Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 32 background values. 93.75% NDs. Well-constituent pair annual alpha = 0.003603. Individual comparison alpha = 0.001803 (1 of 2).

Constituent: Zinc Analysis Run 9/15/2025 11:00 AM View: Appendix I - Intrawell
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27g Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.
Exceeds Limit

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 31 background values. 96.77% NDs. Well-constituent pair annual alpha = 0.003807. Individual comparison alpha = 0.001905 (1 of 2).

Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 23 background values. 91.3% NDs. Well-constituent pair annual alpha = 0.006819. Individual comparison alpha = 0.003415 (1 of 2).

Constituent: Boron Analysis Run 9/9/2025 2:39 PM View: Appendix III - Intrawell

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

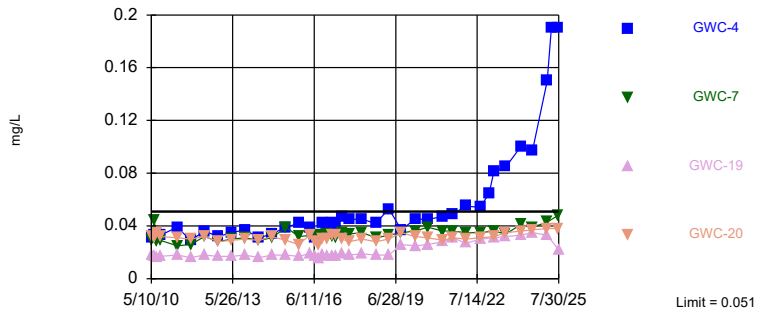
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 117 background values. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

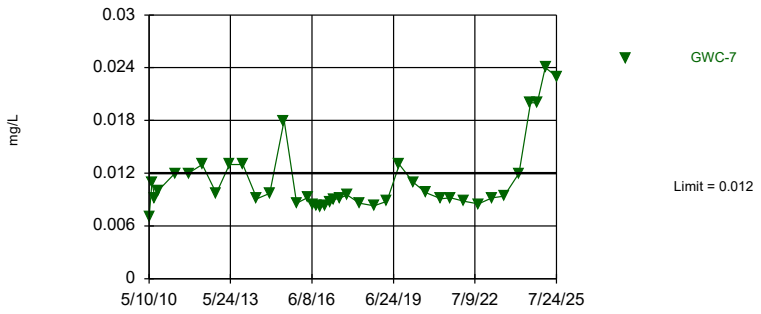
Constituent: Barium Analysis Run 9/9/2025 2:33 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-7

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 117 background values. 30.77% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

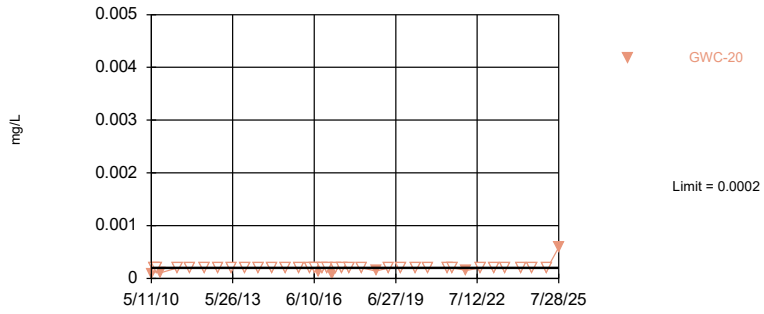
Constituent: Chromium Analysis Run 9/9/2025 2:33 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-20

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 117 background values. 88.03% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

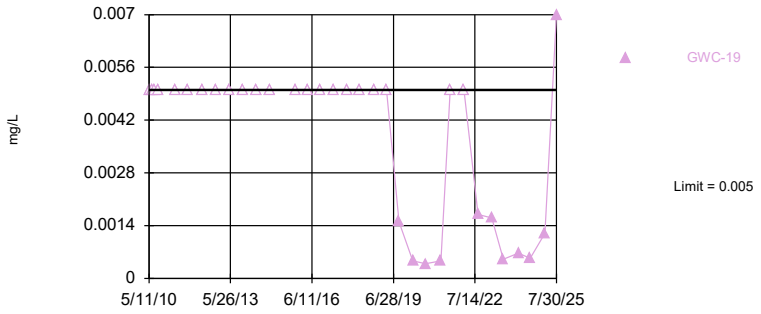
Constituent: Mercury Analysis Run 9/9/2025 2:33 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-19

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 101 background values. 81.19% NDs. Annual per-constituent alpha = 0.006385. Individual comparison alpha = 0.0001884 (1 of 2). Assumes 16 future values.

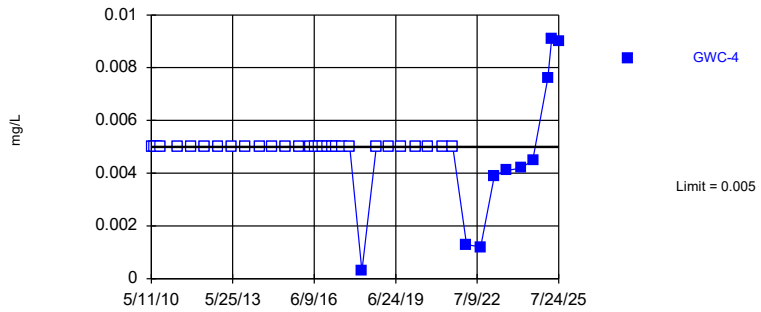
Constituent: Nickel Analysis Run 9/9/2025 2:33 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 117 background values. 94.87% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

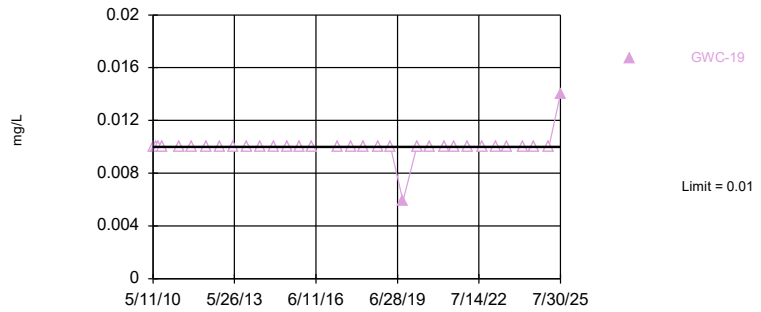
Constituent: Selenium Analysis Run 9/9/2025 2:33 PM View: Appendix I - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-19

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 102 background values. 93.14% NDs. Annual per-constituent alpha = 0.006288. Individual comparison alpha = 0.0001855 (1 of 2). Assumes 16 future values.

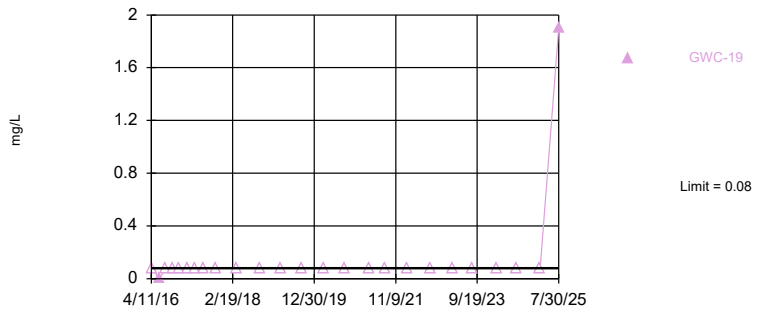
Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-19

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 75 background values. 96% NDs. Annual per-constituent alpha = 0.0114. Individual comparison alpha = 0.000337 (1 of 2). Assumes 16 future values.

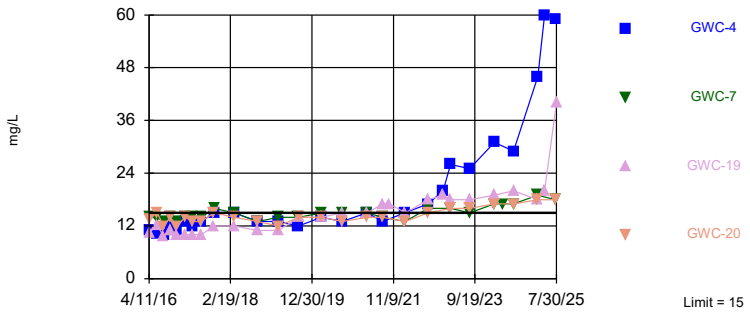
Constituent: Boron Analysis Run 9/9/2025 2:49 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4, GWC-7, GWC-19, GWC-20

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 75 background values. Annual per-constituent alpha = 0.0114. Individual comparison alpha = 0.000337 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

Constituent: Calcium Analysis Run 9/9/2025 2:49 PM View: Appendix III - Interwell Two-Step
Plant Scherer Client: Southern Company Data: Scherer Cell 1

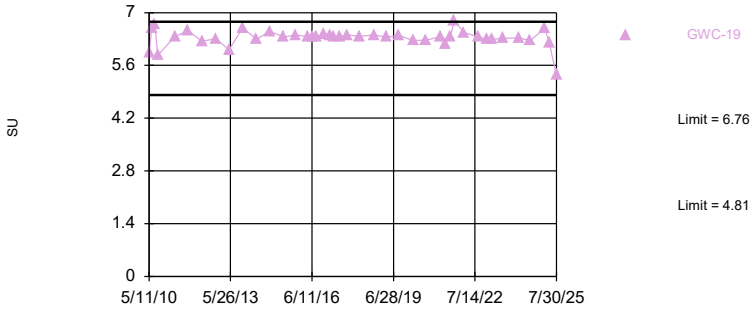
Within Limits

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 118 background values. Annual per-constituent alpha = 0.009482. Individual comparison alpha = 0.0002795 (1 of 2). Assumes 16 future values.

Constituent: pH, Field Analysis Run 9/9/2025 2:49 PM View: Appendix III - Interwell Two-Step

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

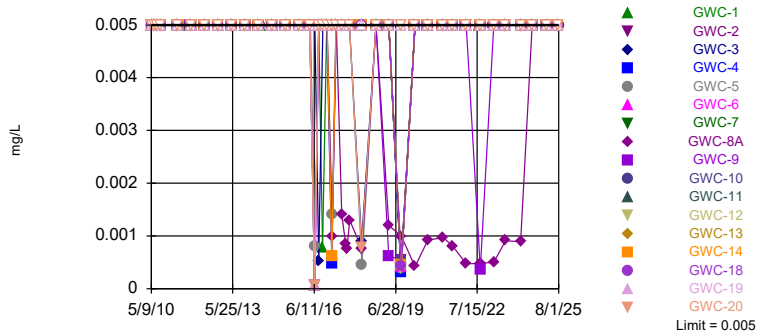
Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 117 background values. 96.58% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Comparing 17 points to limit.

Constituent: Arsenic Analysis Run 9/9/2025 2:37 PM View: Appendix I - Interwell

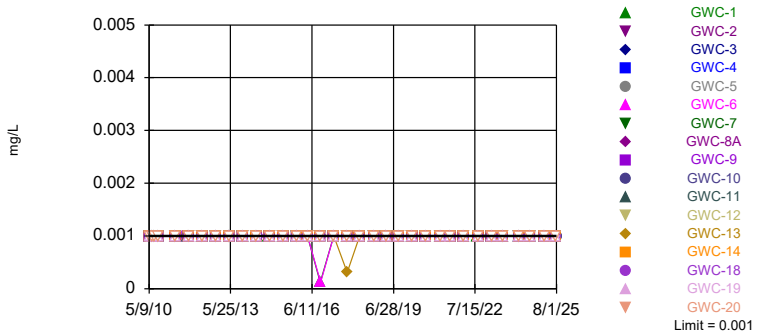
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. All background values (n = 102) were censored; limit is most recent reporting limit. Annual per-constituent alpha = 0.006288. Individual comparison alpha = 0.0001855 (1 of 2). Comparing 17 points to limit.

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit

Prediction Limit

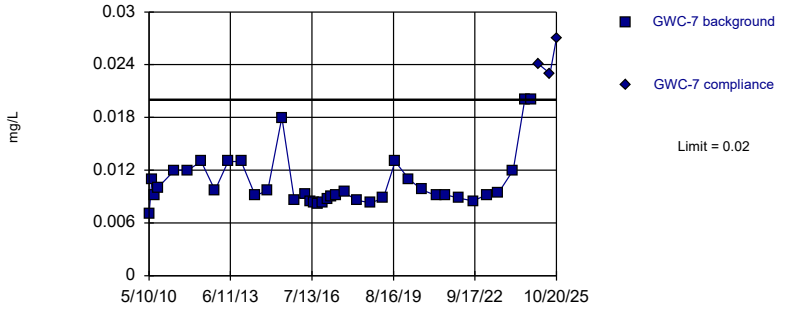
Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 38 background values. Well-constituent pair annual alpha = 0.002586. Individual comparison alpha = 0.001294 (1 of 2).

