Appendix III Parameters – February 2025

Intrawell prediction limits for all Appendix III parameters, combined with a 1-of-2 resample plan, were constructed using all historical data through August/November 2024 (Figure H). The February 2025 compliance data were compared to those limits.

As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing intrawell prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well.

Prediction Limits

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. A summary table of the Appendix III prediction limits follows this letter, along with complete graphical results. The following prediction limit exceedances were noted for Appendix III parameters:

- Calcium: GWC-52

- Chloride: GWA-48 (upgradient), GWC-51, and GWC-52
- pH (upper limit): GWA-21, GWA-22, GWA-45 (all three upgradient), GWC-29, GWC-51, and GWC-52
- Sulfate: GWC-51, GWC-52, and GWC-53

Two-Step Analysis

Following the two-step analysis procedure as mentioned above, interwell prediction limits were then constructed using pooled upgradient well data through August 2024 to evaluate the apparent initial intrawell prediction limit exceedances listed above at downgradient wells (Figure I). An exceedance was identified for the following well/constituent pair:

- Sulfate: GWC-53

It was noted that upgradient well GWA-45, which is included in the interwell background and represents groundwater quality upgradient of the site, has higher concentrations than neighboring upgradient wells for several of the Appendix III constituents. Therefore, the interwell comparisons for downgradient wells with reported lower concentration levels need to be interpreted cautiously and are further evaluated through trend analysis as described below.

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure J). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary and complete the trend test results follow this letter. The following statistically significant trends were identified:

Increasing:

- Calcium: GWA-46, GWA-47 (both upgradient), and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), and GWC-51
- pH: GWA-46, GWA-47, GWA-49 (all three upgradient), and GWC-29
- Sulfate: GWA-45 (upgradient), GWC-51, GWC-52, and GWC-53

Decreasing:

- Calcium: GWA-21 and GWA-45 (both upgradient)
- Chloride: GWA-22 (upgradient)

Note that the cause of the trends for calcium and sulfate at well GWC-52 is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations reflect spatial variation, the earlier portion of the record may require deselection so that resulting limits are reflective of current water quality conditions.

Summary

Observations from the February 2025 sample event at Scherer PAC were compared to established intrawell prediction limits for all Appendix I and III constituents. For parameters using intrawell prediction limits, the two-step approach followed by trend testing was used to evaluate apparent exceedances. Based on the results of the two-step approach for the February 2025 observations, an exceedance was identified for the following well/constituent pair:

- Sulfate: GWC-53

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer PAC Landfill. If you have any questions or comments, please feel free to contact us.

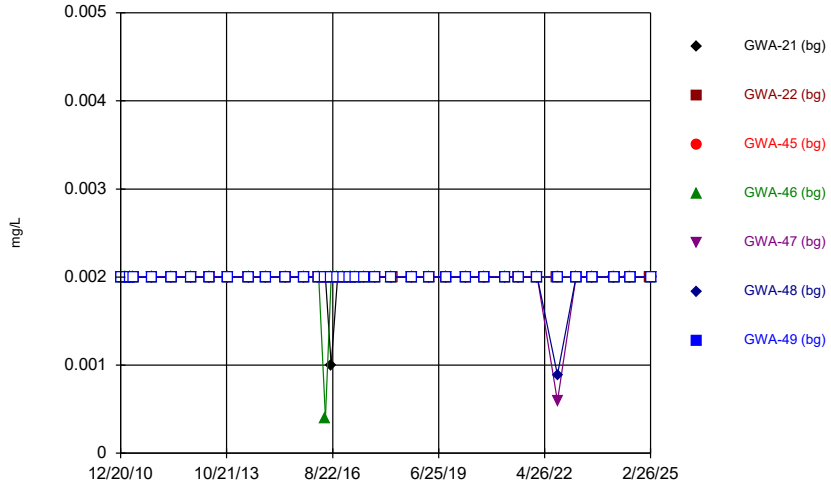
FIGURE A.

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

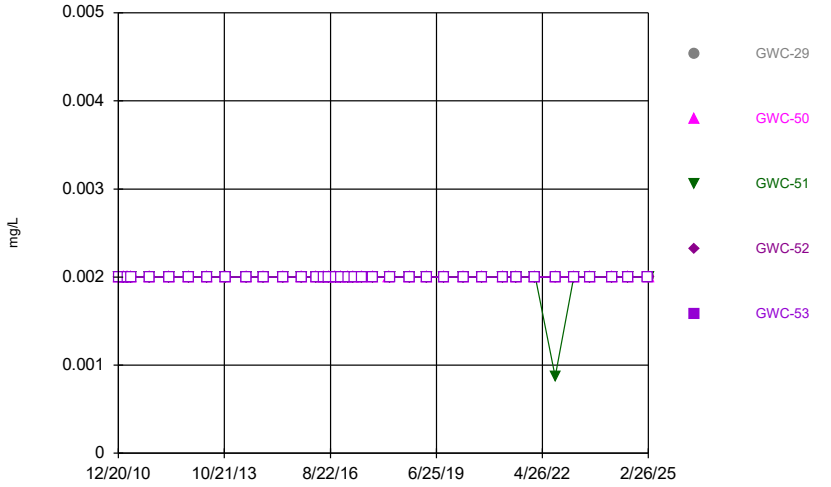
Time Series



Constituent: Antimony Analysis Run 6/10/2025 11:20 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

