Within Limit

Prediction Limit

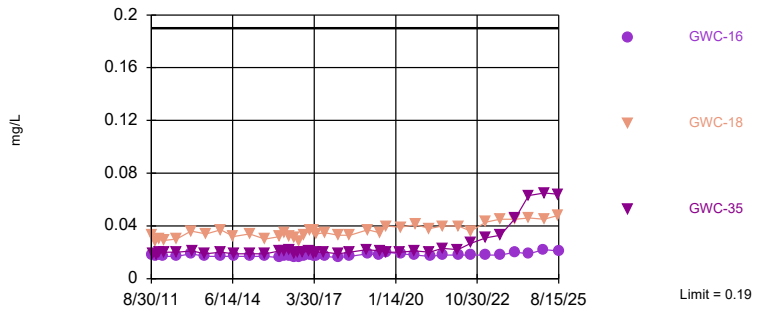
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 211 background values. 14.22% NDs. Annual per-constituent alpha = 0.002834. Individual comparison alpha = 0.00004893 (1 of 2). Comparing 3 points to limit. Assumes 26 future values.

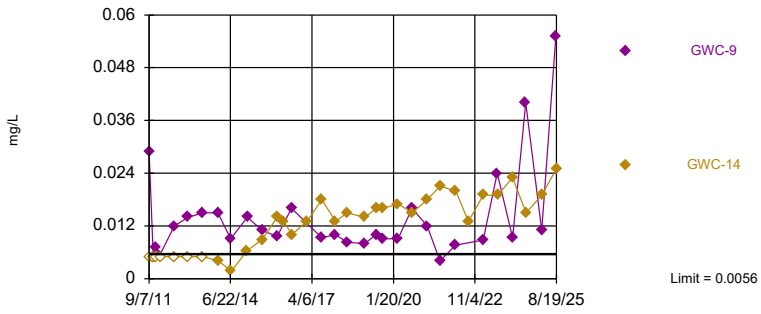
Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-9, GWC-14

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 177 background values. 42.37% NDs. Annual per-constituent alpha = 0.003622. Individual comparison alpha = 0.00006255 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

Constituent: Nickel Analysis Run 10/27/2025 5:08 PM View: Appendix I - Interwell - Two Step

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.
Within Limit

Prediction Limit

Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 154 background values. 17.53% NDs. Annual per-constituent alpha = 0.004784. Individual comparison alpha = 0.00008267 (1 of 2). Comparing 4 points to limit. Assumes 25 future values.

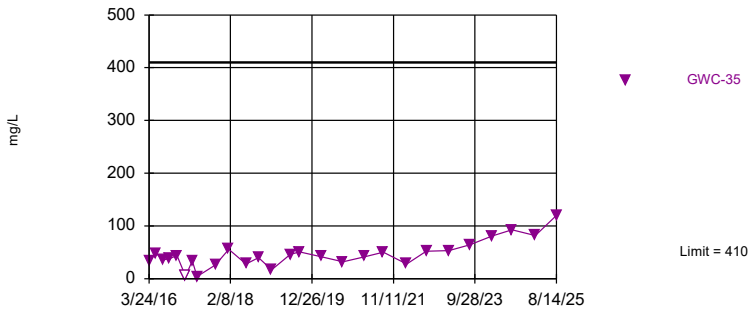
Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 153 background values. 6.536% NDs. Annual per-constituent alpha = 0.004849. Individual comparison alpha = 0.00008381 (1 of 2). Assumes 28 future values.