Constituent: Chromium Analysis Run 12/11/2025 1:46 PM View: Appendix I - Intrawell Resample

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4

Prediction Limit

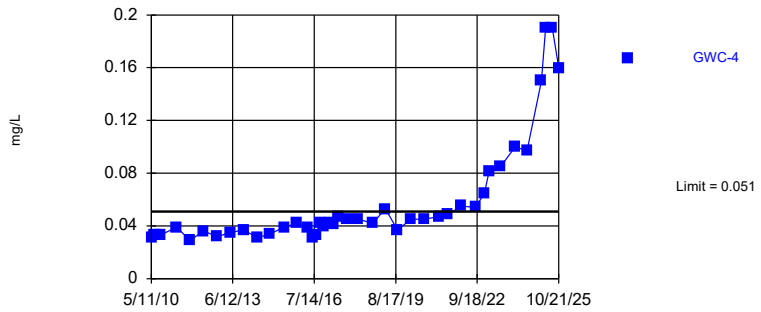
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 117 background values. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

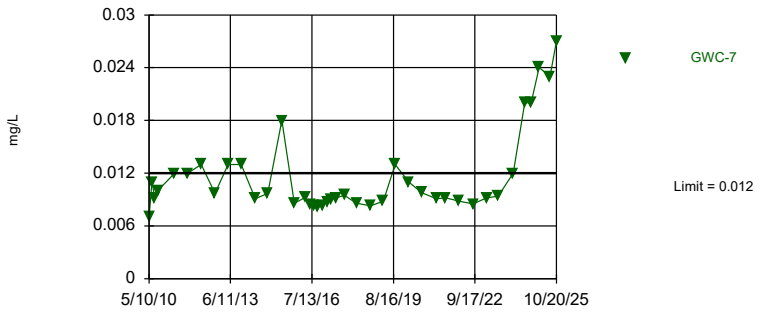
Constituent: Barium Analysis Run 12/11/2025 1:48 PM View: Appendix I Interwell - Two-Step Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-7

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 117 background values. 30.77% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

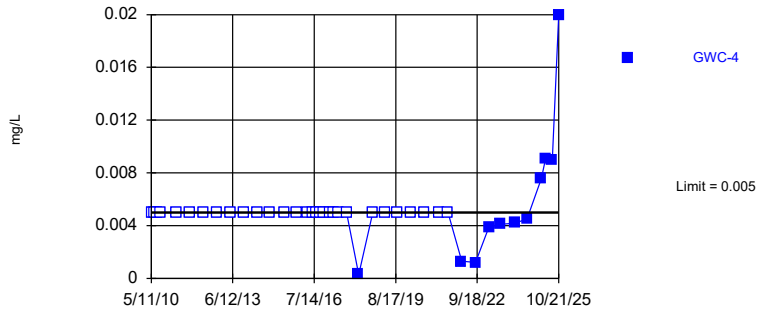
Constituent: Chromium Analysis Run 12/11/2025 1:48 PM View: Appendix I Interwell - Two-Step Resampl
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-4

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 117 background values. 94.87% NDs. Annual per-constituent alpha = 0.004838. Individual comparison alpha = 0.0001426 (1 of 2). Assumes 16 future values.

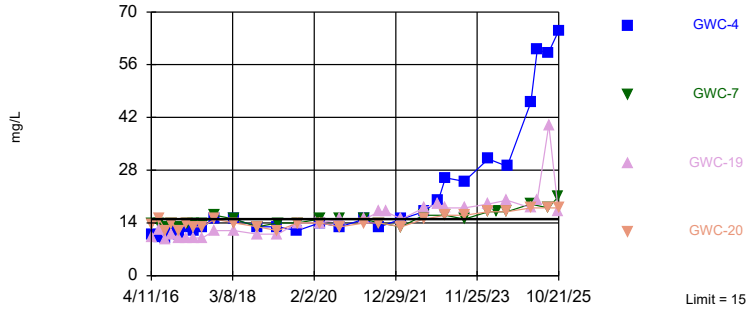
Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4, GWC-7, GWC-19, GWC-20

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 75 background values. Annual per-constituent alpha = 0.0114. Individual comparison alpha = 0.000337 (1 of 2). Comparing 4 points to limit. Assumes 13 future values.

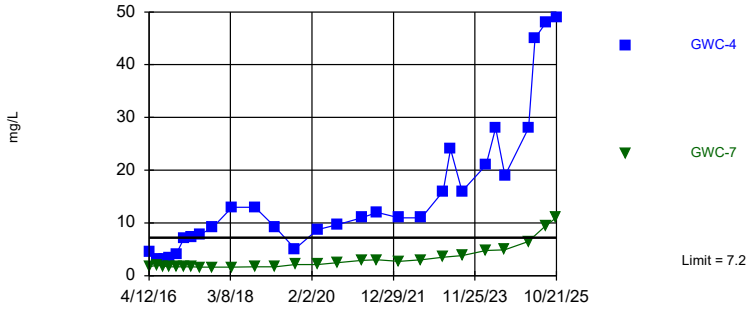
Constituent: Calcium Analysis Run 12/11/2025 1:52 PM View: Appendix III - Interwell Two-Step Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-4, GWC-7

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Francia normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 75 background values. Annual per-constituent alpha = 0.0114. Individual comparison alpha = 0.000337 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

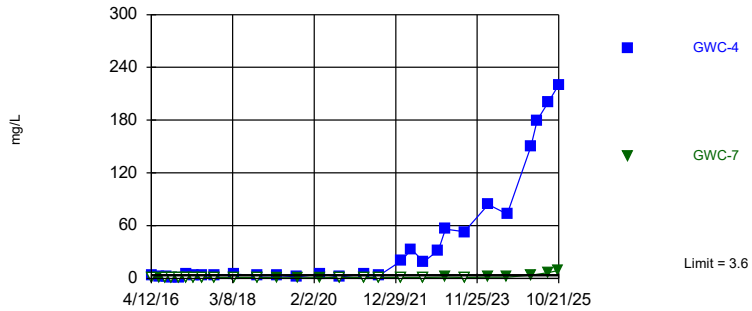
Constituent: Chloride Analysis Run 12/11/2025 1:52 PM View: Appendix III - Interwell Two-Step Resample
Plant Scherer Client: Southern Company Data: Scherer Cell 1

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-4, GWC-7

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 75 background values. 61.33% NDs. Annual per-constituent alpha = 0.0114. Individual comparison alpha = 0.000337 (1 of 2). Comparing 2 points to limit. Assumes 15 future values.

GROUNDWATER STATS CONSULTING

January 30, 2026

Southern Company Services
Attn: Mr. Joju Abraham
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308-3374

Re: Plant Scherer PAC Landfill
Statistical Analysis – July 2025

Dear Mr. Abraham,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the groundwater statistical analysis for the 2025 2nd Semi-Annual Groundwater Monitoring Statistical Analysis sample event for Georgia Power Company's Plant Scherer PAC Landfill. The analysis complies with the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10 and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the Coal Combustion Residuals (CCR) program in 2016. Semi-annual sampling for 16 parameters began in 2010 in accordance with the Georgia Department of Natural Resources, EPD groundwater monitoring regulations. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-21, GWA-22, GWA-45, GWA-46, GWA-47, GWA-48, and GWA-49
- **Downgradient wells:** GWC-29, GWC-50, GWC-51, GWC-52, and GWC-53

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager of Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in

the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III -** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I -** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Due to varying detection limits in data sets, generally due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well. This generally gives the most conservative limit in each case. In the case of cobalt and fluoride, varying reporting limits were present in the historic record; however, the most recent reporting limits of 0.005 mg/L and 0.2 mg/L, respectively were substituted across all wells.

Time series plots for CCR Appendix III and Georgia EPD Appendix I parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs.

In earlier analyses, data at all wells for constituents detected in downgradient wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Power curves were provided during the background update discussed below to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. The EPA suggests that the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, thallium, vanadium, and zinc)
- # Constituents: 15 (silver was 100% non-detects in all downgradient wells)
- # Downgradient wells: 5

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (boron, calcium, chloride, fluoride, pH, sulfate, and TDS)
- # Constituents: 7
- # Downgradient wells: 5

Statistical analyses are not required when 100% non-detects are present in downgradient wells for a given constituent; therefore, no prediction limits were required for silver. A summary of all Appendix I well/constituent pairs with 100% non-detects follows this letter.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% for each semi-annual sample event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits. Non-detects are handled as follows:

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.

- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the intrawell case, data for all wells and constituents may be re-evaluated when a minimum of 4 new data points are available to determine whether earlier concentrations are representative of current groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with a 1-of-2 resample plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods use background data for individual wells and may be overly sensitive to variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is much higher than the desired annual sitewide rate of 10%. Therefore, exceedances may occur as a result of spatial variation rather than facility impacts.

A second step can be used to further evaluate those exceedances and reduce the overall number of statistically significant increases (SSIs) that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial

finding. A statistically significant increase is not declared unless the resample also exceeds the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resamples confirm the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase.

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial variation rather than a result of impact to groundwater quality downgradient of the facility.

Summary of Background Screening – CCR Appendix III – Conducted in 2017

The original background screening for Appendix III constituents was conducted in 2017 by MacStat Consulting. Values identified as outliers were flagged in the database and excluded prior to construction of statistical limits. Intrawell prediction limits, combined with a 1-of-2 resample plan, were recommended. The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells, which assists in identifying the most appropriate statistical approach.

Interwell tests, which compare downgradient well data to statistical limits constructed from pooled upgradient well data, are appropriate when average concentrations are similar across upgradient wells. Intrawell tests, which compare compliance data from a single well to screened historical background data within the same well, are appropriate

when upgradient wells exhibit spatial variation; when statistical limits constructed from upgradient wells would not be conservative from a regulatory perspective; and when downgradient background water quality is unimpacted compared to upgradient water quality for the same parameter. Based on the results of the original background screening, intrawell tests were recommended for all Appendix III parameters.

Summary of Background Screening Georgia EPD Appendix I - Conducted in August 2019

Outlier and Trend Testing

Time series plots were used to identify suspected outliers, or extreme values that would result in limits that are not representative of the current background data population. Suspected outliers at all wells and parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database with "o" and deselected prior to construction of statistical limits. The results of Tukey's outlier test as well as a discussion of potential outliers and flagged values were included with the background screening report.

Seasonality

No obvious seasonal patterns were observed on the time series plots for any of the detected data; therefore, no deseasonalizing adjustments were made to the data. When seasonal patterns are observed, data may be deseasonalized so that the resulting limits will correctly account for the seasonality as a predictable pattern rather than random variation or a release.

Trends

While trends may be identified by visual inspection, a quantification of the trend and its significance is needed. The Sen's Slope/Mann Kendall trend test, which tests for statistically significant increasing or decreasing trends, was used to evaluate data at all upgradient wells and downgradient wells with detections.

In the absence of suspected contamination, significant trending data are typically not included as part of the background data used for construction of prediction limits. This step serves to eliminate the trend and, thus, reduce variation in background. When statistically significant decreasing trends are present, all available data are evaluated to determine whether earlier concentration levels are significantly different from current reported concentrations and will be deselected as necessary. When any records of data

are truncated for the reasons above, a summary report will be provided to show the date ranges used in construction of the statistical limits.

The results of the trend analyses showed several statistically significant increasing and decreasing trends; however, the majority of these were relatively low in magnitude when compared to average concentrations and, therefore, required no adjustments. It was noted that several of the upgradient wells had higher reported measurements in the earliest part of the records for some of the metals. These values were not deselected at this time since the measurements serve as reference data upgradient of the facility. If similar measurements are observed at a later time in one or more downgradient wells, the earlier upgradient data may indicate that the change is occurring rather than a result of practices at the facility. While there was an overall increasing trend in concentrations for cobalt at well GWC-53, data are highly variable and similar to concentrations that have historically been reported in upgradient well GWA-45. Therefore, no adjustment was made to this record at that time.

Determination of Spatial Variation

The Analysis of Variance (ANOVA) was used to statistically evaluate differences in average concentrations among upgradient wells for constituents detected in downgradient wells. The ANOVA assists in identifying the most appropriate statistical approach.

Generally, constituents without significant differences, based on ANOVA across upgradient wells, may be considered for interwell analysis. However, the Scherer PAC Landfill is lined, and pre-waste data are available that show metals were present in low level detections during the collection of background data. Furthermore, for some constituents, the reported concentrations are higher in upgradient wells than in downgradient wells. This would result in interwell limits that would not readily detect changes in the downgradient wells with lower concentrations. Therefore, intrawell prediction limits are recommended as the most appropriate statistical analysis for all of the Georgia EPD constituents at this landfill.

Summary of Background Updates – Georgia EPD Appendix I and CCR Appendix III

June 2021 & May 2023

Outlier Analysis

Prior to updating background data, visual screening was used to evaluate data for suspected outliers in upgradient and downgradient wells through September 2020. All of

the more recent compliance measurements appeared stable compared to the previously screened historical data sets; therefore, no new outliers were flagged except for a high value for lead (0.0034 mg/L) in well GWC-52 in order to maintain conservative (i.e., lower) statistical limits, along with a historic high value for vanadium in upgradient well GWA-47 (0.041 mg/L). Due to an increasing trend for barium at upgradient well GWA-45, observations between September 2019 and April 2021 were also flagged. A summary of all flagged outliers follows this letter. Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents in this instance), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data to the new compliance samples at each well. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not performed. A list of well/constituent pairs with no variation was included in the background update report. When the medians of the two groups are not statistically significantly different at the 99% confidence level, background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test and discussion regarding updating background records were included with the background update report. Note that historical data prior to 2016 for lead were truncated at all wells so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective during the June 2021 background update. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods were re-evaluated during the next background update.

April 2025

Outlier Analysis

Prior to updating background data, visual screening and Tukey's outlier test was used to evaluate data for suspected outliers in upgradient and downgradient wells through August/November 2024. Previously flagged values were confirmed either by Tukey's test or visual screening except for chromium at GWA-45 and vanadium at upgradient wells GWA-21, GWA-22, GWA-45, and GWA-48 since the concentrations were not identified by Tukey's and were similar to remaining values within the respective records. Additionally, as a result of the data received from the EQUIS database, some of the reported measurements at downgradient well GWC-53 for pH and vanadium were different from

those historically used in the Sanitas database; therefore, these values are no longer flagged as outliers. Values identified by Tukey's test and flagged during the update include the highest values for calcium at downgradient well GWC-50, chloride at downgradient wells GWC-50 and GWC-53, cobalt at upgradient well GWA-45, sulfate at downgradient well GWC-53, and TDS at downgradient well GWC-50. Although not identified by Tukey's outlier test, the highest observations in each respective record for boron, sulfate, and zinc at well GWC-50, and chloride and sulfate at well GWA-45 were flagged in order to reduce variation and construct statistical limits that are capable of readily detecting changes in groundwater quality.

Any values identified by Tukey's test but not flagged appeared representative of spatial variation or would not result in substantial changes to resulting statistical limits, and these observations will continue to be monitored. The observations flagged with an "O" flag are included in the Outlier Summary (Figure C). Outliers are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages.