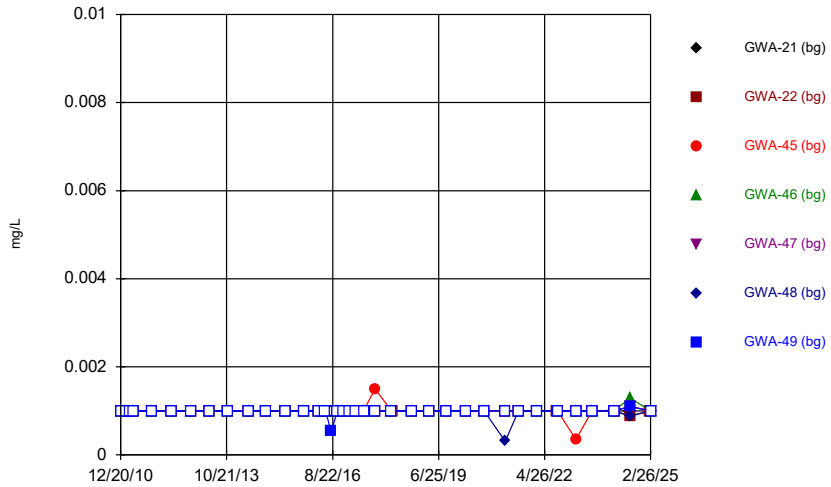
Time Series



Constituent: Antimony Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

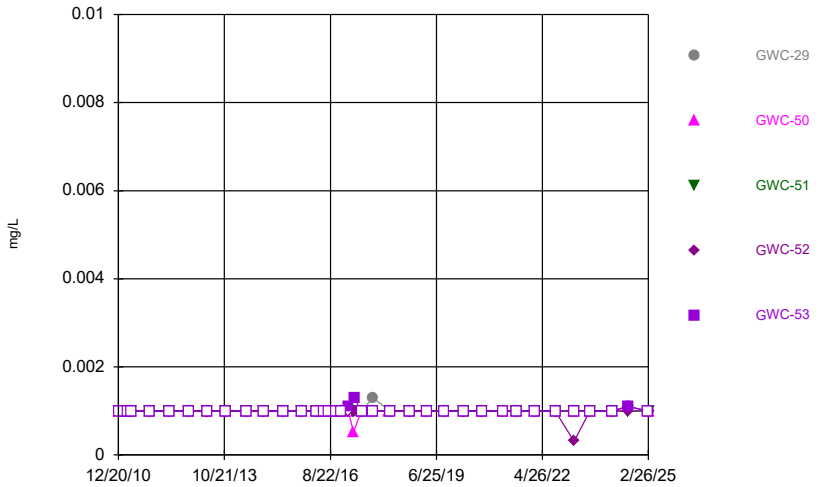
Time Series



Constituent: Arsenic Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

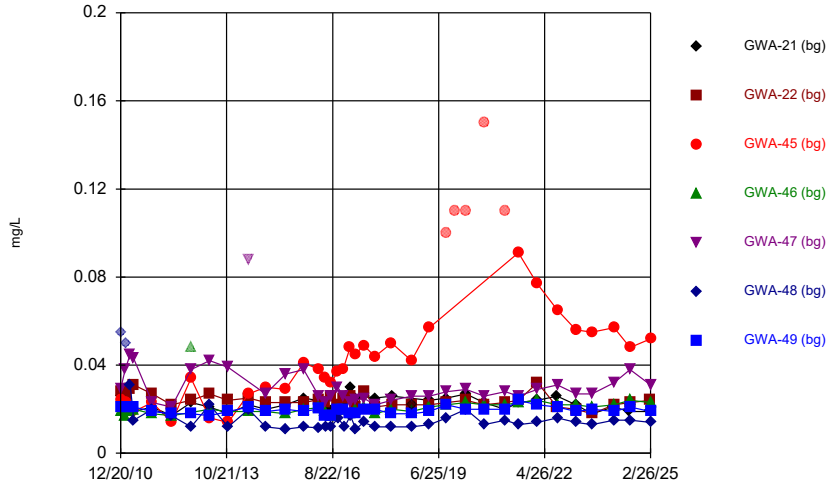
Time Series



Constituent: Arsenic Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

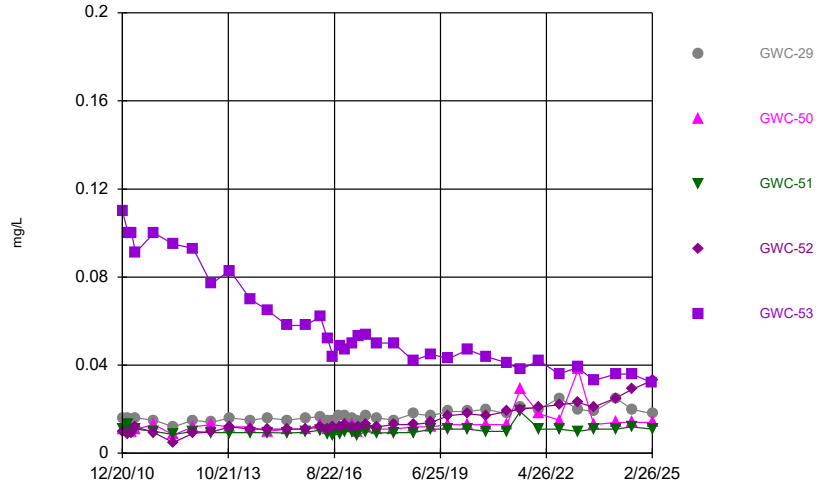


Constituent: Barium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series



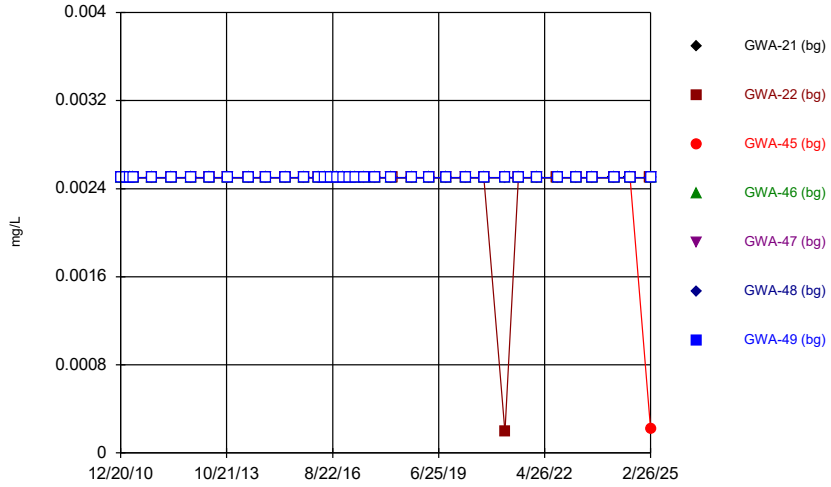
Constituent: Barium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Hollow symbols indicate censored values.

Time Series



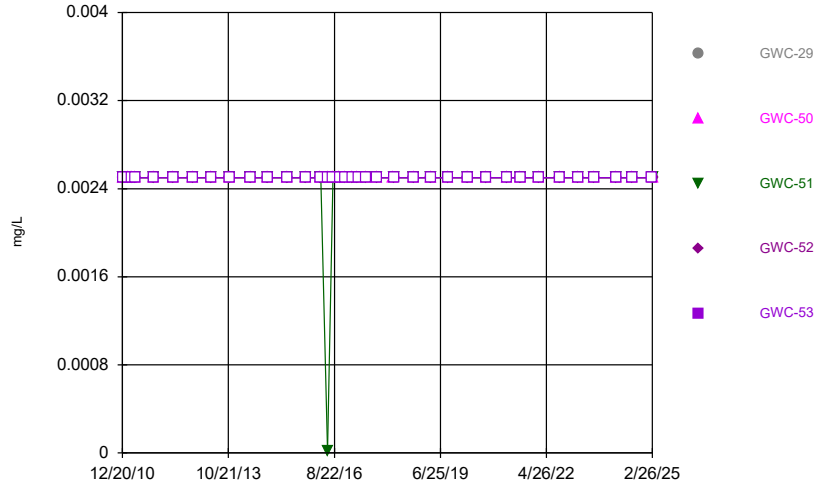
Constituent: Beryllium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Hollow symbols indicate censored values.