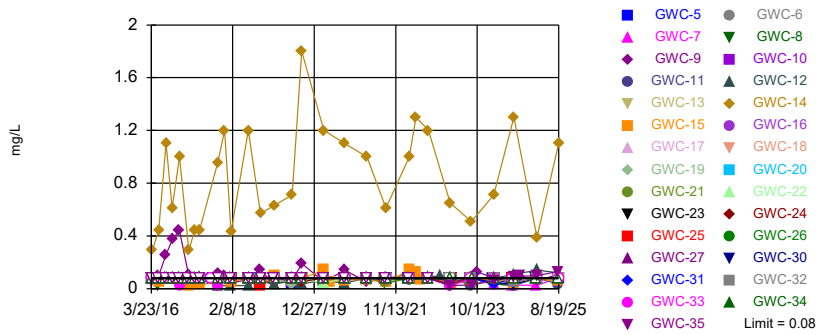
Hollow symbols indicate censored values.

Exceeds Limit: GWC-9, GWC-12, GWC-14, GWC-35

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 154 background values. 97.4% NDs. Annual per-constituent alpha = 0.004784. Individual comparison alpha = 0.00008267 (1 of 2). Comparing 29 points to limit.

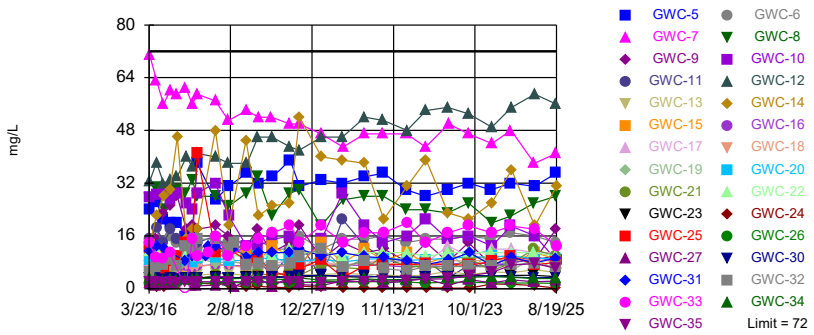
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 155 background values. Annual per-constituent alpha = 0.004718. Individual comparison alpha = 0.00008154 (1 of 2). Comparing 29 points to limit.

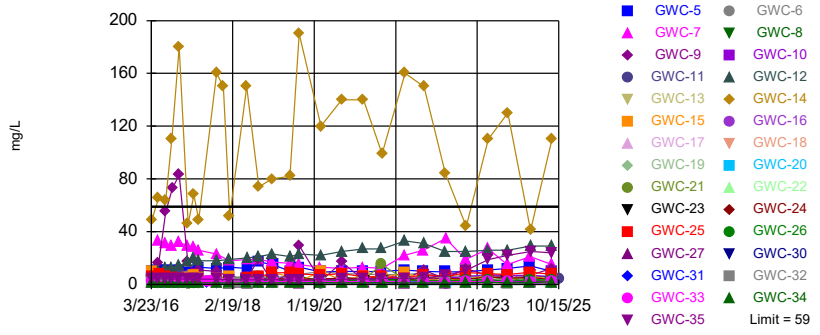
Exceeds Limit: GWC-14

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 155 background values. 1.29% NDs. Annual per-constituent alpha = 0.004718. Individual comparison alpha = 0.00008154 (1 of 2). Comparing 29 points to limit.

Constituent: Chloride Analysis Run 10/27/2025 5:32 PM View: Appendix III - Interwell
Plant Wansley Client: Southern Company Data: Wansley Landfill

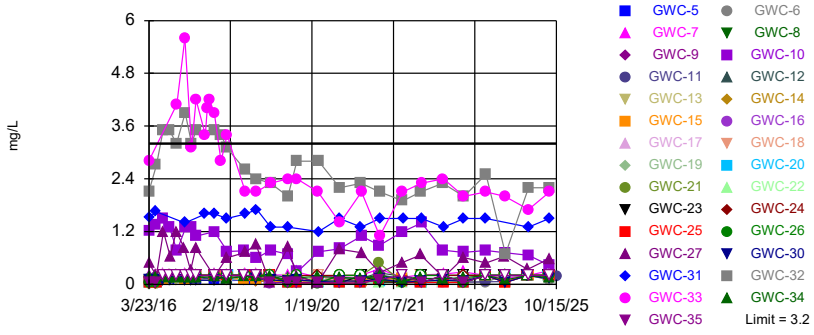
Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 153 background values. 41.83% NDs. Annual per-constituent alpha = 0.004849. Individual comparison alpha = 0.00008381 (1 of 2). Comparing 29 points to limit.