Mann-Whitney Comparison of Medians

For constituents requiring intrawell prediction limits (all Georgia EPD Appendix I and CCR Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2022 to the new compliance samples at each well through August/November 2024. When no variation is present between historical data and compliance samples, the Mann-Whitney test is not used. Previously truncated records were evaluated by comparing the truncated portion of the data set to more recent measurements. Discussions of any truncated records were included in previous background update reports. When the medians of the two groups are not statistically significantly different at the 99% confidence level (either an increase or decrease), background data sets are updated to include the newer compliance data. The results of the Mann-Whitney test showed statistically significant differences for the following well/constituent pairs:

Increase:

- Arsenic: GWA-46 and GWA-47 (both upgradient)
- Barium: GWC-29 and GWC-52
- Calcium GWA-47 (upgradient), GWC-29, GWC-51, and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52
- Nickel: GWC-50
- pH: GWC-29

- Sulfate: GWC-51, GWC-52, and GWC-53
- TDS: GWC-52

Decrease:

- Arsenic: GWA-22 (upgradient) and GWC-52
- Calcium: GWA-45 (upgradient)
- Chloride: GWA-22 (upgradient)
- Chromium: GWA-45 (upgradient)
- Nickel: GWC-29
- Sulfate: GWC-29

For both Appendix I and III well/constituent pairs with a statistically significant increase in median concentrations, the records below were not updated with data through August 2024 due to a continuous increase in concentrations among more recent observations. This step results in statistical limits that are capable of readily detecting changes in groundwater quality and the records are as follows:

- Barium: GWC-52
- Calcium: GWC-52
- Chromium: GWC-52
- Sulfate: GWC-52

The remaining records with statistically significant increases were updated through August/November 2024 and are listed below. For upgradient wells, the increasing concentrations are assumed to result from spatial variation and to represent unimpacted background conditions. The increases in downgradient wells appear to be similar to historic concentrations in the same well or resemble concentrations in at least one upgradient well and would have little to no impact on resulting statistical limits:

- Arsenic: GWA-46 and GWA-47 (both upgradient)
- Barium: GWC-29
- Calcium GWA-47 (upgradient), GWC-29, and GWC-51
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52
- Nickel: GWC-50
- pH: GWC-29
- Sulfate: GWC-51 and GWC-53
- TDS: GWC-52

Regarding Appendix I and III well/constituent pairs with a statistically significant decrease in median concentrations, all records were updated with compliance data as observations

were either reported non-detects and trace values (i.e., at or below the reporting limit) or were within the range of historic concentrations.

Note that concentrations early in the record for calcium at well GWC-29 and TDS at well GWC-52 were truncated so that resulting prediction limits are conservative (i.e., lower) from a regulatory perspective. A summary of well/constituent pairs using a truncated portion of their record to establish intrawell prediction limits follows this letter. All records for Appendix I and Appendix III constituents using intrawell methods will be re-evaluated during the next background update.

Statistical Analysis of Georgia EPD Appendix I Constituents – July 2025

Intrawell limits were constructed for all Georgia EPD Appendix I constituents. In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent, the current assumption is that the higher downgradient concentrations are due to spatial variation rather than a result of practices at the landfill. The pre-waste data support this logic.

Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August/November 2024 within each well for constituents with detections (Figure D). As mentioned above, the Date Range summary provides the period of record used for well/constituent pairs where records have been truncated, the July 2025 compliance samples were compared to these intrawell background limits. As previously discussed, no statistical analyses were included for silver since all records contain 100% non-detects in downgradient wells, or for other individual well/constituent pairs containing 100% non-detects. Note that intrawell prediction limits changed slightly for antimony, arsenic, beryllium, cadmium, chromium, cobalt, nickel, vanadium, and zinc as a result of the most recent reporting limits. Additionally, the date ranges for barium at well GWC-53 were revised to use background data through August 2024 based on the background update performed in the Spring 2025. The results were submitted at that time. No significant difference in the statistical limit occurred as a result of the aforementioned changes.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When resamples confirm the initial exceedance, an SSI is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If a resample falls within the

statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary table of the background intrawell prediction limits and exceedances follows this letter, along with the complete graphical results. Statistical exceedances were noted for the following well/constituent pairs:

- Barium: GWC-52
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52

Two-Step Analysis

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through July 2025 to evaluate the initial intrawell prediction limit exceedances listed above in downgradient wells (Figure E). No exceedances were identified.

Trend Tests

When initial prediction limit exceedances occur in any of the downgradient wells, data are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level to determine whether concentrations are significantly increasing, decreasing, or stable (Figure F). Upgradient wells are included in the trend analyses to identify whether similar patterns exist upgradient of the site. Trends in upgradient trends are an indication of variability in groundwater unrelated to practices at the site. Both a summary and complete graphical results of the trend tests follow this letter. Statistically significant trends were noted for the following well/constituent pairs:

Increasing:

- Barium: GWA-45, GWA-46 (both upgradient), and GWC-52
- Chromium: GWA-22 (upgradient), GWC-51, and GWC-52

Decreasing:

- Barium: GWA-22 (upgradient)
- Chromium: GWA-21 (upgradient)

Note that the cause of the trends for barium and chromium at well GWC-52 is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations reflect spatial variation, the earlier portion of the record may require deselection so that resulting limits are reflective of current water quality conditions.

Statistical Analysis of Appendix III Parameters – July 2025

Intrawell prediction limits for all Appendix III parameters, combined with a 1-of-2 resample plan, were constructed using all historical data through August/November 2024 (Figure G). The July 2025 compliance data were compared to those limits.

As discussed earlier, the most recent reporting limit is substituted on a well-by-well basis for computing intrawell prediction limits. Therefore, individual wells can have different substitutions for a given parameter depending on what the laboratory has reported for each well.

Prediction Limits

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result; therefore, no exceedance is noted, and no further action is necessary. If no resample is collected, the original result is considered a confirmed exceedance. Note that intrawell prediction limits for fluoride changed slightly as a result of a change in the most recent reporting limit as provided by the laboratory. A summary table of the Appendix III prediction limits follows this letter, along with complete graphical results. The following prediction limit exceedances were noted for Appendix III parameters:

- Calcium: GWC-52
- Chloride: GWA-47 (upgradient), GWC-51, and GWC-53
- Sulfate: GWC-51, GWC-52, and GWC-53
- TDS: GWC-51, GWC-52, and GWC-53

Two-Step Analysis

Following the two-step analysis procedure as mentioned above, interwell prediction limits were then constructed using pooled upgradient well data through August 2024 to evaluate the apparent initial intrawell prediction limit exceedances listed above at downgradient wells (Figure H). An exceedance was identified for the following well/constituent pair:

- Chloride: GWC-53
- Sulfate: GWC-53
- TDS: GWC-53

It was noted that upgradient well GWA-45, which is included in the interwell background and represents groundwater quality upgradient of the site, has higher concentrations than neighboring upgradient wells for several of the Appendix III constituents. Therefore, the interwell comparisons for downgradient wells with reported lower concentration levels need to be interpreted cautiously and are further evaluated through trend analysis as described below.

Trend Tests

Data from downgradient well/constituent pairs found to exceed their respective prediction limit were further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure I). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary and complete the trend test results follow this letter. The following statistically significant trends were identified:

Increasing:

- Calcium: GWA-46, GWA-47 (both upgradient), and GWC-52
- Chloride: GWA-45, GWA-46 (both upgradient), GWC-51, and GWC-53
- Sulfate: GWC-51, GWC-52, and GWC-53
- TDS: GWA-45, GWA-47 (both upgradient), GWC-52, and GWC-53

Decreasing:

- Calcium: GWA-21 and GWA-45 (both upgradient)
- Chloride: GWA-22 (upgradient)

Note that the cause of the trends for calcium and sulfate at well GWC-52 is pending and requires further analysis beyond the scope of this analysis. If research shows these higher concentrations reflect spatial variation, the earlier portion of the record may require deselection so that resulting limits are reflective of current water quality conditions.

Resample Reports – October 2025

Resamples were collected in October 2025 based on the results of the two-step approach for the following well/constituent pairs:

- Chloride: GWC-53
- Sulfate: GWC-53
- TDS GWC-53

An additional resample for pH at downgradient well GWC-53 was also collected. Intrawell prediction limits were constructed using background data through August/November 2024 to compare the October 2025 resamples for chloride, pH, sulfate, and TDS at well GWC-53 (Figure J). An exceedance was identified for the following well/constituent pair:

- Chloride: GWC-53

In accordance with the two-step approach, an interwell prediction limit using upgradient well data through July 2025 was constructed to evaluate the apparent exceedance for chloride at GWC-53 (Figure K). The reported measurement of 16 mg/L in well GWC-53 was found to exceed the interwell prediction limit of 14 mg/L.

Summary

Observations from the July 2025 sample event and October 2025 resamples at Scherer PAC were compared to established intrawell prediction limits for all Appendix I and III constituents. For parameters using intrawell prediction limits, the two-step approach followed by trend testing was used to evaluate apparent exceedances. Based on the results of the two-step approach for the July 2025 observations and October 2025 resamples, exceedances were identified for the following well/constituent pairs:

Appendix I:

- None

Appendix III:

- Chloride: GWC-53

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Scherer PAC Landfill. If you have any questions or comments, please feel free to contact us.

Prediction Limit

Intrawell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 30 background values. 70% NDs. Well-constituent pair annual alpha = 0.004011. Individual comparison alpha = 0.002008 (1 of 2).

Constituent: Zinc Analysis Run 9/15/2025 2:00 PM View: Appendix I

Within Limit

Prediction Limit

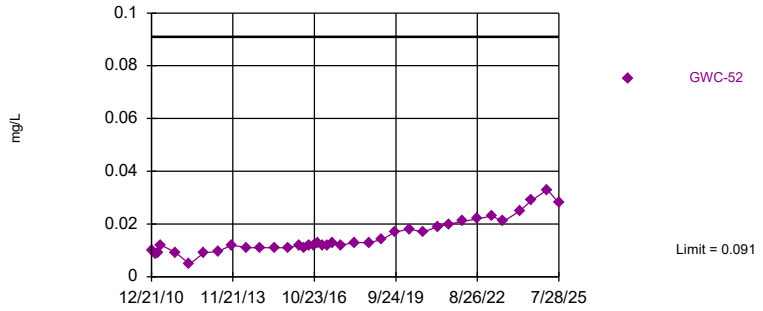
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 257 background values. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Assumes 4 future values.

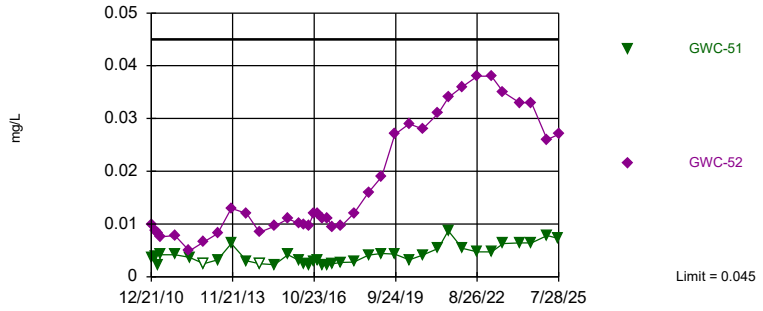
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 266 background values. 14.29% NDs. Annual per-constituent alpha = 0.0004919. Individual comparison alpha = 0.0000492 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

Within Limit

Prediction Limit

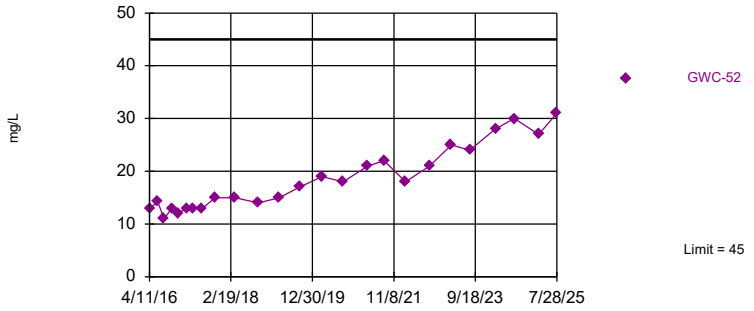
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 175 background values. Annual per-constituent alpha = 0.000646. Individual comparison alpha = 0.00006462 (1 of 2). Assumes 4 future values.

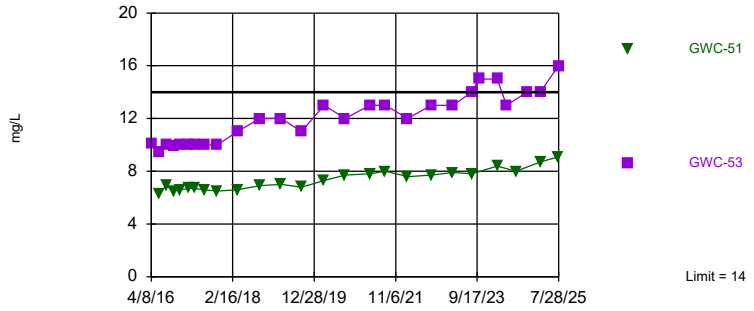
Constituent: Calcium Analysis Run 9/5/2025 12:14 PM View: Appendix III - Two Step
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-53

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 174 background values. Annual per-constituent alpha = 0.0006539. Individual comparison alpha = 0.00006541 (1 of 2). Comparing 2 points to limit. Assumes 3 future values.

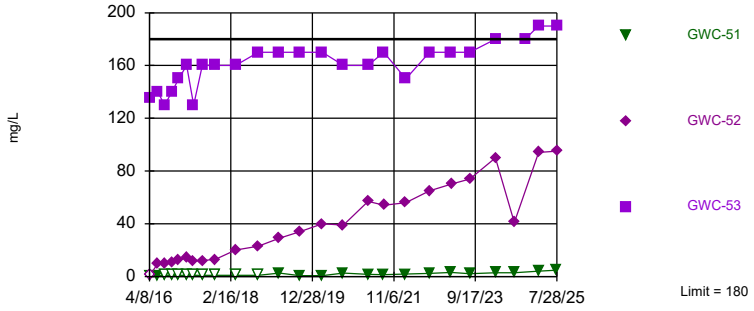
Constituent: Chloride Analysis Run 9/5/2025 12:14 PM View: Appendix III - Two Step
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-53

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 175 background values. 37.14% NDs. Annual per-constituent alpha = 0.000646. Individual comparison alpha = 0.00006462 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

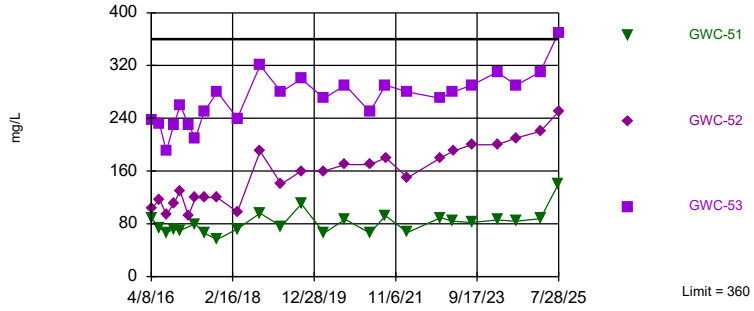
Constituent: Sulfate Analysis Run 9/5/2025 12:14 PM View: Appendix III - Two Step
Plant Scherer Client: Southern Company Data: Scherer PAC

Sanitas™ v.10.0.27 Software licensed to Groundwater Stats Consulting. UG

Exceeds Limit: GWC-53

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 174 background values. 0.5747% NDs. Annual per-constituent alpha = 0.0006539. Individual comparison alpha = 0.00006541 (1 of 2). Comparing 3 points to limit. Assumes 2 future values.