Time Series

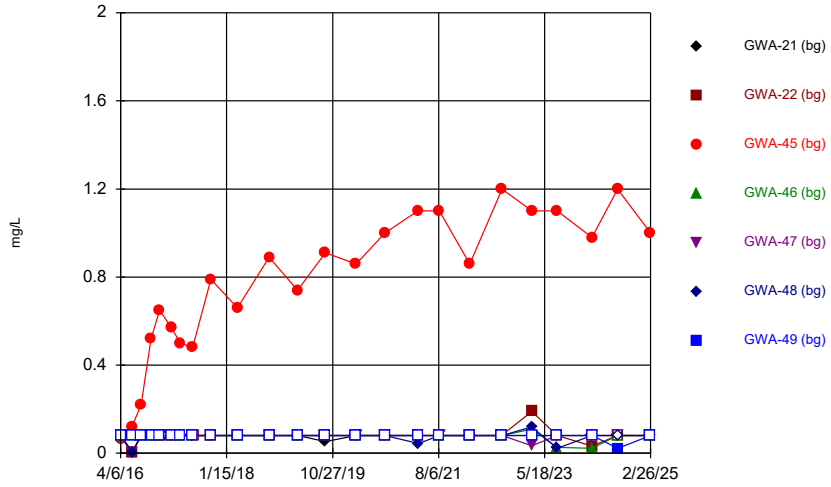


Constituent: Beryllium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

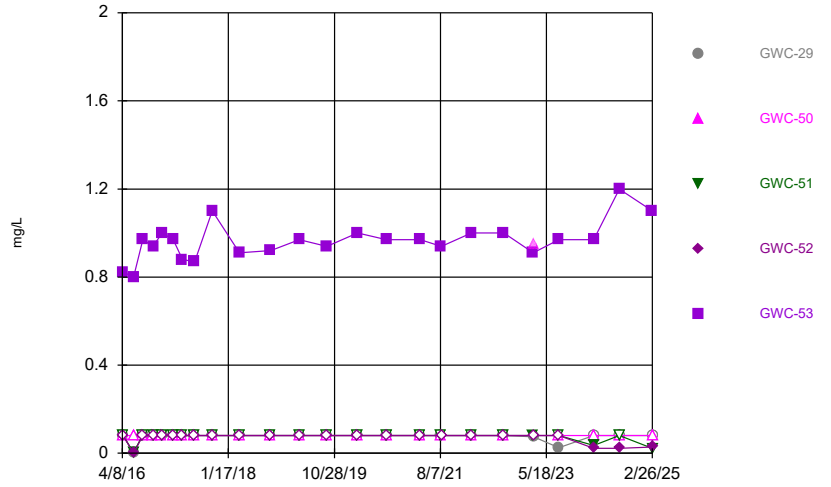
Time Series



Constituent: Boron Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

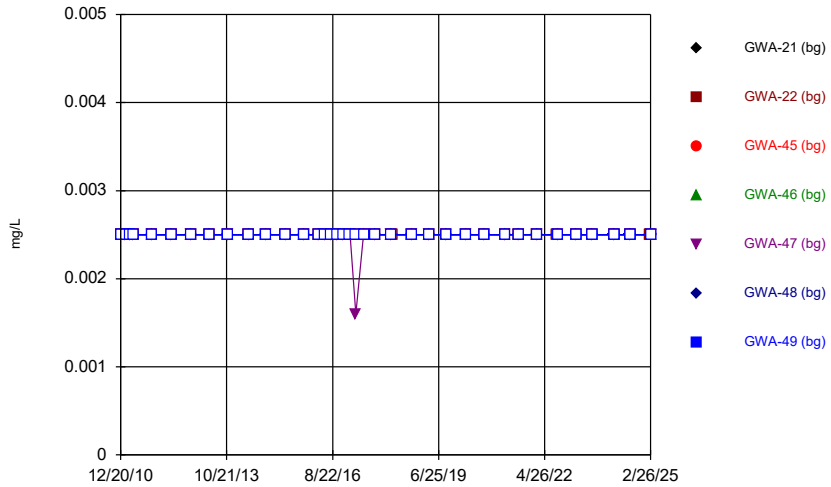
Time Series



Constituent: Boron Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

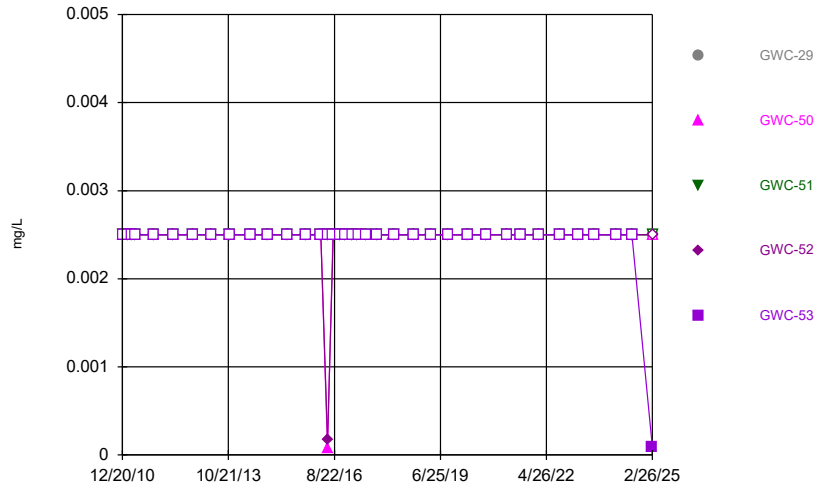
Time Series



Constituent: Cadmium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

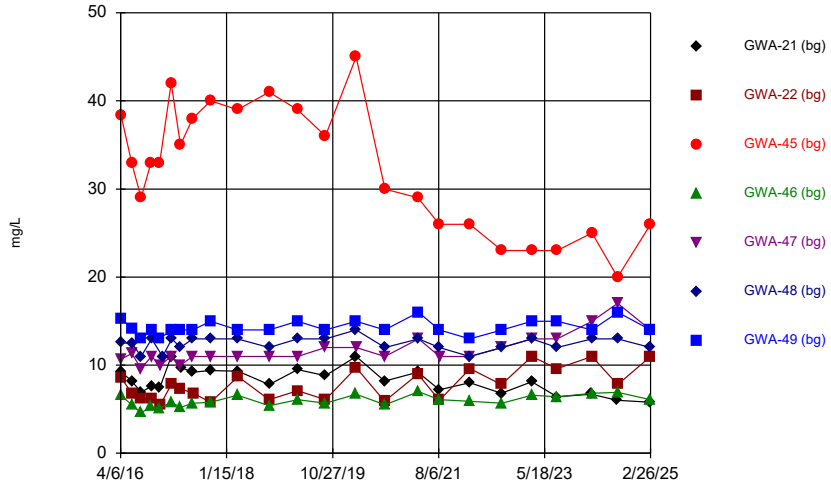
Time Series



Constituent: Cadmium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

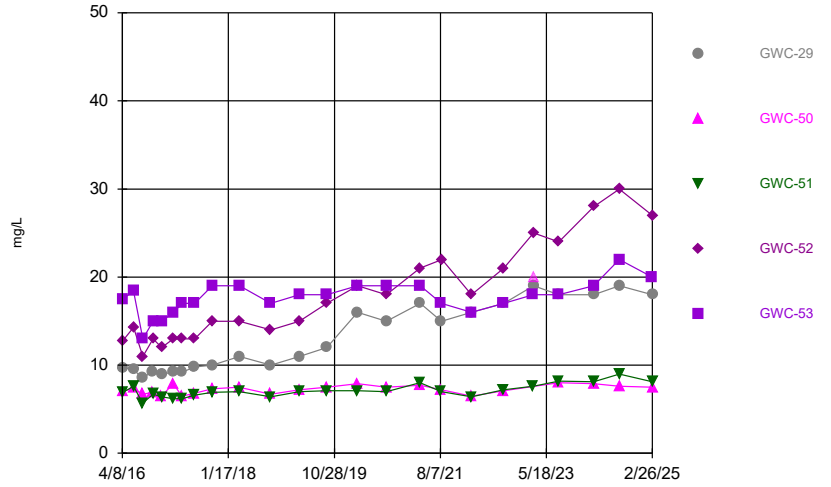


Constituent: Calcium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

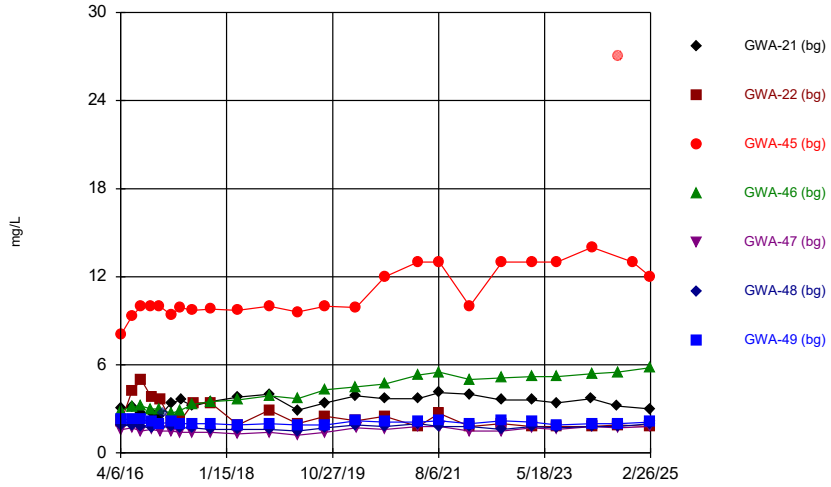


Constituent: Calcium Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series



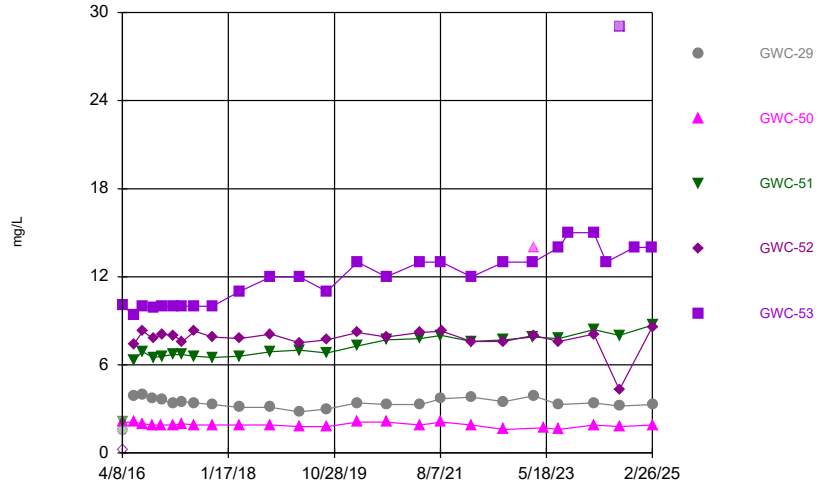
Constituent: Chloride Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Hollow symbols indicate censored values.