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) Addendum has been prepared to address statistically significant increases (SSI) identified in the groundwater monitoring network at the Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the Site) following the second semiannual detection monitoring event of 2024. The SSIs were identified for Appendix III constituent boron at detection monitoring well GWC-9 and GWC-35. An ASD addressing boron at GWC-9 was previously submitted to Georgia Environmental Protection Division (EPD) in 2018 (ACC, 2018) and 2024 (ACC, 2024). The complete 2024 ASD is provided as Appendix A. This ASD Addendum has been prepared pursuant to 40 Code of Federal Regulations (CFR) 257.94(e)(2).

The Site, located in northeast Heard County and southeast Carroll County, Georgia, is comprised of three cells within an approximate 73-acre footprint (Figure 1). The landfill is permitted to operate by the Georgia EPD Solid Waste Handling Permit No. 074-005D(CCR). In preparation for CCR Landfill Expansion-Cell 4 (Georgia EPD Online System - GEOS Submittal ID: 893827), which is currently still in the permitting process, the Site has proactively removed all CCR from cells 1 and 2.

In July 2024, a semiannual detection monitoring event was conducted at the Site (ACC, January 2025) in accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 CFR 257 Subpart D; published in 80 Federal Register 21302-21501, April 17, 2015) and the Site's EPD-approved *Groundwater Monitoring Plan* (HHNT, 2022). As a result of the statistical analysis, performed by Groundwater Stats Consulting (GSC), verified SSIs for the Appendix III constituent boron were identified at detection groundwater monitoring wells GWC-9 and GWC-35 (See Figure 2 for the well locations). These two SSIs are the subject of this Addendum.

2.0 ALTERNATE SOURCE DEMONSTRATION

This ASD Addendum builds on information provided in the 2018 and 2024 ASDs. Because the CCR Unit has a high-density polyethylene (HDPE) liner and leachate collection system, it is unlikely that the CCR Unit is the direct source of groundwater impact and the boron SSIs reported at wells GWC-9 and GWC-35 are not associated with a release from the CCR unit. The following sections provide specific demonstrations to support this ASD Addendum such as a previous operational issue related to dust suppression, upgradient drilling field activities, and natural variation in groundwater quality.

2.1 Alternate Source Review for GWC-9

2.1.1 Dust Suppression

As mentioned in the 2018 and 2024 ASDs (Appendix A), during drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond) for road dust suppression. This retention pond water had been treated prior to use for dust suppression; however, it may have exhibited slightly different chemical characteristics than the dust suppression water used during non-drought conditions. This may have accounted for the 2016 boron increases and subsequent decline after the drought ended, and the data supports this as the concentration of boron declined after 2017. An operational issue related to dust suppression is the likely primary source for the initial 2016 concentrations of boron found in GWC-9.

2.1.2 Natural Variation in Groundwater Quality

The low-level boron concentrations at GWC-9 have shown variability between 2016 through July 2024, with ranges from non-detect (ND) [March 2022] to 0.44 milligrams per liter (mg/L) [November 2016], as shown on Figure 3. Overall, the concentration of boron in GWC-9 has declined since the November 2016 peak value of 0.44 mg/L. GWC-9 was sampled on July 31, 2024, for the 2024 semiannual groundwater sampling event. The concentration of boron for that sampling event was 0.088 mg/L which is slightly above the site prediction limit (0.080 mg/L). A verification resample was collected for boron in September 2024, which verified the SSI concentration for GWC-9 at 0.089 mg/L. GWC-9 was sampled on February 18, 2025, for the semi-annual groundwater sampling event. The concentration of boron for that sampling event is an estimated “J” value of 0.059 mg/L, which is below the site prediction limit, as shown in Table 1, and illustrates the low-level nature of boron concentrations in GWC-9. There is no maximum contaminant level (MCL) established for boron, but concentrations of boron in GWC-9 have been well below the USEPA Regional Screening Level of 4.0 mg/L. February 2025 laboratory analytical data report J262079 is provided in Appendix B.