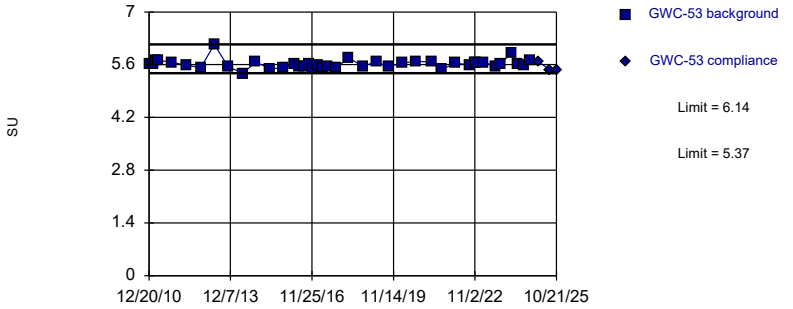
Within Limits

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 41 background values. Well-constituent pair annual alpha = 0.00447. Individual comparison alpha = 0.002236 (1 of 2).

Prediction Limit

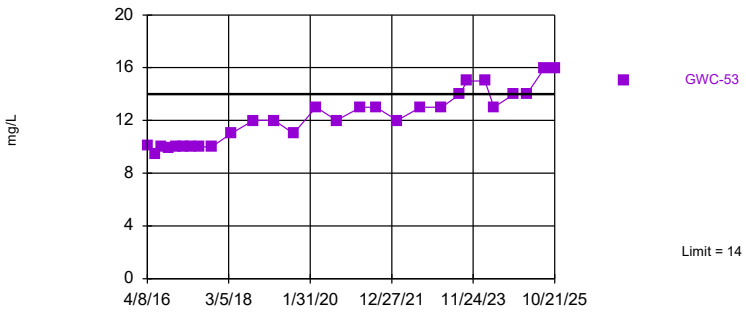
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 174 background values. Annual per-constituent alpha = 0.0006539. Individual comparison alpha = 0.00006541 (1 of 2). Assumes 4 future values.

Certification

This *Alternate Source Demonstration, Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102-009D(CCR), 2024 Second Semi-Annual Monitoring Event,* has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule (40 Code of Federal Regulations [CFR] 257 Subpart D), specifically § 257.90(e), and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with WSP USA Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management 391-3-4-.01.

WSP USA Inc. certifies that monitored constituents were below the applicable Georgia maximum contaminant levels.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by WSP USA, Inc. (WSP) in accordance with 40 CFR § 257.90(e) of the Federal Coal Combustion Residuals (CCR) Rule and 391-3-4-.10 of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of constituents over background concentrations.

These SSIs were reported in the *2024 Annual Groundwater Monitoring and Corrective Action Report* dated January 31, 2025, for the July-August 2024 semi-annual monitoring event and the November 2024 verification resampling (July-August and November 2024) event at Georgia Power's Plant Scherer (Scherer) Cell 1 and Powdered Activated Carbon (PAC) Ash Cell (WSP, 2025). Within 90 days of the reported SSIs, in compliance with 391-3-4-.10, this report describes an alternate source and demonstrates that the SSIs are not the result of a release from Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry.

Semi-annual groundwater quality monitoring and reporting for the landfill units at Plant Scherer are performed in accordance with the Solid Waste Permit 102.009D(CCR); and the Site's *Groundwater Monitoring Plan*, and the CCR Rule 40 CFR § 257.90-98. The following sections address the SSIs noted following the 2024 second semi-annual monitoring event and provide evidence that demonstrates an alternate source for these SSIs.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately five miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area. The Site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (Golder, 2022a). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1).

The Plant Scherer Landfill consists of two active cells, namely, Cell 1 and PAC Ash Cell (Figure 1). The two active cells have been used since 2011 for CCR. The landfill is situated on a topographically high area of the property east/southeast of AP-1. The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. Figure 2 depicts the general configuration of Cell 1 along with the potentiometric surface inferred from groundwater elevations measured in the monitoring well network on July 30, 2024. Figure 3 presents a hydrograph of groundwater elevations for wells around Cell 1.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the *2024 Annual Groundwater Monitoring and Corrective Action Report,* detected concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the July-August and November 2024 sampling events with the exception of barium, calcium, chloride, chromium, sulfate, and total dissolved solids (TDS), in various wells at Cell 1. Three of these SSIs of calcium and sulfate in GWC-9 and chromium in GWC-7 are not subject to prior ASDs and verification sampling conducted in November 2024 confirmed these SSIs. The SSIs noted following the second semi-annual sampling event of 2024 at the Site are below applicable maximum contaminant levels (MCLs) for drinking water

This report documents an Alternate Source Demonstration (ASD) to address the SSIs. Prior ASDs have been prepared to address the confirmed SSIs of barium, calcium, chloride, sulfate, and TDS at GWC-4, calcium at

GWC-7, GWC-19 and GWC-20, and sulfate at GWC-3 and GWC-10, and the basis for these ASDs is reasserted below. Table 1 summarizes the statistical exceedances above PLs following the July-August 2024 sampling event and subsequent November 2024 resampling results, indicates which SSIs are subject to prior ASDs, and indicates which are not—calcium and sulfate in GWC-9 and chromium in GWC-7. The three that were not subject to prior ASDs are all subject to this ASD, meaning that this ASD addresses all SSIs noted during the 2024 second semi-annual monitoring event.

3.1 Statistical Analysis Method

The selected statistical evaluation procedure for Cell 1 and PAC Ash Cell was developed using methodology presented in S*tatistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, (Unified Guidance) (USEPA, March 2009). Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and as recommended in the Unified Guidance.

During detection monitoring at the Site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. Intrawell statistical analyses methods are evaluated for each well and constituent pair. For an apparent SSI, a second step of interwell comparisons is performed. An SSI is declared when downgradient well data exceed both intrawell and interwell PLs.

3.2 Statistical Analysis Results

The calculated prediction limits and the statistical analysis (Sanitas) results are included in *2024 Annual Groundwater Monitoring and Corrective Action Report* (WSP, 2025).

Using the statistical methods described above, including the two-step analyses, the following SSIs are noted following the second semi-annual 2024 monitoring event including both the July-August sampling event and the November 2024 verification sampling event. No SSIs were reported in the PAC Ash Cell wells.

Parameter	Well ID
Cell 1	
Barium	GWC-4*
Calcium	GWC-4*, GWC-7*, GWC-9, GWC-19*, and GWC-20*
Chloride	GWC-4*
Chromium	GWC-7
Sulfate	GWC-3*, GWC-4*, GWC-9, and GWC-10*
TDS	GWC-4*

Note:

*Indicate prior ASDs have been prepared to address confirmed SSIs.

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule § 391-3-4-.10 and 40 CFR § 257.94(e), the following discussion provides a demonstration that the SSIs identified following the second semi-annual 2024 sampling event are not the result of a release from Cell 1 or the PAC Ash Cell. All but three SSIs identified after the July-August and November 2024 sampling have been the subject of prior ASDs, as summarized on Table 1, and the findings of those ASDs have been summarized in this demonstration, particularly in sections 4.1, 4.2 and 4.3.

In general, SSIs can be attributed to natural variability in groundwater chemistry. The variations in metal concentrations at several wells across the Site reflect variations in groundwater flow and chemistry following repairs to the sedimentation ponds and the clear pool made in 2023 and on other occasions in previous years that have affected nearby monitoring wells.

4.1 Barium, Calcium, Chloride, Sulfate, and TDS at GWC-4

4.1.1 Natural Occurrence of Barium in Regional and Site Groundwater

The concentration of barium in groundwater at GWC-4 during the July-August 2024 monitoring event (0.097 mg/L or 97 µg/L) is above the intrawell prediction limit (0.05318 mg/L or 53.18 µg/L), but substantially below the MCL of 2 mg/L (Figure 4). Barium is a naturally occurring alkaline earth metal commonly found in soils at a range of 10 to 5,000 mg/kg in soils across the United States, with an average concentration of 290 mg/kg in the Eastern United States (Smith and Huyck, 1999). Barium is typically found in groundwater as the divalent cation Ba^{2+} across a wide range of redox and pH conditions. As such, barium is prevalent in Piedmont groundwater at concentrations typically higher than other metals (USGS, 2013). Where barium concentrations are high in groundwater, it has been observed that sulfate concentrations in groundwater are relatively low, indicating barite [$BaSO_4$], a common mineral, is a likely control on the barium concentration in natural groundwater (Hem, 1985). With a range of less than 50 parts per billion over the upper PL, such variations in barium and other metal concentrations in groundwater are expected due to natural variations in groundwater quality resulting from variations in groundwater flow.

Barium concentrations at well GWC-4 are comparable to the reported range of barium concentrations (0.02 to 0.12 mg/L) in the crystalline rock aquifers of the Piedmont (USGS, 2009 and USGS, 2013). Barium in site groundwater is most likely derived by barite, which is a naturally occurring mineral. Barite is common in the Piedmont region and has been historically mined in some areas of the Piedmont (Cook, 1978). Because barite is easily dissolved under most geochemical conditions (USGS, 2013), the occurrence of barium at varying concentrations can occur at the Site due to variability of groundwater levels and the subsequent saturation of barium due to increased amounts of barium dissolved into groundwater. A notable decline in groundwater levels, in several site monitoring wells has been observed since 2020 (Figure 3). This decline in groundwater level at the Site coincided with the repair of above-ground pipes and installation of a new liner in the North Sedimentation Pond (Figure 2). Time series concentration trend of barium closely resembles the trends for calcium, sulfate, and TDS, indicating a common mechanism of the release of these constituents to groundwater. This is further described in section 4.1.4.

4.1.2 Natural Variability of Calcium, Sulfate, Chloride, and TDS

The calcium concentration at GWC-4 in July-August 2024 was 29 mg/L, compared to the intrawell PL of 17.6 mg/L (Figure 4). Similar to barium, the calcium concentration in well GWC-4 most likely reflects a decrease in groundwater elevation in GWC-4 due to the repairs and installation of a new liner in the nearby North

Sedimentation Pond. Decreased groundwater levels resulted in increased mineral solubility of calcium and barium. This is reflected in the saturation indices shown by a geochemical model that describes the site conditions based on recently collected ion data. The saturation indices (SI) for barite and gypsum have decreased at GWC-4 since the previous event (spring 2024) from 0.5682 to 0.4228 and from -1.9297 to -2.0125, respectively.

The sulfate concentration at GWC-4 in July-August 2024 was 73 mg/L, compared to the intrawell PL of 6.288 mg/L (Figure 5). The chloride concentration at GWC-4 in July-August 2024 was 19 mg/L, compared to the intrawell PL of 16.42 mg/L (Figure 6). The chloride concentration is relatively low for natural groundwater. The TDS concentration at GWC-4 in July-August 2024 was 250 mg/L, compared to the intrawell PL of 178.1 mg/L (Figure 5). Since TDS is essentially a sum of dissolved major and trace elements in groundwater, TDS is simply a reflection of slightly elevated calcium, sulfate, and chloride concentrations due to natural variations in groundwater quality, and mineral saturation and solubility. Any release of gypsum leachate from the lined CCR landfill units would show notably higher concentrations of TDS and other constituents from CCR. This is not evident in the concentration trends for barium, calcium, chloride, and TDS in well GWC-4.

4.1.3 Lack of Boron in Well GWC-4

Boron is a constituent in CCR materials that is commonly used as an indicator parameter in groundwater monitoring at CCR units because of its behavior as a conservative (non-reactive) element in groundwater quality (Ruhl, 2014). Boron has not been detected historically at GWC-4 (i.e., <0.022 mg/L, Figure 6), with the exception of a single J-flagged (i.e., estimated) detection in November 2024. These results provide an additional line of evidence indicating that the detected SSIs are not the result of a release from the lined CCR landfill units.

4.1.4 Mineral Saturation in Well GWC-4

Mineral saturation indices (SIs)[1] for well GWC-4 are shown in Table 2. The SIs indicate that calcite ($CaCO_3$) and gypsum ($CaSO_4$) are undersaturated and barite ($BaSO_4$) is near equilibrium for the chemical composition of groundwater in well GWC-4. This means additional calcium and sulfate dissolution from the aquifer system remains favorable until chemical equilibrium (calcium, barium, and/or sulfate saturation) is achieved. The apparent increase in TDS concentrations above the PLs is attributable to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater quality in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner provide a site-specific, non-CCR source of soluble minerals. Overall, the groundwater quality in well GWC-4 reflects metal concentrations that are comparable to reported background concentrations in the nearby Piedmont areas (USGS, 2013).

Groundwater elevations in well GWC-4 have declined since 2020 (Figure 3). The changes in groundwater levels affect the pH and redox condition in the uppermost aquifer and subsequently affect the kinetics of mineral

[1] Mineral Saturation Index (SI) is a measure of whether a water will tend to dissolve or precipitate a particular mineral. An SI is negative when the mineral may be dissolved (i.e., it is present below its saturation concentration), positive when it may be precipitated (i.e., is above its saturation concentration), and zero when the water and mineral are at chemical equilibrium. The SI is calculated by comparing the chemical activities of the dissolved ions of the mineral (ion activity product, IAP) with their solubility product (K_{sp}). In equation form, $SI = \log(IAP/K_{sp})$.

dissolution or precipitation. Groundwater elevations at several of the Site wells (including GWC-4) have declined nearly five feet since 2019, likely due to the 2020 construction of the lined sedimentation pond.

Based on these facts, the elevated concentrations of barium, calcium, chloride, sulfate, and TDS at GWC-4 are not the result of a release from Cell 1 but rather due to natural variability in groundwater chemistry due to the change in recharge conditions and cation exchange reactions.