Time Series

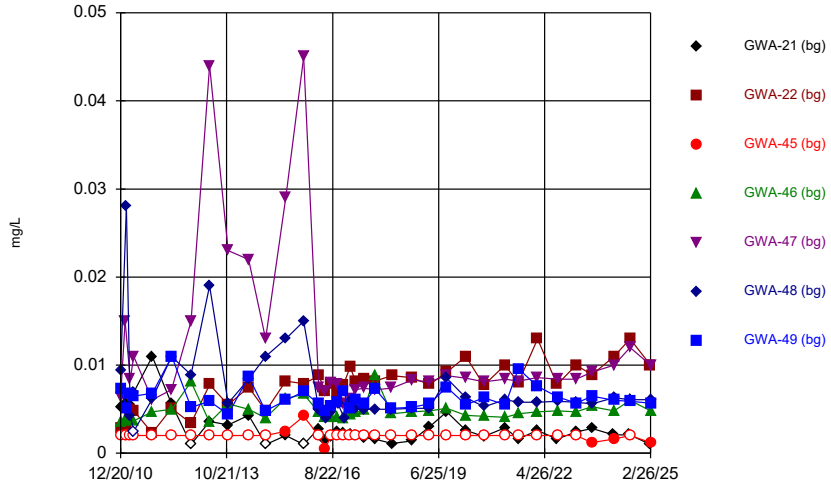


Constituent: Chloride Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

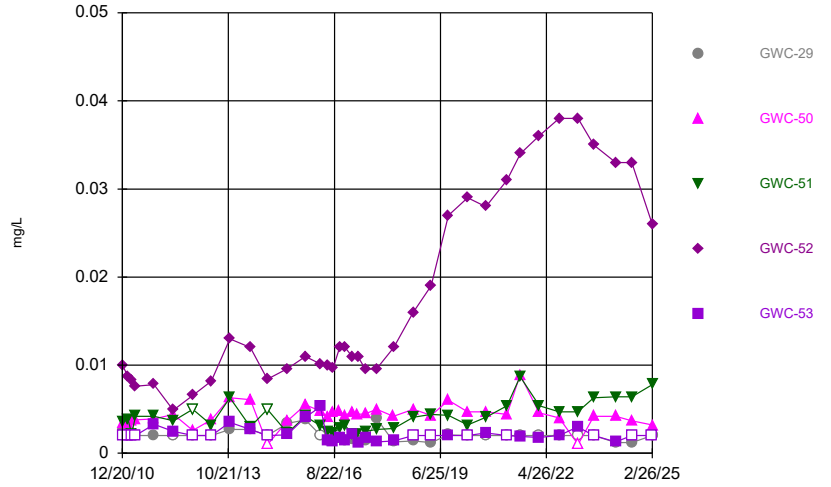
Time Series



Constituent: Chromium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

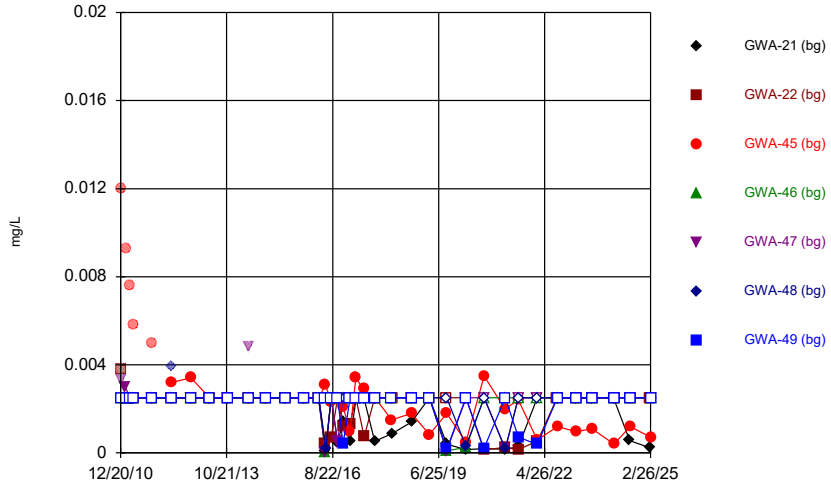
Time Series



Constituent: Chromium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

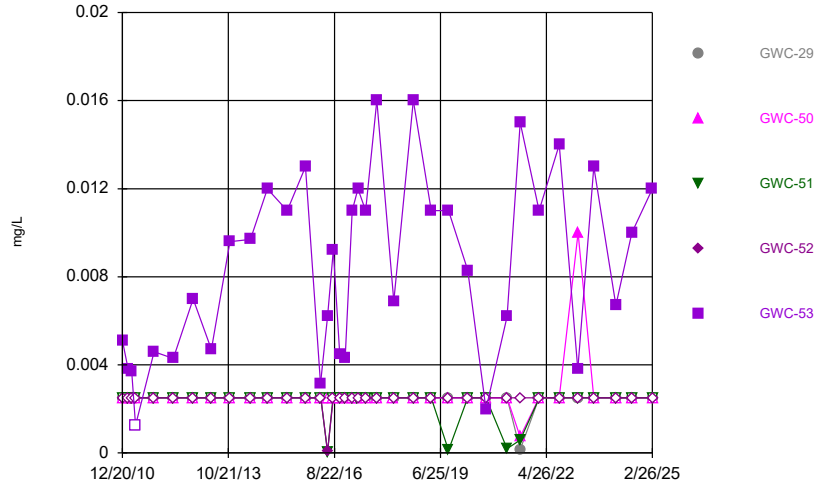
Time Series



Constituent: Cobalt Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

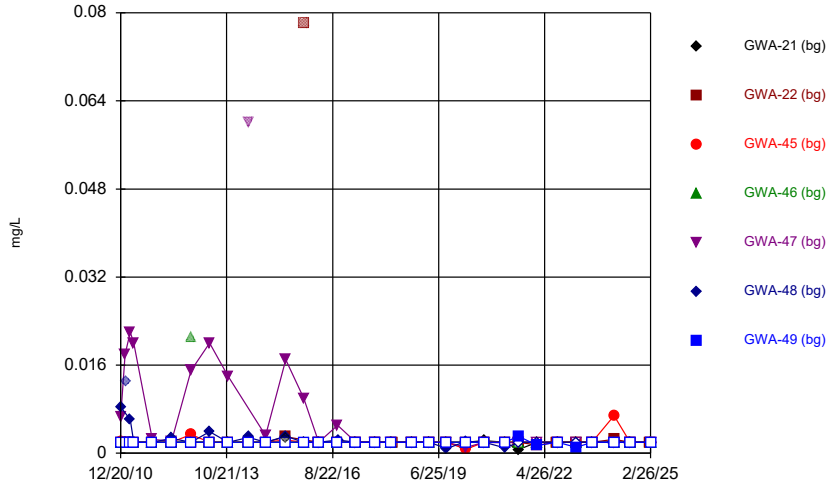
Time Series



Constituent: Cobalt Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

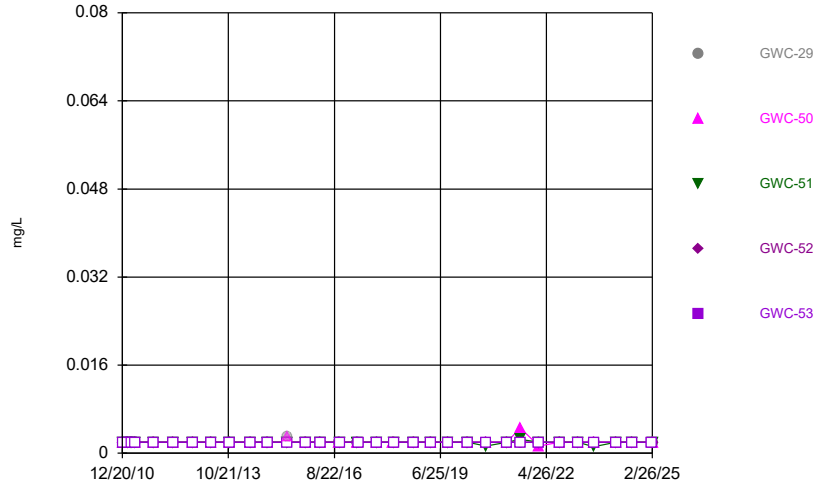
Time Series



Constituent: Copper Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

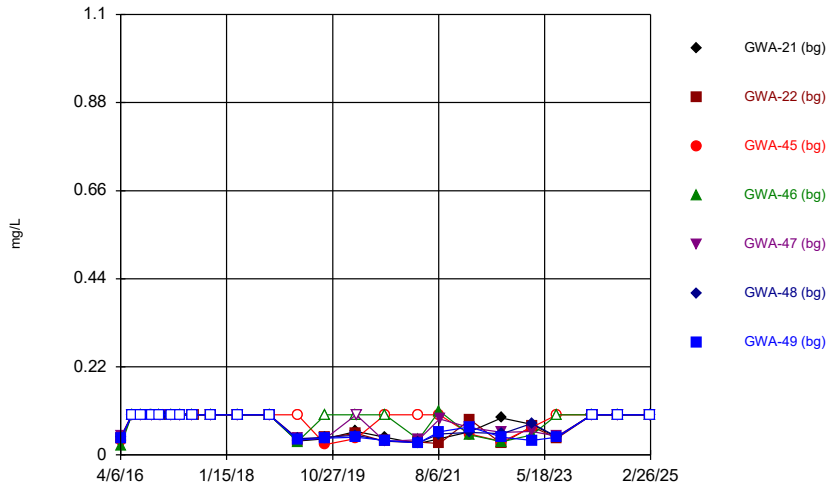
Time Series



Constituent: Copper Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

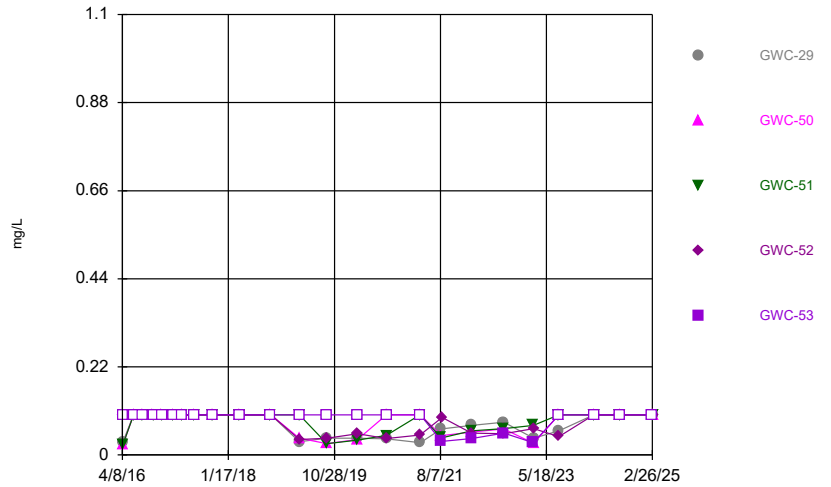
Time Series



Constituent: Fluoride Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

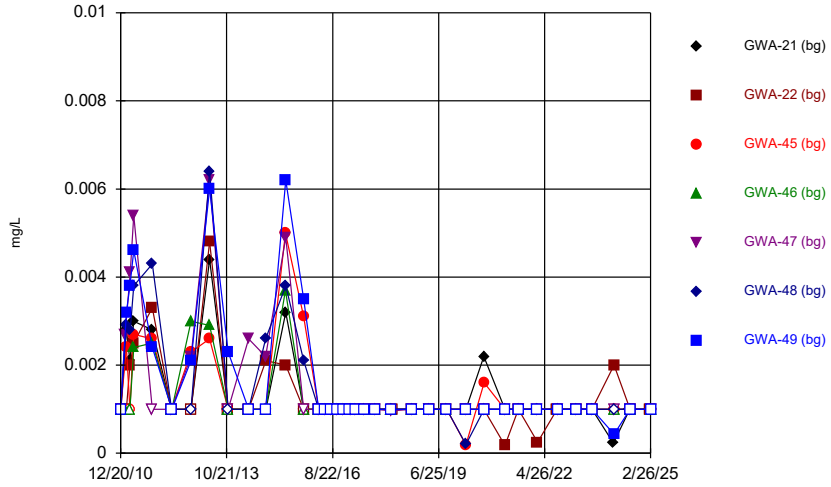
Time Series



Constituent: Fluoride Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

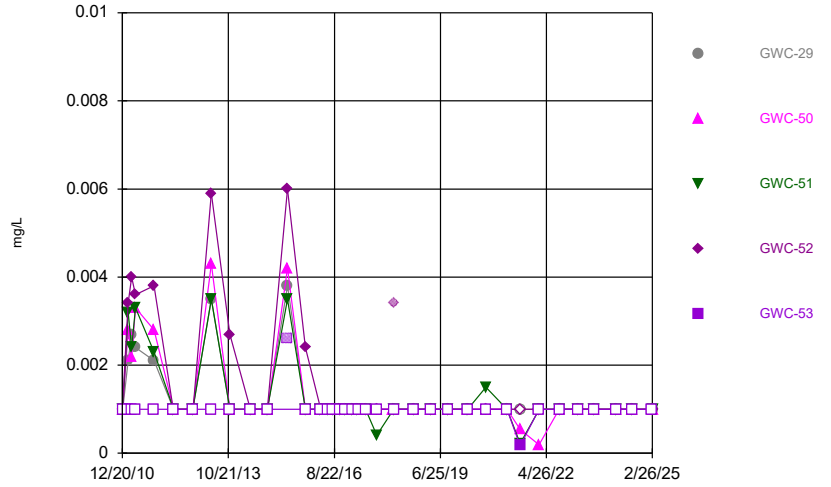
Time Series



Constituent: Lead Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series



Constituent: Lead Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Mercury Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Mercury Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Nickel Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Nickel Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

Constituent: pH, Field Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