There is spatial variability in levels of boron in the area. For example, a review of adjacent Plant Wansley Ash Pond 1 data shows that the site background concentrations for boron at the Ash Pond is 0.10 mg/L (Georgia Power Company, 2024). This boron concentration was from monitoring well WGWA-18 during the August

2021 sampling event. This background concentration is higher than the site background concentration for boron at the Plant Wansley CCR Landfill which is 0.080 mg/L. This demonstrates that background concentrations of boron at Plant Wansley, while low-level, are spatially variable. The initial boron concentration of 0.088 mg/L for GWC-9 during the second 2024 semiannual sampling period was below the site background at Ash Pond 1 and, would not be calculated as a statistical increase at Ash Pond 1. Additionally, the GWC-9 February 2025 boron concentration of 0.059 (J) mg/L would not be a calculated SSI at Ash Pond 1 or the Landfill.

The variation in the concentration of boron in GWC-9 is attributed to fluctuations in groundwater elevations. As shown in Figure 4, boron concentrations in GWC-9 show an inverse correlation when compared to minor changes in groundwater elevations. As the sampled groundwater elevations decrease, the concentration of boron increases and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9 (Appendix C), as discussed in the following section. Additionally, as shown in Figure 4, the concentration of boron increases when the sampled groundwater elevation at GWC-9 is below 704.5 feet Mean Sea Level. Boron's natural occurrence in soils is also supported by the fact that CCR leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.

2.1.3 Geochemical Characterization

A Piper diagram (Figure 5) was created from the groundwater data collected during the February 2024 semiannual sampling event. Displayed on the figure is a highlighted section in which typical CCR leachate would plot on the diagram based upon fine ash leaching research (Zielke-Olivier and Vermeulen, 2019). Figure 5 shows that the water types displayed by the upgradient groundwater wells and downgradient groundwater well GWC-9 data are generally similar and are not indicative of CCR source water. As demonstrated in the figure, the data for GWC-9 is similar to the data for upgradient well GWA-2. In general, the data for GWC-9 plots in similar areas of the diagram as the rest of the upgradient monitoring wells at the Site and in a different area than typical coal ash leachate.

GWC-14 was included in Figure 5 for comparison purposes. A boron SSI was also confirmed in GWC-14 during the February 2024 reporting period. However, the boron SSI in GWC-14 has been addressed by an August 2022 ASD Addendum, which has been approved by Geogia EPD. The cause of the SSIs for GWC-14 has been attributed to a one-time occurrence of an aboveground expansion joint failure that was directly upgradient of GWC-14 and not a release from the CCR unit. This incident has impacted GWC-14 with leachate that was being transferred from the return water pond through the return water dual wall pipes to the plant used for operational purposes. If GWC-9 is being impacted from leachate from the landfill, GWC-9 and GWC-14 would exhibit similar geochemical signatures. However, as displayed in Figure 5, GWC-9 does not plot near GWC-14 and instead plots similarly to background wells at the Site. The geochemical plot of water type displayed for GWC-14 is closer to the typical coal ash

leachate area of the diagram. Because GWC-9 plots in a different area than GWC-14, it suggests that GWC-9 is not being impacted by the CCR Unit.

Stiff diagrams in Figure 6 generally support the data derived from the Piper plots in Figure 5, showing water types not indicative of CCR leachate. Bicarbonate ions are similar in upgradient well GWA-2 and downgradient well GWC-9, suggesting similar natural groundwater type in both upgradient and downgradient wells. Additionally, as with Figure 5, GWC-14 has been included in Figure 6 for comparison purposes. The stiff diagrams for GWC-9 and GWC-14 do not display similarities which further suggests that GWC-9 is not being impacted by the CCR Unit.