4.2 Calcium at GWC-7, GWC-9, GWC-19, and GWC-20

An ASD for calcium at GWC-7, GWC-19 and GWC-20 was last submitted on November 22, 2024. Calcium concentrations in July-August 2024 at monitoring wells GWC-7, GWC-9, GWC-19 and GWC-20 were 17 mg/L, 22 mg/L, 20 mg/L, and 17 mg/L, respectively. GWC-9 was resampled for calcium in November 2024, confirming the original results. These concentrations are within close range to their corresponding intrawell prediction limits (16 mg/L, 21 mg/L, 15.99 mg/L, and 15.76 mg/L, respectively). As indicated, the concentrations are only slightly elevated in comparison to their PLs. This slight variance from the PLs is indicative of site-wide changes in chemistry likely due to changes in water level or site construction.

General chemistry of wells showing SSIs for calcium are compared to upgradient groundwater monitoring wells on a piper trilinear diagram presented as Figure 7. Review of the piper diagram shows that the constituent concentrations in wells GWC-7, GWC-9, GWC-19 and GWC-20 are similar to upgradient groundwater quality and do not indicate influence from Cell 1 or potentially PAC Ash Cell. Overall, the groundwater quality in wells GWC-7, GWC-9, GWC-19, and GWC-20 reflects metal concentrations that are less than an order of magnitude above their respective intrawell/interwell PLs and are comparable to reported background concentrations in site background wells and in the nearby Piedmont areas (USGS, 2013).

SIs for wells GWC-7, GWC-9, GWC-19, and GWC-20 are shown in Table 2. The SI data indicate that calcite ($CaCO_3$) is undersaturated based on the chemical composition of groundwater in wells GWC-7, GWC-9, GWC-19, and GWC-20. This condition means additional calcium dissolution from the aquifer system remains favourable until chemical equilibrium (calcium saturation) is achieved. The apparent increase in calcium concentrations above the PLs is attributed to mineral dissolution and re-equilibration, and such variations in metal concentrations are expected due to natural variations in groundwater quality in the overburden-fractured rock aquifer at the Site. Physical changes at the Site from engineering and construction activities can also cause these changes when soils rich in calcium and sulfide minerals are exposed to the surface with additional recharge. Additionally, excavation of vegetation and organic soils found in the sediment pond footprint (previously used for stormwater control), the addition of structural fill, and construction of a two-foot layer of compacted clay liner near GWC-19 and GWC-20, coupled with liner repairs and site maintenance at the lined pond near GWC-9 can provide a site-specific, non-CCR source of soluble minerals.

Groundwater elevations in wells GWC-19 and GWC-20 have slightly declined since March 2019 (Figure 3), since the over-excavation and lining of the North Sedimentation Pond. Construction, including the addition of 2,600 feet of underdrain, occurred at the Site. Construction of the drain, which occurred in December 2019, (Brantley, 2020), corresponds to the observed increase is calcium GWC-19 and GWC-20. The decreases in groundwater levels can affect the pH and redox condition in the uppermost aquifer and, subsequently, affect the kinetics of mineral dissolution or precipitation. Groundwater elevations have declined nearly five feet in several of the Site wells (including GWC-19, and GWC-20) since 2019 (Figure 3).

4.3 Sulfate at GWC-3, GWC-9 and GWC-10

SSIs of sulfate have been identified at GWC-3, GWC-9 and GWC-10 following the July-August 2024 sampling event. The November 2024 resampling event confirmed concentrations of sulfate at GWC-3 and GWC-9. Prior ASDs for sulfate were submitted on November 29, 2023, for GWC-3 and on November 22, 2024, for GWC-10.

Calculated mineral SIs for wells GWC-3, GWC-9 and GWC-10 are shown in Table 2. The SI data indicate that gypsum (calcium sulfate) and barite (barium sulfate) are undersaturated, based on the chemical composition of groundwater in wells GWC-3, GWC-9 and GWC-10. This means that calcium, barium, and sulfate are favored for dissolution in the aquifer system until mineral equilibrium (SI = zero) for these constituents is achieved. If there was a release from Cell 1, the expectation would be that groundwater quality would be significantly affected by the major indicator parameters (boron and chloride particularly) and that the groundwater would be saturated with sulfate and barium (i.e., the saturation indices for these constituents would be notably greater than zero).

General chemistry at GWC-3, GWC-9 and GWC-10 compared to upgradient groundwater monitoring wells is presented on a piper trilinear diagram (Figure 7). Review of the piper diagram shows that GWC-3, GWC-9 and GWC-10 concentrations are similar to upgradient groundwater quality and do not suggest influence from another source (i.e., Cell 1).

Concentrations of boron, a primary indicator parameter, have remained low (0.13 mg/L or less) in groundwater from wells GWC-3, GWC-9 and GWC-10 and no trends are noted. Chloride concentrations in these wells have also remained low (5.2 mg/L or less) (Figure 10). If the SSIs of sulfate reported in wells GWC-3, GWC-9 and GWC-10 were due to a release from the landfill, an increase in multiple indicator parameters would be expected, notably boron and chloride, which has not been observed. As a result, the increases in sulfate concentration at GWC-3, GWC-9 and GWC-10 are attributed to natural variations in groundwater chemistry.

4.4 Chromium at GWC-7

The chromium SSI identified at GWC-7 following the July-August 2024 sampling event was confirmed during the November 2024 resampling event. The concentration of chromium following the second semi-annual sampling event and the November 2024 resampling event in groundwater at GWC-7 (0.02 mg/L) is slightly above the intrawell prediction limit (0.018 mg/L), and below the MCL of 0.1 mg/L (Figure 9). Naturally occurring chromium is prevalent in groundwater from aquifer systems composed of ultramafic rocks, known to have elevated chromium concentrations relative to other rock types. Site-specific geologic investigations and mapping have confirmed the presence of these types of ultramafic rocks in the subsurface underlying Plant Scherer (Golder, 2020).

Review of the piper diagram (Figure 7), shows that the general chemistry at GWC-7, is similar to upgradient groundwater quality and does not suggest influence from another source (i.e., Cell 1). Concentrations of boron at GWC-7 have remained below reporting limits (less than 0.08 mg/L) and no trends are noted. Chloride concentrations in GWC-7 also remain low (below 4.9 mg/L) (Figure 10). Per these indications, the SSI of chromium at GWC-7 can attributed to natural variations in groundwater chemistry.

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2024 Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell*, *Permit No. 102-009D(CCR)*, dated January 31, 2025. In accordance with 40 CFR § 257.94(e) and §391-3-4-.10 of

the Georgia Solid Waste Management Rules, this ASD addresses each of the SSIs noted following the July-August 2024 sampling and the November 2024 resampling events.

Based on the data presented herein, SSIs from the July-August and November 2024 monitoring/resampling events are not the result of a release of constituents from the lined landfill units, but rather natural variability in groundwater quality. The lines of evidence include:

- The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. There is no evidence of a release through the liner systems.
- Construction and repair of the lining of the North Sedimentation Pond has affected localized aquifer recharge and groundwater elevations in nearby wells.
- The reported concentrations of barium are within the range of concentrations expected in the overburden – fractured bedrock aquifers in samples from the Piedmont in the southeastern United States (USGS, 2009; USGS, 2013).
- Site-specific geologic investigations and mapping have confirmed the presence of ultramafic rocks in the subsurface underlying Plant Scherer that are known to have elevated chromium concentrations relative to other rock types (Golder, 2020).
- The chemical composition of groundwater in wells GWC-3, GWC-7, GWC-9, GWC-10, GWC-19, and GWC-20, is similar to upgradient groundwater (Figure 7).
- Boron, a primary indicator parameter for CCR, does not exhibit an SSI at wells GWC-3, GWC-4, GWC-7, GWC-9, GWC-10, GWC-19, and GWC-20
- Mineral saturation indices suggest that barium, chloride, sulfate, and hence, overall TDS concentrations in groundwater in GWC-3, GWC-4, GWC-7, GWC-9, GWC-10, GWC-19, and GWC-20 are affected by the natural mineral dissolution in the aquifer materials rather than a release from Cell 1.

The SSIs addressed above are below their MCLs and occur at low concentrations commonly noted in groundwater unaffected by CCR units. Based on the findings presented herein, Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Semi-Annual report.

Note:
Mineral Saturation Index (SI) is a measure of whether a water will tend to dissolve or precipitate a particular mineral. An SI is negative when the mineral may be dissolved (i.e., it is present below its saturation concentration), positive when it may be precipitated (i.e., is above its saturation concentration), and zero when the water and mineral are at chemical equilibrium. The SI is calculated by comparing the chemical activities of the dissolved ions of the mineral (ion activity product, IAP) with their solubility product (K_{sp}). In equation form, $SI = \log(IAP/K_{sp})$

Certification

This *Alternate Source Demonstration, Plant Scherer Cell 1 and PAC Ash Cell Permit No. 102-009D(CCR), 2025 First Semi-Annual Monitoring Event,* has been prepared in compliance with the United States Environmental Protection Agency Coal Combustion Residual Rule (40 Code of Federal Regulations [CFR] 257 Subpart D), specifically § 257.90(e), and the Georgia Environmental Protection Division Rules for Solid Waste Management 391-3-4-.10 by a qualified groundwater scientist or engineer with WSP USA Inc. I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management 391-3-4-.01.

WSP USA Inc. certifies that monitored constituents were below the applicable Georgia maximum contaminant levels.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) has been prepared on behalf of Georgia Power Company (Georgia Power) by WSP USA, Inc. (WSP) in accordance with 40 CFR § 257.90(e) of the Federal Coal Combustion Residuals (CCR) Rule and 391-3-4-.10 of the Georgia (GA) Solid Waste Management Rules to address the statistically significant increases (SSIs) of constituents over background concentrations.

These SSIs were reported in the *2025 Semi-Annual Groundwater Monitoring and Corrective Action Report* dated August 29, 2025, for the 2025 first semi-annual monitoring event at Georgia Power's Plant Scherer (Scherer) Cell1 and Powdered Activated Carbon (PAC) Ash Cell (WSP 2025a). Within 90 days of the reported SSIs, in compliance with 391-3-4-.10, this report describes an alternate source and demonstrates that the SSIs are not the result of a release from within the waste boundary of Cell 1 or PAC Ash Cell, but rather due to natural variability in groundwater chemistry or the result of water management operations outside the landfill waste boundary.

2.0 SITE DESCRIPTION

Plant Scherer is a coal-fired power generation facility located in northeast Monroe County approximately five miles south of Juliette, GA. The property occupies approximately 13,000 acres and is bounded on the south by Lake Juliette. The plant is primarily surrounded by agricultural and residential use. Figure 1 depicts the location of Plant Scherer relative to the surrounding area. The Site is located within the Piedmont Physiographic Province of central Georgia, which is characterized by gently rolling hills and narrow valleys, with locally pronounced linear ridges (WSP 2025b). Overall, the property slopes gently south towards Lake Juliette and east toward the Ocmulgee River (Figure 1).

The Plant Scherer Landfill consists of two active cells, namely, Cell 1 and PAC Ash Cell (Figure 1). The two active cells have been used since 2011 for CCR. The landfill is situated on a topographically high area of the property east/southeast of AP-1. The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system. Figure 2 depicts the general configuration of Cell 1 and PAC Ash Cell along with the potentiometric surface inferred from groundwater elevations measured in the monitoring well network on February 18, 2025. Figure 3 presents a hydrograph of groundwater elevations for wells around Cell 1.

3.0 EVALUATION OF ANALYTICAL RESULTS & STATISTICAL ANALYSES

As presented in the *2025 Semi-Annual Groundwater Monitoring and Corrective Action Report,* detected concentrations of target constituents are below the established prediction limits (PLs) in groundwater samples collected during the 2025 first semi-annual event with the exception of barium, calcium, chloride, chromium, selenium, sulfate, and total dissolved solids (TDS), in various wells at Cell 1 and sulfate at GWC-53 at PAC Ash Cell. The selenium SSI at GWC-4 was not subject to prior ASDs and a verification sampling conducted in April 2025 confirmed the SSI. The sulfate SSI at PAC Ash Cell well GWC-53 has also not been subject to a prior ASD. The SSIs noted following the first semi-annual sampling event of 2025 at the Site are below applicable maximum contaminant levels (MCLs) and secondary MCLs for drinking water.

Prior ASDs have been prepared to address the confirmed SSIs of barium, calcium, chloride, sulfate, and TDS at GWC-4, calcium and chromium at GWC-7, calcium at GWC-9, GWC-19 and GWC-20, and sulfate at GWC-3 and GWC-6 and GWC-9, and the basis for these ASDs is reasserted below. Table 1 summarizes the statistical exceedances above PLs following the February and April 2025 sampling events, and specifies which SSIs are

subject to prior ASDs. This ASD addresses each of the SSIs noted following the 2025 first semi-annual monitoring event.

3.1 Statistical Analysis Method

The selected statistical evaluation procedure for Cell 1 and PAC Ash Cell was developed using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, (Unified Guidance) (USEPA March 2009). Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision-support software package that incorporates the statistical tests required of Subtitle C and D facilities by United States Environmental Protection Agency (USEPA) regulations and as recommended in the Unified Guidance.

During detection monitoring at the Site, groundwater quality data are evaluated using a two-step statistical approach (i.e., intrawell followed by interwell PLs). The statistical method(s) use an optional 1-of-2 verification resample plan. Intrawell statistical analyses methods are evaluated for each well and constituent pair. For an apparent SSI, a second step of interwell comparisons is performed. An SSI is declared when downgradient well data exceed both intrawell and interwell PLs.

3.2 Statistical Analysis Results

The calculated prediction limits and the statistical analysis (Sanitas) results are included in *2025 Semi-Annual Groundwater Monitoring and Corrective Action Report* (WSP 2025a).

Using the statistical methods described above, including the two-step analyses, the following SSIs are noted following the first semi-annual 2025 monitoring event including both the February sampling event and the April 2025 verification sampling event.

Parameter	Well ID
Cell 1	
Barium	GWC-4*
Calcium	GWC-4*, GWC-7*, GWC-9*, GWC-19*, and GWC-20*
Chloride	GWC-4*
Chromium	GWC-7*
Selenium	GWC-4
Sulfate	GWC-3*, GWC-4*, GWC-6, and GWC-9*
TDS	GWC-4*
PAC Ash Cell	
Sulfate	GWC-53

Note:
*Indicates prior ASDs have been prepared to address confirmed SSIs.