Constituent: pH, Field Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Selenium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Silver Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Sulfate Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Sulfate Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: TDS Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG

Time Series

Constituent: TDS Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Thallium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Thallium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Vanadium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Vanadium Analysis Run 6/10/2025 11:21 AM
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Zinc Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.26 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Time Series

Constituent: Zinc Analysis Run 6/10/2025 11:21 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Time Series

Constituent: Antimony (mg/L) Analysis Run 6/10/2025 11:22 AM

Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Within Limit

Prediction Limit

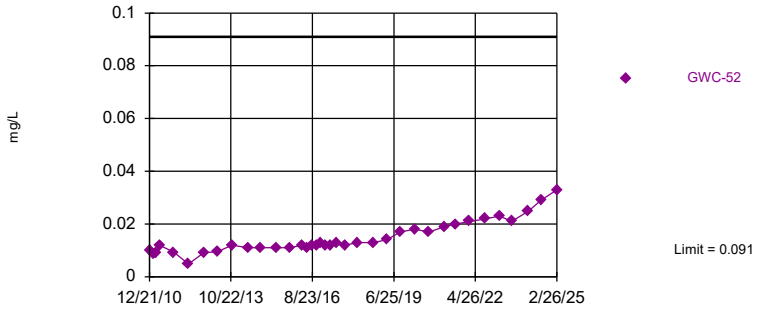
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 250 background values. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Assumes 4 future values.

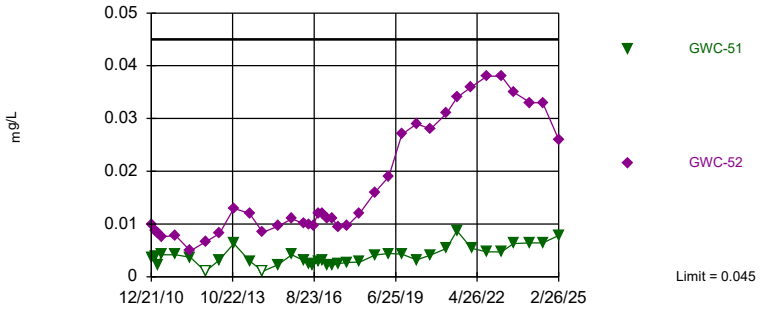
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 259 background values. 13.9% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

Constituent: Chromium Analysis Run 4/24/2025 10:40 AM View: Appendix I - Two Step

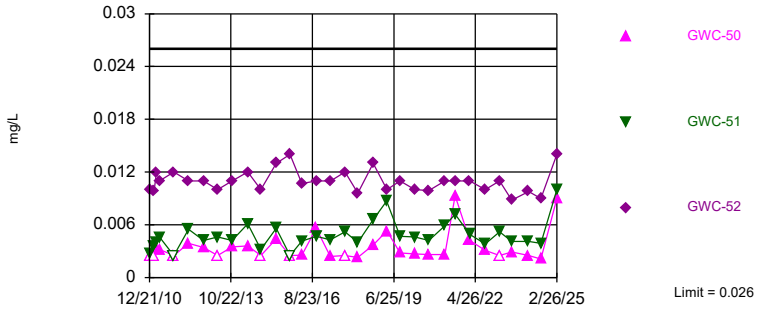
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 222 background values. 17.12% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

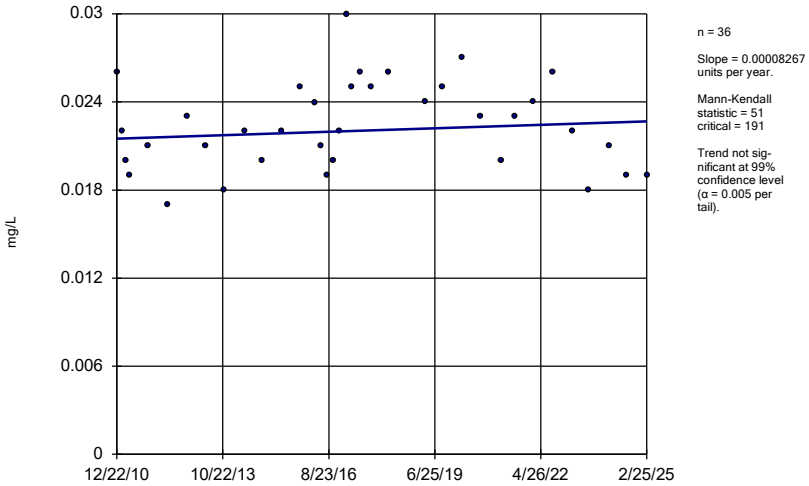
Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Sen's Slope Estimator

GWA-21 (bg)



n = 36

Slope = 0.00008267 units per year.