The United States Geological Survey (USGS) National Geochemical Database (NGDB) shows that the USGS took several hard rock samples at locations around Plant Wansley in 1967, which predates CCR placement at the Wansley Landfill. USGS sample locations AEW095, AEW096, AEW087, and AEW088 each contained boron at concentrations of 50, 20, 50, and 10 parts per million (ppm) by weight, respectively. Of those locations, AEW095 and AEW096 are located nearest Wansley Landfill, as shown in Figure 7, and are within, or near, the same geological layer (granitic gneiss) as GWC-9. Uppin and Karro (2013) state that one factor controlling the groundwater chemistry is the lithological composition of water-bearing rocks and that the presence of boron bearing minerals in the host rock and their interaction with water are considered to be the main cause of boron enrichment in groundwater. Under wetter conditions, the groundwater elevation rises which will raise the weathering profile. During times of drier weather, the groundwater elevation will fall. Above the water table, gases (such as oxygen) have greater access to the regolith in the form of intergranular space and conditions are typically more oxidizing (McQueen & Scott, 2008). Water moving through these areas will transport the dissolved and suspended components (such as boron) and lead to strong leaching with further intergranular space formation. The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron-containing bedrock and fluctuations in groundwater elevation. As stated in the previous section, as groundwater elevations decrease, the concentration of boron increases, and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9.

The dataset observed for GWC-9 is consistent with a one-time, transient event resulting from an operational issue related to dust suppression and ongoing naturally occurring interactions between a geological layer and lower groundwater elevation. As stated in the introduction, all CCR has been removed from Cells 1 & 2. Additionally, the concentration of boron during the February 2025 sampling event is not an SSI.

2.2 Alternate Source Review for GWC-35

2.2.1. Natural Variation in Groundwater Quality

Boron was first detected in GWC-35 in the 2023 groundwater sampling events as estimated “J” values of 0.024 mg/L (February 2023) and 0.028 mg/L (August 2023) at concentrations above the laboratory method detection limit but below the reporting

limit. GWC-35 was sampled on August 5, 2024, for the 2024 annual groundwater sampling event. The concentration of boron for that sampling event was 0.093 mg/L which is slightly above the site prediction limit (0.080 mg/L). A verification resample was collected for boron in September 2024, which verified the SSI concentrations for GWC-35 at 0.094 mg/L. GWC-35 was sampled on February 18, 2025, for the semi-annual groundwater sampling event, and boron was observed at a concentration of 0.10 mg/L, consistent with the previously observed concentration in August 2024 and still only slightly above the site prediction limit. This indicates that the concentration of boron in GWC-35 may be peaking. There is no MCL established for boron, but concentrations of boron in GWC-35 have been well below the USEPA Regional Screening Level of 4.0 mg/L.

As discussed in Section 2.1.2, boron concentrations at Plant Wansley are spatially variable. Site background concentrations for boron at Ash Pond 1 are slightly greater than the Landfill, and the boron concentration of 0.093 mg/L for GWC-35 during the second 2024 semiannual sampling period was below the site background at Ash Pond 1 and the February 2025 boron concentration of 0.10 mg/L equals site background at Ash Pond 1. Neither concentration would be calculated as a statistical increase at Ash Pond 1.