4.0 ALTERNATE SOURCE DEMONSTRATION

In accordance with Rule § 391-3-4-.10 and 40 CFR § 257.94(e), the following discussion provides a demonstration that the SSIs identified following the first semi-annual 2025 sampling event are not the result of a release from within the waste boundary of Cell 1 or the PAC Ash Cell. All but two SSIs identified following the February and April 2025 sampling have been the subject of prior ASDs, as summarized on Table 1, and the findings of those ASDs have been summarized in this demonstration, particularly in section 4.0.

The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system which continue to function as designed. In general, many of the SSIs can be attributed to apparent natural variability in groundwater chemistry, other SSIs may be attributed to an alternate source other than release from the Cell 1 or the PAC Ash Cell landfill units. The variations in metal concentrations at several wells across the Site reflect variations in groundwater flow. Repairs to the sedimentation ponds and the Clear Pool liner completed in 2023 and on other occasions in previous years have affected the groundwater chemistry in nearby monitoring wells. A leak detection survey performed in August 2025, of the North Sedimentation Pond and Clear Pool, has identified anomalies in the Clear Pool that may represent an alternate potential source. Georgia Power is securing appropriate materials and coordinating additional assessment of and repairs to the liner for the Clear Pool. It is anticipated that these repairs will be completed in first quarter of 2026.

4.1 GWC-4 (Barium, Calcium, Chloride, Selenium, Sulfate, and TDS)

Reported concentrations of barium, calcium, chloride, selenium, sulfate and TDS exceed the applicable statistical limit following the first semi-annual monitoring event in 2025. Based on a recent leak detection survey (refer to Section 4.2 Electric Liner Leak Detection Survey), it appears that landfill water management in the Clear Pool, outside the solid waste boundary, is likely to have caused the elevated concentrations of these constituents.

A notable decline in groundwater levels in several site monitoring wells has also been observed since 2020 (Figure 3), while the groundwater elevations have remained fairly stable in the upgradient wells. The decline in groundwater levels in this area of the Site coincided with the repair of above-ground pipes and liner installation for the North Sedimentation Pond (Figure 2). These activities appear to have reduced local groundwater recharge. Time series concentration trends for barium, calcium, sulfate, and TDS, indicating a common mechanism of the release for the presence of these constituents in groundwater, i.e. the notable decline in water levels. The concentrations of calcium, sulfate, chloride, and TDS in GWC-4 slightly exceed prediction limits (Table 1). Because TDS is essentially a sum of dissolved major and trace elements in groundwater, TDS is simply a reflection of slightly elevated calcium, sulfate, and chloride concentrations in the Site groundwater.

The concentration of selenium following the February 2025 sampling, the April 2025 re-sampling events, and the second semi-annual event in July 2025 events in groundwater at GWC-4 (0.0076 mg/L, 0.0091 mg/L, and 0.0090 mg/L, respectively; Appendix B) are slightly above the intrawell and interwell prediction limit (0.005 mg/L), and an order of magnitude below the MCL of 0.05 mg/L. Until 2022, selenium had not been detected consistently in the groundwater samples from GWC-4 (Figure 7) when repairs were made to the sedimentation ponds and the Clear Pool that had affected nearby monitoring wells. Although the reported concentrations of selenium observed at GWC-4 are within the range of naturally occurring selenium 0.05 to 0.8 mg/kg in soils across the United States (Smith and Huyck, 1999) and adjacent counties 0.4916 to 0.5801 mg/kg (Shacklette and Boerngen 1984), the concentrations observed at GWC-4 are likely the result of imperfections in the liner of the Clear Pool and associated piping.

Boron is a constituent in CCR materials that is commonly used as an indicator parameter in groundwater monitoring at CCR units because of its behaviour as a conservative (non-reactive) element in groundwater quality (Ruhl 2014). Boron has not been detected historically at GWC-4 (i.e., <0.022 mg/L, Figure 6), with the exception of two J-flagged (i.e., estimated values below the reporting limit) detections in November 2024 and February 2025. Wells adjacent to GWC-4 do not exhibit SSIs indicating that the impact to groundwater is localized to GWC-4 as suggested by the leak detection survey. These facts provide an additional line of evidence indicating that the reported SSIs are not the result of a release from the Cell 1 lined CCR landfill but rather are due to imperfections in the liner of the Clear Pool and associated piping.

In summary, the SSIs reported at GWC-4 are the result of a source other than the Cell 1 lined landfill cell. The Site construction and repair work at the water management facilities outside the landfill waste boundary appears to have affected the groundwater elevations and subsequently the elevated concentrations of barium, calcium, chloride, sulfate, selenium, and TDS at GWC-4 are not the result of a release from within the waste boundary of Cell 1 but rather due to variability in groundwater chemistry caused by a change in recharge conditions and cation exchange reactions. These groundwater chemistry changes are confirmed by the detection of SSIs in wells adjacent to the water management facilities. In regard to the selenium concentrations at GWC-4, the reported SSIs are likely due to imperfections in the Clear Pool and associated piping.

4.2 Electric Liner Leak Detection Survey

Between August 25th and August 28th, 2025, Southern Company Services, Inc. (SCS) procured an electric liner leak (ELL) geophysical survey to investigate whether repairs may be appropriate for the secondary and primary liners of the North Sedimentation Pond and Clear Pool. Results from the geophysical survey, procedures, and methodologies are found in the Technical Report Electric Liner Leak Detection Survey provided by Nova Geotechnologies, LLC and GFT Infrastructure (GFT) provided in Appendix A.

The survey findings include anomalies (spikes in voltage DC readings) in the southeastern corner of the primary and secondary liner system within the Clear Pool. The anomalies likely reflect leakage of water below the clear pool liners and are in the vicinity of the connections of the sump to the liner as well as the sump-riser pipe connections and have been flagged for repair. Results of the leak detection survey suggest the Clear Pool as a possible source of variations in groundwater chemistry observed in well GWC-4. The Clear Pool sump-riser and associated liner connection repairs are currently in design and procurement stage and are expected to be implemented in Q1 2026.

The geophysical survey conducted at the western edge of the North Sedimentation Pond found multiple small dipoles in the data set across the northern part of the study area. The dipoles appear in a quasi-linear pattern from west to east which could potentially represent small discontinuities in the seams of the primary liner system. However, it is important to note that voltages observed are small in magnitude (±5 V). The rest of the pond during this survey was rather flat based on the measured voltage. In addition, the subgrade to interstitial layer investigation yielded an average mV DC reading in the 0 mV DC range with the lone dipole appearing around the pipe culvert section connecting the North Sedimentation Pond and the Clear Pool (transfer pipe). Further review and investigation will be required to determine if repairs are necessary at the North Sedimentation Pond, which will be evaluated following repairs to the sump-riser at the Clear Pool.

The ELL survey data indicate leakage of water from the Clear Pool may be occurring and may be the source of detected SSIs in wells adjacent to the water management facilities, specifically in the limited area around GWC-4.

4.3 Chromium at GWC-7

The concentration of chromium following the February 2025 sampling event in groundwater at GWC-7 (0.024 mg/L) is slightly above the intrawell prediction limit (0.02 mg/L), and below the MCL of 0.1 mg/L (Figure 10). The July 2025 chromium concentration was 0.023 mg/L at GWC-7 (Appendix B). There is no trend observed in the reported concentrations of chromium at GWC-7. However, Cell 1 upgradient wells GWA-16 and GWA-17 do show increasing trends. Further, the July 2025 reported concentration of chromium at monitoring well SGWA-3 upgradient of the Ash Pond unit is 0.028 mg/L, which is greater than the current PL for Cell 1 (Appendix B). As such, the reported concentration of chromium at GWC-7 is representative of natural background concentrations not accounted for in the current upgradient data set.

Review of the piper diagram (Figure 8), shows that the general chemistry at GWC-7, is similar to upgradient groundwater quality and does not suggest influence from the Cell 1 landfill unit. Concentrations of boron at GWC-7 have remained below reporting limits (less than 0.08 mg/L) and no trends are noted. Chloride concentrations in GWC-7 also remain below the interwell PL of 7.2 mg/L (Figure 12). Only calcium and chromium are present at concentrations exceeding statistical limits at GWC-7, other indicator parameters remain below statistical limits. Naturally occurring chromium is prevalent in groundwater from aquifer systems composed of ultramafic rocks, known to have elevated chromium concentrations relative to other rock types. Site-specific geologic investigations and mapping have confirmed the presence of these types of ultramafic rocks in the subsurface underlying Plant Scherer (Golder 2020). Based on these facts, the SSI of chromium at GWC-7 can be attributed to natural variations in groundwater chemistry and not the results of a release from the Cell 1 landfill unit.

4.4 Sulfate at GWC-53

An apparent SSI of sulfate was identified at GWC-53 following the February 2025 sampling event. The sulfate concentration reported at GWC-53 is within historical range of concentrations observed in adjacent and upgradient background well GWA-45. The reported concentration of sulfate at GWC-53 (190 mg/L) is less than 1 mg/L above the prediction limit (189.3 mg/L). A time series plot for sulfate concentrations at monitoring well GWC-53 is shown on Figure 11. No other indicator parameters have exceeded statistical limits at GWC-53. If the SSI of sulfate reported in well GWC-53 was due to a release from the landfill, an increase in multiple indicator parameters would be expected, but this has not been observed. As a result, the increase in sulfate concentration at GWC-53 is attributable to variations in groundwater chemistry.

4.5 Calcium at GWC-7, GWC-9, GWC-19, and GWC-20

An ASD for calcium at GWC-7, GWC-9, GWC-19 and GWC-20 was last submitted on May 1, 2025 (WSP 2025a). Calcium concentrations in February 2025 at monitoring wells GWC-7, GWC-9, GWC-19 and GWC-20 were 19 mg/L, 34 mg/L, 18 mg/L, and 18 mg/L, respectively. GWC-19 was resampled for calcium in April 2025, confirming the original results. These concentrations are within close range to their corresponding intrawell prediction limits (17.69 mg/L, 23 mg/L, 15.99 mg/L, and 17.52 mg/L, respectively). As indicated, the concentrations are only slightly elevated in comparison to their PLs. This slight variance from the PLs is indicative of site-wide changes in chemistry likely due to changes in water level or site construction.

General chemistry of wells showing SSIs for calcium are compared to upgradient groundwater monitoring wells on a piper trilinear diagram presented as Figure 8. Review of the piper diagram shows that the constituent concentrations in wells GWC-7, GWC-9, GWC-19 and GWC-20 are similar to upgradient groundwater quality and

do not indicate influence from Cell 1 or potentially PAC Ash Cell. Overall, the groundwater quality in wells GWC-7, GWC-9, GWC-19, and GWC-20 reflects metal concentrations that are less than an order of magnitude above their respective intrawell/interwell PLs and are comparable to reported background concentrations in site background wells (15 mg/L) and in the nearby Piedmont areas (USGS 2013).

Groundwater elevations in wells GWC-19 and GWC-20 have slightly declined since March 2019 (Figure 3), after the over-excavation and lining of the North Sedimentation Pond. Construction, including the addition of 2,600 feet of underdrain, also occurred at the Site. Construction of the drain, which occurred in December 2019, (Brantley 2020), corresponds to the observed increase is calcium GWC-19 and GWC-20. The decreases in groundwater levels can affect the pH and redox condition in the uppermost aquifer and, subsequently, affect the kinetics of mineral dissolution or precipitation. Groundwater elevations have declined nearly five feet in several of the Site wells (including GWC-19, and GWC-20) since 2019 (Figure 3).

4.6 Sulfate at GWC-3, GWC-6 and GWC-9

SSIs of sulfate have been identified at GWC-3, GWC-6 and GWC-9 following the February 2025 sampling event. The April 2025 resampling event confirmed concentrations of sulfate at GWC-3 and GWC-6. A time series plot for sulfate concentrations at monitoring wells GWC-3, GWC-6, and GWC-9 is shown on Figure 9. Prior ASDs for sulfate were submitted on November 22, 2024, for GWC-6 and on May 1, 2025, for GWC-3 and GWC-9.

General chemistry at GWC-3, GWC-6, and GWC-9 compared to upgradient groundwater monitoring wells is presented on a piper trilinear diagram (Figure 8). Review of the piper diagram shows that GWC-3, GWC-6 and GWC-9 concentrations are similar to upgradient groundwater quality and do not suggest influence from another source (i.e., Cell 1).

Concentration of boron, a primary indicator parameter, has remained low (0.13 mg/L or less) in groundwater from wells GWC-3, GWC-6, and GWC-9 and no trends are noted. Chloride concentrations in these wells have also remained low (7.6 mg/L or less; Figure 12). The majority of the chloride concentrations in GWC-3, GWC-6, and GWC-9 are below the interwell PL of 7.2 mg/L. Chloride concentrations in freshwater range from 1 to 100 mg/L and while there is not a health-based standard, an aesthetic drinking water criteria is established at 250 mg/L.

If the SSIs of sulfate reported in wells GWC-3, GWC-6 and GWC-9 were due to a release from the Cell 1 landfill, an increase in multiple indicator parameters would be expected, notably boron and chloride, which has not been observed. As a result, the increases in sulfate concentration at GWC-3, GWC-6, and GWC-9 are attributed to natural variations in groundwater chemistry.

5.0 CONCLUSIONS

This ASD has been prepared in response to apparent statistical exceedances presented in the *2025 Semi-Annual Groundwater Monitoring and Corrective Action Report, Georgia Power Plant Scherer Cell 1 and PAC Ash Cell*, *Permit No. 102-009D(CCR)*, dated August 29, 2025. In accordance with 40 CFR § 257.94(e) and §391-3-4-.10 of the Georgia Solid Waste Management Rules, this ASD addresses each of the SSIs noted following the February 2025 sampling and the April 2025 resampling events.