Mann-Kendall statistic = 51
critical = 191

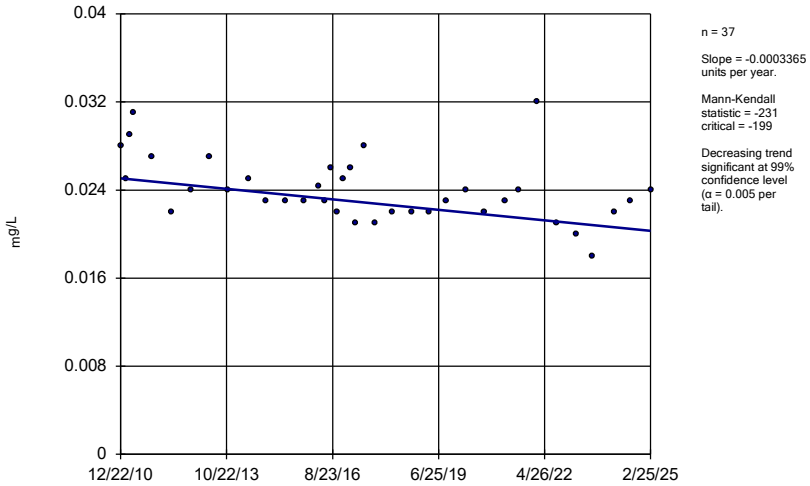
Trend not significant at 99% confidence level (α = 0.005 per tail).

Constituent: Barium Analysis Run 4/24/2025 10:41 AM View: Appendix I - Trend Tests
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Sen's Slope Estimator

GWA-22 (bg)



n = 37

Slope = -0.0003365 units per year.

Mann-Kendall statistic = -231
critical = -199

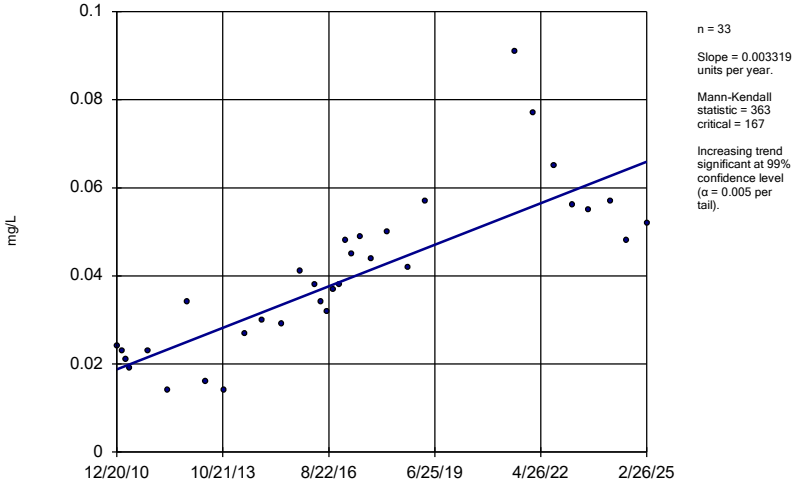
Decreasing trend significant at 99% confidence level (α = 0.005 per tail).

Constituent: Barium Analysis Run 4/24/2025 10:41 AM View: Appendix I - Trend Tests
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Sen's Slope Estimator

GWA-45 (bg)



n = 33

Slope = 0.003319 units per year.

Mann-Kendall statistic = 363
critical = 167

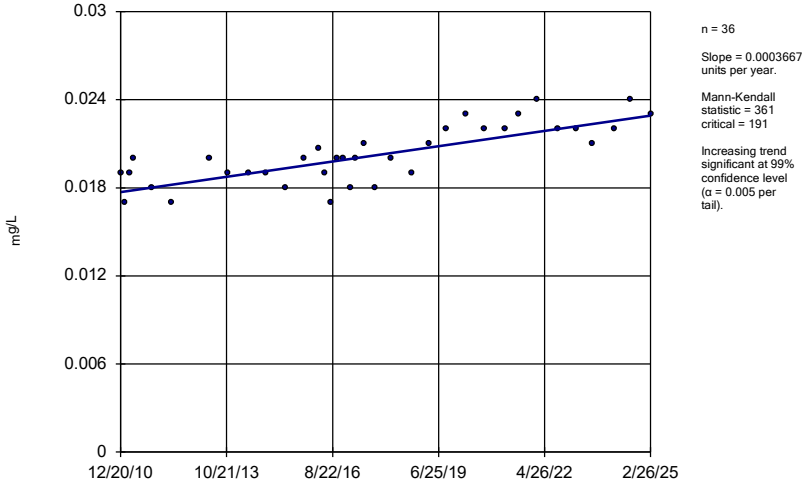
Increasing trend significant at 99% confidence level (α = 0.005 per tail).

Constituent: Barium Analysis Run 4/24/2025 10:41 AM View: Appendix I - Trend Tests
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Sen's Slope Estimator

GWA-46 (bg)



n = 36

Slope = 0.0003667 units per year.

Mann-Kendall statistic = 361
critical = 191

Increasing trend significant at 99% confidence level (α = 0.005 per tail).

Constituent: Barium Analysis Run 4/24/2025 10:41 AM View: Appendix I - Trend Tests
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Within Limit

Prediction Limit

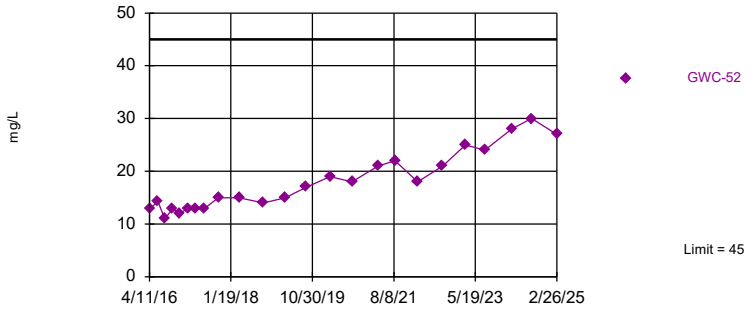
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 168 background values. Annual per-constituent alpha = 0.0007017. Individual comparison alpha = 0.00007019 (1 of 2). Assumes 4 future values.

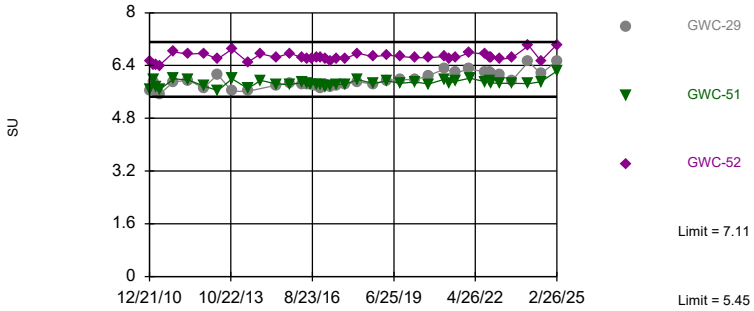
Within Limits

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 278 background values. Annual per-constituent alpha = 0.0009838. Individual comparison alpha = 0.0000984 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

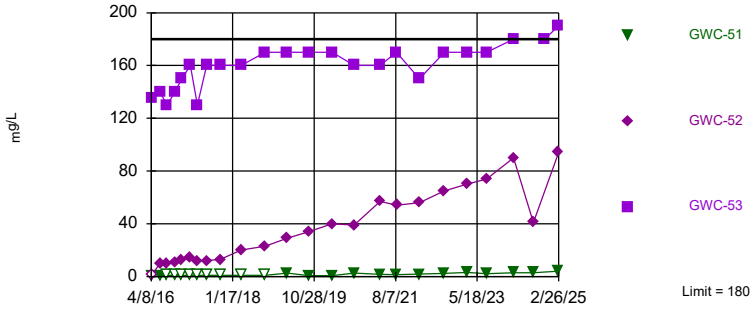
Hollow symbols indicate censored values.

Exceeds Limit: GWC-53

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 168 background values. 36.9% NDs. Annual per-constituent alpha = 0.0007017. Individual comparison alpha = 0.00007019 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

Statistical Analyses July-October 2025

GROUNDWATER STATS CONSULTING

January 30, 2026

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer Cell 1 Landfill
Statistical Analysis – July/August 2025

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the groundwater statistical analysis for the 2025 2nd Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer Cell 1 Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, EPD groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-15, GWA-16, and GWA-17
- **Downgradient wells:** GWC-1, GWC-2, GWC-3, GWC-4, GWC-5, GWC-6, GWC-7, GWC-8A, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-18, GWC-19, and GWC-20

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Kristina Rayner, Founder and Senior Statistician for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The State and CCR program consist of the constituents listed below. The terms "parameters" and "constituents" are used interchangeably:

- **CCR Appendix III -** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I -** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Statistical analyses are not required when 100% non-detects are present in wells for a given constituent. A list of Appendix I well/constituent pairs containing 100% non-detects follows this letter. Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given constituent; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the case of fluoride, varying reporting limits were present in the historic record; however, the most recent reporting limit of 0.2 mg/L was substituted across all wells.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided with the background update described below to

demonstrate that the selected statistical methods for the constituents listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. It is assumed a minimum of 14 background samples for the state parameters and a minimum of 11 background samples for the federal parameters are available to provide adequate statistical power using a 1-of-2 resample plan. For any well/constituent pairs containing less than the minimum sample size requirements, the earlier portion of the record required truncation due to elevated concentrations compared to recently reported measurements which results in more conservative (i.e., lower) limits. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Interwell Prediction Limits with 1-of-2 resample plan (arsenic and silver)
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 16
- # Downgradient wells: 17

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 17

The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The following approaches are used for handling non-detects (USEPA, 2009):

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after screening for any new outliers. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points is available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts to groundwater quality in downgradient wells. Intrawell methods use background data from individual wells and may be overly sensitive to variation. In particular, for nonparametric limits with small background sample sizes, the probability of a false positive result is higher than the desired annual sitewide rate of 10%. Therefore, exceedances may occur as a result of spatial variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine

"background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United States Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed SSI.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an apparent intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for CCR Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance

(ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical data within the same well, are appropriate when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening – Georgia EPD Appendix I – Conducted in August 2019

Outlier Analysis

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters were formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trend Tests

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections for the following constituents:

arsenic, barium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing trends. However, the majority of these trends were relatively low in magnitude when compared to average concentrations; therefore, most records required no adjustments. The following well/constituent pairs did require adjustments to the records in order to remove increasing trends and use more recent data that resulted in statistical limits representative of current groundwater quality conditions: chromium in wells GWC-1 and GWC-10, and vanadium in well GWC-1. A summary of the background periods used for these well/constituent pairs was provided with the background update report. When an increasing trend in a downgradient well is removed by truncating the earlier portion of the record for a constituent analyzed by intrawell limits, it is assumed that the trend is not the result of the facility. This assumption is supported by a boxplot for all wells, by pre-waste data, or by an alternate source demonstration.

Selenium at well GWC-5 had elevated concentrations beginning in 2015, reportedly, due to surface infiltration from a leaking pipe that has since been fixed. Therefore, trend tests were recommended in lieu of prediction limits. While the trend test showed an increasing trend when the entire record of data was evaluated, an additional trend test which evaluated only the most recent 8 measurements was included and demonstrated that the more recent measurements resulted in a statistically significant decreasing trend. Prediction limits resumed when at least 8 measurements returned to background levels.

Several statistically significant decreasing trends were noted, but no records required adjustment during the screening. Vanadium at well GWC-8A has several more recent low-level reported concentrations similar to those reported during the earliest years of sampling. If these low-level concentrations continue, once a minimum of 8 new observations is available, the background data will likely be truncated to only use more recent data for construction of statistical limits.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells which included: arsenic, barium, chromium, cobalt, copper, lead, nickel, selenium, silver, vanadium, and zinc. The ANOVA assists in identifying the most appropriate statistical approach. Based on the results of the background screening, intrawell tests were recommended for antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc, while interwell tests were recommended for arsenic and silver. A summary table of the ANOVA results and a discussion of the intrawell method eligibility was included with the screening.

Background Update Summaries – Georgia EPD Appendix I and CCR Appendix III

June 2021 & May 2023

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells. Both Tukey's outlier test and visual screening confirmed previously flagged outliers with the exception of low values for pH at upgradient well GWA-15, downgradient wells GWC-2, GWC-11, GWC-12, and GWC-14. These values were unflagged during the update as the measurements were representative of concentrations throughout the respective records. Elevated historic concentrations compared to present-day conditions, such as the highest respective values for copper in downgradient well GWC-8A, lead in downgradient well GWC-3, pH in well GWC-2, and TDS in downgradient well GWC-11, were flagged in order to maintain conservative (i.e., lower) statistical limits. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents tested using intrawell prediction limits, which includes all Georgia EPD Appendix I constituents (except arsenic and silver which utilize interwell prediction limits) and all CCR Appendix III constituents, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through to the new compliance samples at each well. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was submitted with the background update. When the medians of the two

groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with each background update report.

Trend Tests

For constituents requiring interwell prediction limits (arsenic and silver), the Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells. No significant trends were identified among upgradient wells for arsenic and silver; therefore, no further action was necessary. Complete graphical results of the trend tests were submitted with the background update report.

April 2025

Outlier Analysis

Prior to updating background data, visual screening and Tukey's outlier test were used to evaluate data for suspected outliers in upgradient and downgradient wells through August/November 2024. Both Tukey's outlier test and visual screening confirmed previously flagged outliers with the exception of values for nickel at downgradient well GWC-8A. These values were unflagged during the update as the measurements were representative of concentrations throughout the record. Elevated historic observations compared to remaining concentrations, such as values for barium in downgradient well GWC-3, calcium in downgradient well GWC-5, chromium in downgradient wells GWC-8A and GWC-10, nickel in downgradient wells GWC-7, GWC-9, GWC-10, and GWC-14, and TDS in downgradient well GWC-8A were flagged in order to maintain conservative (i.e., lower) statistical limits. A summary of all flagged outliers follows this letter (Figure C). Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents tested using intrawell prediction limits, which include all Georgia EPD Appendix I constituents (except arsenic and silver which utilize interwell prediction limits) and all CCR Appendix III constituents, the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through December 2022 to the new compliance samples at each well through August/November 2024. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not

performed. When the medians of the two groups are not statistically significantly different at the 99% confidence level (either an increase or decrease), background data sets may be updated to include the newer compliance data. The results of the Mann-Whitney test showed statistically significant differences for the following well/constituent pairs:

Increase:

- Barium: GWC-4, GWC-10, GWC-12, GWC-13, GWC-14, GWC-19, and GWC-20
- Calcium: GWA-16, GWA-17 (both upgradient), GWC-4, GWC-7, GWC-8A, GWC-9, GWC-14, GWC-19, and GWC-20
- Chloride: GWC-4, GWC-7, GWC-14, GWC-19, and GWC-20
- Chromium: GWA-16 (upgradient) and GWC-19
- Nickel: GWC-8A
- pH: GWA-17 (upgradient)
- Sulfate: GWC-3, GWC-4, GWC-7, GWC-9, and GWC-10
- TDS: GWC-4

Decrease:

- Boron: GWC-5
- Calcium: GWC-5
- Chloride: GWC-5
- Nickel: GWC-3, GWC-6, GWC-9, and GWC-13
- Selenium: GWC-4 and GWC-5
- Sulfate: GWC-5
- TDS: GWC-5
- Vanadium: GWC-4

For both Appendix I and III well/constituent pairs with a statistically significant increase in median concentrations, the following records were not updated with data through August/November 2024 in order to maintain statistical limits that are conservative from a regulatory perspective or an increasing trend is present among more recent data:

- Barium: GWC-4 and GWC-19
- Calcium: GWC-4, GWC-8A, and GWC-19
- Chloride: GWC-4
- Sulfate: GWC-3, GWC-4, and GWC-9
- TDS: GWC-4

The following records identified with statistically significant increasing trends were updated through August/November 2024 because the newer data were within or close to the range of earlier data and would have little to no impact on resulting statistical limits:

- Barium: GWC-10, GWC-12, GWC-13, GWC-14, and GWC-20
- Calcium: GWA-16, GWA-17 (both upgradient), GWC-7, GWC-9, GWC-14, and GWC-20
- Chloride: GWC-7, GWC-14, GWC-19, and GWC-20
- Chromium: GWA-16 (upgradient) and GWC-19
- Nickel: GWC-8A
- pH: GWA-17 (upgradient)
- Sulfate: GWC-7 and GWC-10

Although an increasing trend is present for chloride at well GWC-7 and sulfate at well GWC-10, the reported concentrations remain low with both well/constituent pairs resulting in intrawell prediction limits approximately 5 mg/L, which are significantly lower than the Maximum Concentration Limits (MCLs) of 250 mg/L for both constituents. These records will be re-evaluated during the next background update.