Based on the data presented herein, SSIs from the February and April 2025 monitoring/resampling events are not the result of a release of constituents from the lined Cell 1 Landfill, but rather are due to natural variability in groundwater or, changes in groundwater chemistry from lowering of groundwater elevations by construction of the

liner for the North Sedimentation Pond, and in regard to GWC-4, SSIs are due to imperfections in the Clear Pool liner and associated piping outside the Cell 1 landfill boundary. The lines of evidence include:

- An electric liner leak (ELL) detection survey was conducted on the southern half of the North Sedimentation Pond and on the Clear Pool. The ELL survey indicated anomalies in the southeastern corner of the Clear Pool that likely reflect leakage of water below the Clear Pool liners. A southern area of the surveyed portion of the North Sedimentation Pond (Appendix A) also showed minor (± 5 mV) voltage changes.
- Construction and repair of the liner of the North Sedimentation Pond in 2020 has resulted in decreased groundwater elevations in nearby wells and increased concentrations of some constituents in groundwater. The SSIs for barium, calcium, chloride, sulfate, and TDS are likely due to the construction and repair liner of the North Sedimentation Pond.
- The chemical composition of groundwater in Cell 1 wells GWC-3, GWC-6, GWC-7, GWC-9, GWC-19, and GWC-20 is similar to upgradient groundwater (Figure 8).
- Boron, a primary indicator parameter for CCR, does not exhibit an SSI at wells GWC-3, GWC-4, GWC-6, GWC-7, GWC-9, GWC-19, GWC-20, and GWC-53. Considering the lack of boron in wells showing SSI and the similar chemical composition of upgradient and downgradient groundwater, the SSIs of calcium, sulfate, and chromium in the downgradient wells at Cell 1 are due to natural variations in groundwater chemistry. Site-specific geologic investigations and mapping have confirmed the presence of ultramafic rocks in the subsurface underlying Plant Scherer that are known to have elevated chromium concentrations relative to other rock types (Golder 2020).
- The landfill cells have a geosynthetic clay and geomembrane composite liner, and a leachate collection and removal system.

The SSIs noted above are below their MCLs and occur at low concentrations commonly observed in groundwater unaffected by landfill units. Based on the findings presented herein, the Clear Pool sump-riser and associated liner connection repairs are currently in design and procurement. Repairs are expected to be implemented in Q1 2026. Further review and investigation will be required to determine if repairs are necessary at the North Sedimentation Pond and will be evaluated following repairs to the sump-riser at the Clear Pool. Georgia Power will continue with detection groundwater monitoring at Cell 1 and PAC Ash Cell. A copy of this ASD will be included with the forthcoming Annual report.

1. Project Introduction

In July 2025, Southern Company Services, Inc. (SCS) requested that a detailed geophysical study be conducted to evaluate potential liner defects in water filled portions of the North Sedimentation Pond (southern half only) and Clear Pool connected to Landfill Cell #1 at Plant Scherer in Juliette, Georgia. Between August 25th and August 28th, 2025, an electric liner leak (ELL) geophysical survey was performed to investigate potential defects in the secondary and primary liners of the North Sedimentation Pond and Clear Pool. **Figure 1** shows the locations of the Clear Pool and North Sedimentation Pond.

Prior to commencing the ELL surveys, staff from Georgia Power Company (GPC) performed containment and isolation activities to suppress water flow and electrical noise in the study areas. These activities are conducted in attempts to isolate signals potentially associated with liner defects and reduce erroneous sources of electrical noise that would interfere with the ELL survey. Weather conditions during the survey were moderate with temperatures generally between 70°F and 90°F during the survey. No precipitation or electrical storms took place during the survey.

To complete this study, an ELL survey was conducted by Nova Geotechnologies, LLC. (Nova) and GFT, Infrastructure (GFT). The field team for the survey was Michael Zanaty (Nova) and Chris Bryant (GFT). ELL data was electronically transmitted daily to remote Nova staff for same day or overnight initial processing. This process was implemented to provide preliminary quality control (QC) data and to ensure adequate data collection and density.

2. Survey Objectives

The purpose of this geophysical survey was to identify if defects exist within the Clear Pool or the southern portion of the North Sedimentation Pond for both the primary (top liner) and the secondary liners (lower liner). To prepare for the survey, an initial site visit was conducted with Southern Company Services/Georgia Power on August 4, 2025. This meeting was conducted to: (1) ensure the feasibility of conducting an ELL survey at these facilities, (2) ensure plant personnel understood the methodology of the ELL process, (3) ensuring water levels would be down to recommended levels (6 in – 1 ft), and (4) ensure electrical isolation could be achieved.

3. Site Description

This survey was performed at Georgia Power's Plant Scherer located in Juliette, GA. To the east of the Clear Pool is the pump station for the ponds. The liner system used for the construction of the ponds is a double layer of High-Density Polyethylene (HDPE). The primary and secondary liners are constructed with an interstitial layer separating the two, with a leakage detection sump drainpipe (Drawing H1C11005B) that allows the site to pump fluids out of the interstitial zone. Under the secondary HDPE layer is a 24" compacted clay/silt liner that is free of any debris that could puncture or damage the Geo Synthetic Clay Liner (GCL) and or HDPE liner as is noted as the subgrade. The area surveyed for the Clear Pool is 19,335 ft^2 and the area surveyed for the North Sedimentation Pond is 26,642 ft^2. The water coverage in the Clear Pool was roughly 6-in to 2-ft deep and the depth of water in the North Sedimentation Pond was roughly 5-ft.

4. Survey Methodology

Prior to commencing the ELL surveys, staff from Georgia Power Company (GPC) performed containment and isolation activities to stop water flow and isolate electrical noise in the study areas. Containment and isolation activities make sure the applied test current stays within the lined area and the water coverage is uniform. Thus, with proper containment and isolation, anomalies measured can be confidently attributed to liner defects rather than external shorts or bypass paths. ASTM D8265-23 and ASTM D7007-24 detail that the following isolation and containment steps be taken prior to implementing the ELL survey:

1. Electrical Isolation

- **Grounding control**: Ensure that conductive structures (pipes, rebar, risers, anchors) are isolated or accounted for, since they can drain current away.
- **Perimeter isolation**: If the liner is in contact with conductive soils at its edges, trenches or insulation barriers may be installed to prevent leakage of survey current.
- **Power isolation**: Turn off or disconnect site electrical equipment that could introduce noise.

2. Water Containment

- **Containment of applied water**: Prevent water from escaping test areas through seams, drains, or sumps during testing that could be a source of leaking current.
- **Temporary pumping**: Install sumps or pumps to keep the test area water-covered but not overtopped.

The site had excellent electrical isolation during the Clear Pool ELL survey. A bladder was installed into the pipe culvert section between the North Sedimentation Pond and the Clear Pool and a bladder was installed in the pipe culvert between the South Sedimentation Pond and the Clear Pool. Site personnel added a second bladder in the Clear Pool to South Sedimentation Pond pipe culvert section due to water leakage thus not allowing electrical isolation. In addition, solar panels, pumps, and associated piping were disconnected or removed from the survey areas to allow for further electrical isolation.

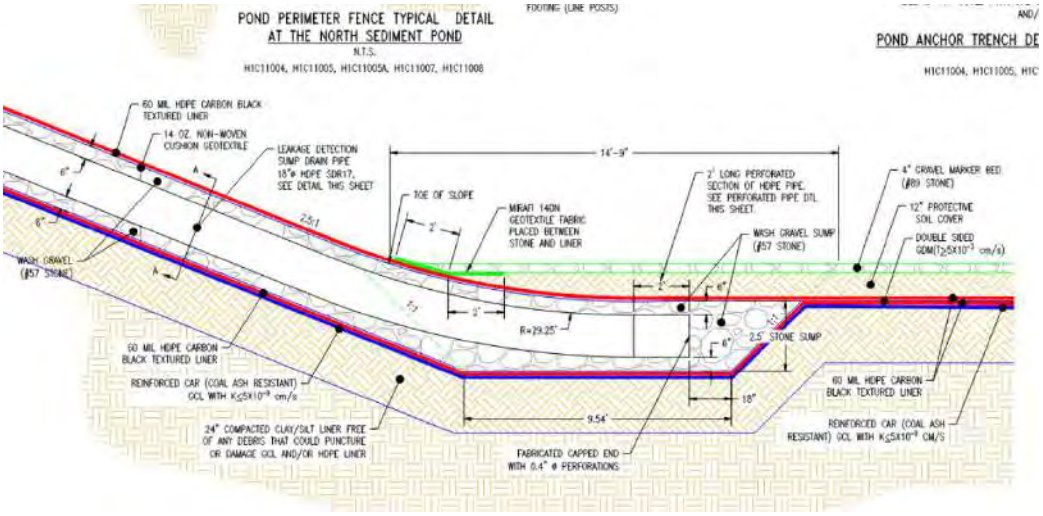
The geophysical method used for this survey was an Electric Liner Leak (ELL) setup and survey was performed to ASTM standards, ASTM D8265-23 and ASTM D7007-24. Using ELL survey skids constructed by Nova (**Inset 1**), non-polarizing $CuSo^4$ half-cells (6A manufactured by Tinker and Rasor)

were spaced less than 5 ft apart, saturated with $CuSO^4$ and distilled water, and capped with watertight caps (Tinker and Rasor W-7 waterproof adapters). Two types of voltage measurement devices (Fluke model 117 multimeter and a Mooshimeter wireless multimeter) were used to display the voltage between the 2 half cells and was mounted to the ELL survey skids, this multimeter data was recorded in Millivolts direct current (mV DC). Positioning data was collected using Emlid Reach RS3 GPS systems following a grid pattern in a north to south orientation for the Clear Pool and east to west for the North Sedimentation Pond.

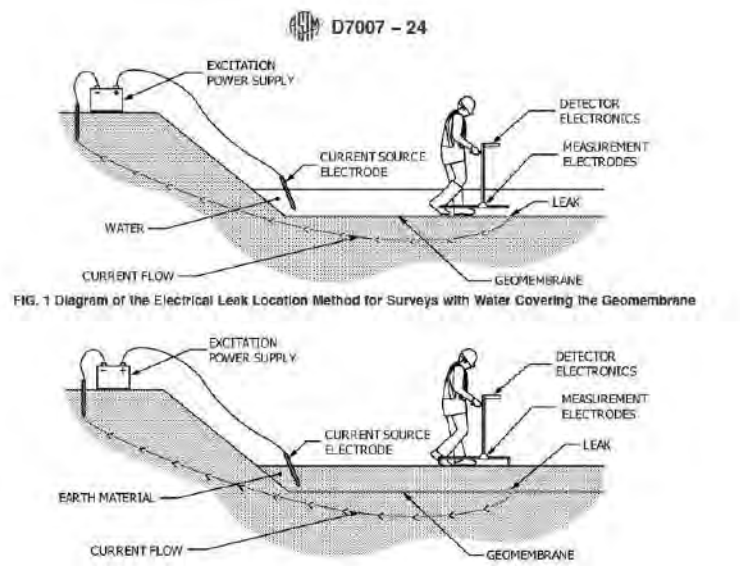
Inset 1. Skid Made by Nova Geotechnologies.

QA/QC methods following ASTM standards D7007-24 and D8265-23 were conducted every day and before and after every survey to ensure that the instruments used were still working appropriately. The QA/QC procedures ensured that each half cell used contained the proper amount of $CuSO^4$ and water prior to surveying. In addition, prior to surveying the field crew verified continuity from the half-cell to Fluke model 117 meter (resistance less than 5k ohms confirmed circuit). The field team also collected calibration points with GPS (both skids/meters) prior to and after each survey (per survey – defined as test of each liner system) to be used for comparing meters readings and leveling between meters if needed. Visual inspection of the ponds was completed before each survey to ensure electrical isolation. During the North Sedimentation Pond ELL survey, the field team could not confirm electrical isolation due to water level obscuring the bladder and pipe culvert installed between the pipe culvert section between the North Sedimentation Pond to the Clear Pool (Drawing H1C11017) and the high-water level obscuring the pipe.

GFT used an Allied Geophysical High Voltage Power Supply to induce voltage into a electrode placed under the secondary liner into the subgrade, below the secondary HDPE layer and then into the interstitial layer (current source electrode), via the leakage detection sump drainpipe, to survey the secondary liner. (**Inset 2**) Then to survey the primary liner the electrodes were moved from the subgrade into the water in the Clear Pool/ North Sedimentation Pond (current source electrode) and the interstitial layer electrode was left in place (**Inset 3**).



Inset 2. Schematic of the sump drainpipe and liners leading into the North Sedimentation Pond.



Inset 3. Diagram of the Electrical Leak Location Method for Surveys with Earthen Material Covering the Geomembrane (ASTM_7CD7007-24_7Cen-US)

Fiducial measurements were collected using the Emlid Flow App to collect the GPS point and voltage readings were input in the description field. The measurement tools used were a Mooshimeter for one skid and a Fluke model 117 for the other skid, an Allied Associates Geophysical Ltd – High Voltage Power Unit to induce voltage into the 36” stainless steel electrodes that were placed in the interstitial zone and either under the secondary liner (subgrade) or on top of the primary liner (in the pool/pond water on top of the primary liner).

5. Data Acquisition and Processing

Data acquisition procedures in the Clear Pool and the North Sedimentation Pond varied due to the water levels that could be established by plant personnel. The Clear Pool had a sump pump (pumping about 50gpm) which was removed for the survey. The water was drained from the sump and piping down to about 1 ft (**Inset 4)** in the Clear Pool, whereas the North Sedimentation Pond did not have an active pump in it as this Pond is only used for overflow. The North Sedimentation Pond could not be drained below the bottom of the pipe culvert that connects the Clear Pool to the North Sedimentation Pond.

There was an attempt to keep data density high and spacing consistent across the two ponds. In the Clear Pool, a spacing of about 5 ft (~ half-cell separation on skid) was used between north – south transects. Through this transect spacing a grid of data was acquired for both surveys performed in the Clear pool. In the North Sedimentation Pond an ELL survey skid was attached to the boat, because of wind and length of transects, these transects complicated the spacing of transects and data acquired (**Inset 5)**. Once the first data collection process was finished the positioning data was reviewed and if any areas that were not sufficiently covered were then filled in with additional ELL data.

Inset 4. Clear Pool Survey Data acquisition depth of 1 – 2 ft.

Inset 5. Fluke model 117 attached to skid attached to boat for surveying the North Sedimentation Pond.

ASTM standards document D7007-24 "Standard Practices for Electrical Methods for Locating Leaks in Geomembranes Covered with Water or Earthen Materials" section 5.3 covers various QA/QC procedures to verify the instruments were working properly, that voltage was flowing to assess the liner, and there was continuity in the power supply and between the measurement electrodes on the survey skids. Calibration measurement locations were installed for each pond/pool and were surveyed before and after each survey where two ELL survey skids were utilized in parallel with the survey direction decided for the pond (East-West for the North Sedimentation Pond and North-South for the Clear Pool).