Regarding Appendix I and III well/constituent pairs with a statistically significant decrease in median concentrations, all records were updated with compliance data through August/November 2024 as all contained compliance data at or below existing observations in background or the respective reporting limits. Earlier portions of the record for calcium, selenium, sulfate, and TDS at well GWC-5 were further truncated to construct statistical limits representative of current conditions and are readily capable of detecting changes in groundwater quality. Although not identified by the Mann-Whitney test, concentrations prior to July 2017 for vanadium at downgradient well GWC-8A were significantly higher and more variable than more recent concentrations; therefore, the early portion of the record was truncated to use more recent and stable observations.

The Mann Whitney test did not identify significant differences in medians for lead; however, it was noted during a previous update that historical data prior to 2016 are variable and appear to represent a sampling or analysis error. Therefore, all historical data prior to 2016 for lead were truncated so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective.

A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter in the Date Range Table. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Trend Tests

For constituents requiring interwell prediction limits (arsenic and silver), the Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells at the 99% confidence level. As mentioned above, in the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend, thus reducing variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. No significant trends were identified among upgradient wells for arsenic and silver; therefore, no further action was necessary. Complete graphical results were included with the update.

Prediction Limits - Appendix I & III Constituents – July/August 2025

Intrawell limits were used to evaluate all Appendix I and III constituents with the exception of arsenic and silver, which use interwell limits. In cases where intrawell analyses are recommended and downgradient average concentrations are higher than upgradient observed concentrations for a given constituent, the current assumption is that the higher upgradient concentrations are due to spatial variation rather than a result of practices at the landfill. The pre-waste data support this logic, as well as the alternate source demonstrations prepared by WSP.

When there is not an obvious explanation for observed concentration differences in downgradient wells relative to reported concentrations in upgradient wells (such as arsenic and silver), interwell prediction limits are initially selected for the statistical method until further evidence shows that concentrations are due to spatial variation rather than a result of the facility.

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August/November 2024, except for cases mentioned above, within each well with detections for Appendix I constituents (antimony, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc) and Appendix III constituents (boron, calcium, chloride, fluoride, pH, sulfate, and TDS) to evaluate the July/August 2025 observations (Figures D & E respectively). No statistical analyses were required for well/constituent pairs containing 100% non-detects.

Note that intrawell prediction limits changed slightly as a result of the most recent reporting limits for antimony, beryllium, cadmium, chromium, cobalt, fluoride, nickel, vanadium, and zinc.

In the event of a confirmed initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. The following initial exceedances were noted for the intrawell prediction limits:

Appendix I

- Barium: GWA-15 (upgradient), GWC-4, GWC-7, GWC-19, and GWC-20
- Chromium: GWA-16 (upgradient) and GWC-7
- Mercury: GWC-20
- Nickel: GWC-19
- Selenium: GWC-4
- Zinc: GWC-19

Appendix III

- Boron: GWC-19
- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWA-16, GWA-17 (both upgradient), GWC-4, GWC-7, GWC-19, and GWC-20
- pH (lower limit): GWC-19
- Sulfate: GWC-3, GWC-4, GWC-7, and GWC-19
- TDS: GWA-16 (upgradient), GWC-1, GWC-3, GWC-4, GWC-7, GWC-18, GWC-19, and GWC-20

Two-Step Approach

Following the two-step analysis procedure discussed above, interwell prediction limits were then constructed using pooled upgradient well data through July/August 2025 to evaluate the Appendix I and III apparent intrawell prediction limit exceedances (Figures F and G, respectively). The following statistical exceedances were noted for the interwell prediction limits:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7
- Mercury: GWC-20
- Nickel: GWC-19
- Selenium: GWC-4
- Zinc: GWC-19

Appendix III

- Boron: GWC-19
- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWC-4, GWC-7, and GWC-19
- Sulfate: GWC-3, GWC-4, GWC-7, and GWC-19
- TDS: GWC-1, GWC-4, GWC-7, GWC-18, GWC-19, and GWC-20

Interwell Prediction Limits

Interwell prediction limits, combined with a 1-of-2 resample plan, were then constructed using all pooled upgradient well data through July/August 2025 to develop background limits for arsenic and silver (Figure H). No statistical exceedances were noted for the interwell prediction limits.

Summary tables of the intrawell and interwell prediction limits follow this letter along with the complete graphical results. The interwell limits are updated during each analysis after screening for new outliers on the current upgradient well data, while the intrawell prediction limits are updated when a minimum of four new compliance observations is available.

Trend Tests

When prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure I). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site which is an indication of variability in groundwater unrelated to practices at the site.

A summary of the trend tests follows this letter along with complete graphical results of the trend analysis. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWC-4, GWC-7, and GWC-19
- Calcium: GWA-17 (upgradient), GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWA-15 (upgradient), GWC-4, GWC-7, GWC-19, and GWC-20
- Chromium: GWA-16 and GWA-17 (both upgradient)
- pH: GWA-17 (upgradient)
- Sulfate: GWA-15 (upgradient), GWC-3, GWC-4, and GWC-7
- TDS: GWA-17 (upgradient), GWC-4, GWC-18, GWC-19, and GWC-20

Decreasing:

- Barium: GWA-17 (upgradient)
- Nickel: GWA-15 (upgradient)

Resample Reports – October 2025

Resamples were collected in October 2025 based on the results of the two-step approach for the following well/constituent pairs:

- Barium: GWC-4
- Boron: GWC-19
- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWC-4, GWC-7, and GWC-19
- Chromium: GWC-7
- Mercury: GWC-20
- Nickel: GWC-19
- Selenium: GWC-4
- Sulfate: GWC-4, GWC-7, and GWC-19
- TDS: GWC-1, GWC-4, GWC-7, GWC-18, GWC-19, and GWC-20
- Zinc: GWC-19

Additional resamples were collected for pH at wells GWC-1, GWC-4, GWC-7, GWC-18, GWC-19, and GWC-20.

Intrawell prediction limits were constructed using background data through August/November 2024 to compare the October 2025 resamples for Appendix I and III parameters (Figures J and K). Exceedances were identified for the following well/constituent pairs:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7
- Selenium: GWC-4

Appendix III

- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWC-4 and GWC-7
- Sulfate: GWC-4 and GWC-7
- TDS: GWC-4 and GWC-7

In accordance with the two-step approach, interwell prediction limits were constructed to evaluate the apparent exceedances (Figures L and M). Exceedances were identified for the following well/constituent pairs:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7
- Selenium: GWC-4

Appendix III:

- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWC-4 and GWC-7
- Sulfate: GWC-4 and GWC-7
- TDS: GWC-4 and GWC-7

Summary

Based on the results of the July/August 2025 observations and October 2025 resamples using intrawell prediction limits, interwell prediction limits, and the two-step interwell prediction limit approach, apparent intrawell prediction limit exceedances also exceeded the two-step interwell prediction limits for the following well/constituent pairs:

Appendix I

- Barium: GWC-4
- Chromium: GWC-7
- Selenium: GWC-4

Appendix III

- Calcium: GWC-4, GWC-7, GWC-19, and GWC-20
- Chloride: GWC-4 and GWC-7
- Sulfate: GWC-3, GWC-4, and GWC-7
- TDS: GWC-4 and GWC-7

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer Cell 1 Landfill. If you have any questions or comments, please feel free to contact us.