ELL data recorded in data loggers (EMLID Reach RS3) were exported to csv and initially processed in excel. Raw files were preserved in a "raw file folder". Raw data files were merged into a single csv file for the Clear Pool where multiple data loggers were used. For the North Sedimentation Pond, this was not necessary as only a single data logger was used.

For the Clear Pool, a QC test point was utilized to level voltage readings between the Mooshimeter and the Fluke 117 multimeter. QC corrections were applied to Mooshimeter readings to scale readings to that of the Fluke 117 multimeter. Additionally, a leveling correction was applied to Mooshimeter data collected on 8/27/2025 (interstitial layer to primary liner) to more completely level the data set between multimeters. **Table 1** presents scaling and leveling corrections applied to Clear Pool data sets.

Table 1. Clear Pool QC Corrections and Leveling

Liner	Date	Meter	QC In (mV DC)	QC Out (mV DC)	Applied QC Correction (mV)	QC Correction Method	Leveling Adjustment (mV)
Secondary	8/26/25	Fluke 117	1	--	0	--	0
Secondary	8/26/25	Mooshi	-20.5	1	21.5	Difference	0
Primary	8/27/25	Fluke 117	1	1	0	--	0
Primary	8/27/25	Mooshi	-5.5	-6	11.25	Avg. Difference	-250

Processing was completed using Golden Software Surfer Beta 30.0.188 64-bit which is a contouring, gridding and 3D surface mapping software. Natural Neighbor Interpolation (also called Sibson interpolation) is a geospatial interpolation method used to estimate values at unknown locations based on surrounding known data points. With the natural neighbor method, a Voronoi diagram is built from the known sample points. Each point “owns” a cell of space closest to it. When a new (interpolation) point is added, it takes space from some of those neighboring Voronoi cells. The interpolated value is calculated as a weighted average of the neighboring points, where the weights are proportional to the amount of cell area “stolen” from each neighbor. Advantages of the natural neighbor method are that only nearest data points influence the result and it can naturally account for irregular data spacing. When necessary, low pass filtering was applied to gridded data sets to smooth contours.

6. Results & Interpretation

This section will be broken into two parts regarding the interpretation of the North Sedimentation Pond and the Clear Pool. Anomalies that require further investigation in the liners are noted by either a sharp change between polarities observed such as going from a positive to a negative reading rapidly (a dipole) or a very high voltage recording. Using ASTM D8265-23 and ASTM D7007-24 as guidelines for interpretation, the following should be considered when evaluating ELL data:

Anomaly criteria:

- Sharp, localized potential anomalies (typically >5–10x background).
- Symmetry or "bullseye" pattern in equipotential contours.

Differentiate false positives:

- Edge effects (strong signals at perimeter).
- Metallic debris or grounded objects.
- Confidence in containment/isolation.

A. Clear Pool

The Clear Pool was surveyed at a depth average of 1 ft., giving an optimal survey depth for ELL data acquisition. Two 36" stainless steel electrodes were used to induce current, one electrode was placed under the secondary liner (**Inset 6**), while the other electrode was placed into the Interstitial layer by going through the Subgrade to Interstitial Liner.

Inset 6. 36" Stainless Steel Electrode Under Secondary Liner.

Interstitial to Primary Liner – To investigate the primary liner system of the Clear Pool, the current electrode was placed into the water in the northwestern corner of the Clear Pool while the reference electrode was in the interstitial layer. **Figure 2** illustrates the voltage contour map of the Clear Pool generated for the interstitial to the primary liner survey. Draft voltage contour mapping indicates a large spike in voltage DC readings in the southeastern corner of the Clear Pool. The main areas of concern regarding anomalies flagged for further investigation are the connections of the sump to the liner as well as the sump-riser pipe connections, with the latter having readings nearby of up to 3000mV DC. While the southeastern corner of the Clear Pool had many high voltages recorded the rest of the Clear Pool was relatively flat regarding measured voltages across the survey area.

Subgrade to Interstitial – To investigate the secondary liner system of the Clear Pool, the current electrode was placed into the interstitial layer and the reference electrode placed into the subgrade. **Figure 3** illustrates the Clear Pool voltage contour map for measurements between the subgrade and interstitial liners. Draft voltage contour mapping indicates a large spike in voltage DC readings in the southeastern corner of the Clear Pool. The main areas of concern regarding anomalies flagged for further investigation are the connections of the sump to the liner as well as the sump-riser pipe connections, with the latter having readings nearby of up to 3000mV DC. While the southeastern corner of the Clear Pool had many high voltages recorded the rest of the Clear Pool was relatively flat regarding measured voltages across the survey area. The voltages observed in this survey were lower than found in the initial survey (primary liner

survey) but still had spikes in the southeastern corner of the Clear Pool providing evidence there are anomalies there that require further investigation.

B. North Sedimentation Pond

Only southern portions of the North Sedimentation Pond were a part of this scope of work. The North Sedimentation Pond was surveyed with a water depth of about 5 ft necessitating the use of the john boat to acquire the data. The Fluke model 117 skid was attached to the side of the john boat using two C-clamps and aligned with the Emlid Reach RS3 to acquire the data. The field team could not confirm electrical isolation due to water level obscuring the bladder and pipe culvert installed between the pipe culvert section between the North Sedimentation Pond to the Clear Pool (Drawing H1C11017) and the high-water level obscuring the pipe.

Interstitial to Primary Liner –To investigate the primary liner system of the North Sedimentation Pond, the current electrode was placed into the water along the western edge of the North Sedimentation Pond, while the reference electrode was placed in the interstitial layer. **Figure 4** exhibits the voltage contour map generated for the interstitial to primary liner. The elevated voltage readings to the west correlate with the current electrode and radial decay of current away from the current electrode. As shown in **Figure 4**, multiple small dipoles are observed in the data set in the northern part of the study area. These dipoles appear in a quasi-linear pattern from west to east which could potentially represent small discontinuities in seams of the liner system. However, it is important to note that voltages observed are small in magnitude (+/- 5 V). The rest of the pond during this survey was rather flat based on the measured voltage.

Subgrade to Interstitial Layer - To investigate the secondary liner system of the North Sedimentation Pond, the current electrode was placed into the interstitial layer while the reference electrode was placed in the subgrade. **Figure 5** shows the voltage contour map generated for the subgrade to interstitial layer (secondary liner). The average mV DC readings were around 0 mV DC with the lone dipole appearing around the pipe culvert section connecting the North Sedimentation Pond and the Clear Pool (transfer pipe).

7. Recommendations

The figures (**Figures 2-5**) representing each set of survey data acquired highlight areas that need further investigation into the liners at those locations. A summary of anomaly locations is also presented in **Appendix A**. In comparing the results of the Clear Pool and North Sedimentation Pond, the anomalies observed in the Clear Pool demonstrate higher voltages potentially symptomatic of larger discontinuities. Upon review of the data and repairing mapped anomalies a follow-up survey is recommended for the Clear Pool. Per ASTM D8265 current will flow preferentially through larger leaks in the liner with smaller leaks not being detected due to this.

Anomalies in the North Sedimentation Pond were typically much lower in magnitude, potentially representing smaller discontinuities.

8. Limitations & Closing

Nova and GFT's ELL services are conducted in a manner consistent with the level of care and skill ordinarily exercised by other members of the geophysical community currently practicing under similar conditions subject to the time limits and physical constraints applicable to the services. Furthermore, it is possible that interpreted features, may upon intrusive sampling, prove to have been misinterpreted or mislocated. Where interpretation from geophysical data is an important element for cost or safety of operations, it should always be checked for reasonableness against known or expected subsurface data and verified at critical locations by physical means such as probing or exposing. Although this geophysical survey has been completed, standard of care must still be exercised while excavating and during construction activities.

Thank you for the opportunity to present this report and recommendations. Please let us know if you have questions or would like to discuss the contents of these recommendations. This page certifies the preparation, review, and approval of this report.

Login Number: 38046
List Number: 1
Creator: Hartley, Tyler

List Source: Eurofins Atlanta

Question	Answer	Comment
The cooler's custody seal, if present, is intact.	True	
The cooler does not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Sample custody seals, if present, are intact.	True	
Sample collection date/times are provided.	True	
The samples do not appear to have been compromised or tampered with.	True	
Containers are not broken or leaking.	True	
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Appropriate sample containers were rec'd and sufficient volume for all analyses.	True	
Samples are received within Holding Time (excluding tests with immediate HTs).	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Is there sufficient air space in bottle for bacteriological analysis.	True	

Definitions/Glossary

Client: Southern Company

Project/Site: Plant Scherer - Cell 1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 705-38046-1 — Eurofins Atlanta

Job Narrative
705-38046-1

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The samples were received on 7/28/2025 3:31 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.4°C and 3.1°C.

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B - Total Recoverable: The method blank for preparation batch 705-72359 and analytical batch 705-73109 contained Barium, Calcium, Nickel and Potassium above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6020B - Total Recoverable: The method blank for preparation batch 705-72359 contained Zinc above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

Method 6020B - Total Recoverable: The method blank for preparation batch 705-72359 and analytical batch 705-73875 contained Potassium above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Vanadium	**0.017**		0.0050	0.0012	mg/L		08/04/25 16:35	08/07/25 00:32	1
Zinc	<0.0089		0.010	0.0089	mg/L		08/04/25 16:35	08/07/25 00:32	1

Method: SW846 7470A - Mercury (CVAA)

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
Mercury	<0.00017		0.00020	0.00017	mg/L		08/11/25 08:57	08/11/25 15:10	1

General Chemistry

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
Total Alkalinity as CaCO3 (SM 2320B-2011)	**100**		3.0	3.0	mg/L			08/04/25 15:02	1
Bicarbonate Alkalinity as CaCO3 (SM 2320B-2011)	**100**		3.0	3.0	mg/L			08/04/25 15:02	1
Carbonate Alkalinity as CaCO3 (SM 2320B-2011)	<3.0		3.0	3.0	mg/L			08/04/25 15:02	1
Total Dissolved Solids (SM 2540C - 2015)	**210**		10	10	mg/L			07/30/25 14:45	1

Method Summary

Client: Southern Company
Project/Site: Plant Scherer - Cell 1

Job ID: 705-38046-1

Method	Method Description	Protocol	Laboratory
300.0	Anions, Ion Chromatography	EPA	EET ATL
6010D	Metals (ICP)	SW846	EET ATL
6020B	Metals (ICP/MS)	SW846	EET ATL
7470A	Mercury (CVAA)	SW846	EET ATL
2320B-2011	Alkalinity, Total	SM	EET ATL
2540C - 2015	Total Dissolved Solids (Dried at 180 °C)	SM	EET ATL
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET ATL
3010A	Preparation, Total Metals	SW846	EET ATL
7470A	Preparation, Mercury	SW846	EET ATL

Job Notes

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Login Sample Receipt Checklist

Client: Southern Company

Job Number: 705-38041-1

Login Number: 38041
List Number: 1
Creator: Hartley, Tyler

List Source: Eurofins Atlanta

Question	Answer	Comment
The cooler's custody seal, if present, is intact.	True	
The cooler does not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Sample custody seals, if present, are intact.	True	
Sample collection date/times are provided.	True	
The samples do not appear to have been compromised or tampered with.	True	
Containers are not broken or leaking.	True	
There are no discrepancies between the containers received and the COC.	True	
Sample containers have legible labels.	True	
Appropriate sample containers were rec'd and sufficient volume for all analyses.	True	
Samples are received within Holding Time (excluding tests with immediate HTs).	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Is there sufficient air space in bottle for bacteriological analysis.	True	

This receipt checklist is generated for all samples received in this Login. It may not be applicable to all Jobs associated with this Login.

Definitions/Glossary

Client: Southern Company
Project/Site: CCR - Plant Scherer Ash Pond

Job ID: 705-38041-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job ID: 705-38041-1 Eurofins Atlanta

Job Narrative
705-38041-1

Revision 1
The report being provided is a revision of the original report sent on 8/15/2025. The report is being revised in order to document changes requested by WSP during login review of this submittal.

Project Manager Comments
Per request by WSP during login review, Client Sample ID, SCH-SGWA-18, should be renamed as SCH-SGWC-18 and also Iron should be added to the metals reporting list.

The analytical test results presented in this report meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page, unless otherwise noted. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable. Regulated compliance samples (e.g. SDWA, NPDES) must comply with associated agency requirements/permits.

- Matrix-specific batch QC (e.g., MS, MSD, SD) may not be reported when insufficient sample volume is available or when site-specific QC samples are not submitted. In such cases, a Laboratory Control Sample Duplicate (LCSD) may be analyzed to provide precision data for the batch.
- For samples analyzed using surrogate and/or isotope dilution analytes, any recoveries falling outside of established acceptance criteria are re-prepared and/or re-analyzed to confirm results, unless the deviation is due to sample dilution or otherwise explained in the case narrative.

Receipt
The samples were received on 7/25/2025 3:32 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.2°C and 1.6°C.

HPLC/IC
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
Method 6020B - Total Recoverable: The method blank for preparation batch 705-72342 and analytical batch 705-72752 contained Potassium above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C: A lesser volume of sample was used for the following sample due to the nature of the sample matrix resulting in elevated reporting limits: SCH-SGWC-18 (705-38041-8),

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Detection Summary

Total Dissolved Solids (SM 2540C - 2015)	**1300**		20	20	mg/L			07/30/25 12:45	1

Method Summary

Client: Southern Company
Project/Site: CCR - Plant Scherer Ash Pond

Job ID: 705-38041-1

Method	Method Description	Protocol	Laboratory
300.0	Anions, Ion Chromatography	EPA	EET ATL
6010D	Metals (ICP)	SW846	EET ATL
6020B	Metals (ICP/MS)	SW846	EET ATL
7470A	Mercury (CVAA)	SW846	EET ATL
2320B-2011	Alkalinity, Total	SM	EET ATL
2540C - 2015	Total Dissolved Solids (Dried at 180 °C)	SM	EET ATL
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET ATL
3010A	Preparation, Total Metals	SW846	EET ATL
7470A	Preparation, Mercury	SW846	EET ATL