2.2.2. Geotechnical Drilling

A review of Wansley Landfill's Site Acceptability Report (Geosyntec, 2023) shows that two geotechnical borings were drilled hydraulically upgradient of GWC-35 (GS-106 and GS-107), as shown in Figure 8. Additionally, Cross Section B-B' (Figure 9) shows the groundwater elevation at GS-107 at a higher groundwater elevation which descends to GWC-35 and confirms that the boring is hydraulically upgradient of GWC-35. As stated in Section 2.1.3, site-specific data confirms that geological layers at the Site contain naturally occurring boron. As shown in Figure 7, the geological layer that was sampled by the USGS in 1967 contains boron (granitic gneiss) is also found at GS-106, GS-107, and GWC-35. The geotechnical borings were drilled into bedrock (granitic gneiss), as shown in their boring logs (Appendix C). Naturally occurring boron, as well as other compounds, present within the crystalline structure of granitic gneiss can become mobilized when disturbed during drilling activities. The physical action of drilling fractures and pulverizes mineral matrices increasing the surface area exposed to groundwater which was previously shielded from weathering agents. Mechanical disruption facilitates temporary chemical interactions, allowing boron-containing minerals to more readily dissolve or leach into the groundwater. Studies have shown that boron can be leached from bedrock by dissolution through contact time and mixing rate (Tabelin et al., 2014). Consequently, boron concentrations in groundwater may be temporarily elevated compared to undisturbed baseline conditions. Typically, these concentrations will stabilize or decrease once the disturbed material re-equilibrates, and groundwater chemistry returns to steady-state conditions, which seems to be indicated by the current trend.

A study conducted by the EPA noted that increases in sulfate could occur through the gypsum content in bentonite and increases in chloride could occur from use of a public

water supply. For example, in 2023, the Heard County Water Authority (WSID#1490000) released a water quality report (HCWA, 2023) which showed that an average concentration of 1.58 mg/L of chlorine was detected in Heard County, Georgia public drinking water. Chlorine is added to public water for use as a disinfectant. Chlorine is extremely reactive and converts to chloride, as well as other compounds, when it reacts with other elements. Hence, chloride could increase if public water supply is used for mixing drilling fluids/grout. Both chloride and sulfate have increased in concentrations at GWC-35 since February 2023. However, both parameters are still low-level detections that are at similar concentrations to background monitoring well concentrations.

The calculated groundwater flow velocity for the Site during the July 2024 groundwater sampling event was approximately 0.48 feet per day. The distance between geotechnical boring GS-107 and GWC-35 is approximately 285 feet. Dividing the distance between GS-107 and GWC-35 (285 feet) by the average groundwater flow velocity for the Site (0.48 feet per day) gives a value of approximately 593 days which is the length of time for groundwater to flow from upgradient geotechnical boring GS-107 to downgradient groundwater monitoring well GWC-35. GS-107 was drilled in February 10, 2022. 593 days from February 10, 2022, would be September 26, 2023.

Boron was first observed at low concentrations in February 2023 and first exceeded the prediction limit in GWC-35 in August 2024. The timing of these detections is consistent with the estimated groundwater flow rate and travel times between the geotechnical borings and GWC-35. Groundwater flow is not uniform and factors like soil adsorption, dilution, irregularly spaced fractures, and variable soil consistency may alter travel times. Based on the groundwater flow velocity aligning closely with the expected arrival time from GS-107 to GWC-35 and given that boron concentrations at GWC-35 appear to be approaching a peak—indicative of a transient rather than ongoing condition—it is likely that elevated boron levels observed at this location result from naturally occurring boron in the subsurface. Specifically, the temporary increase in boron concentrations can be attributed to subsurface disturbance caused by drilling activities.

2.2.3. Geochemical Characterization

As stated in section 2.1.3 a boron SSI was also confirmed in GWC-14 during the February 2024 reporting period which has been attributed to an aboveground expansion joint failure and has been addressed by an EPD approved ASD. This incident has impacted GWC-14 with leachate that was being transferred from the return water pond through the return water dual wall pipes to the plant for operational purposes. If GWC-35 is being impacted from leachate from the landfill you would expect to see similarities in parameter concentrations between GWC-14 and GWC-35. However, as displayed in Table 2, Appendix III data for GWC-35 is closer in concentration magnitude to upgradient monitoring wells than to GWC-14. The detected concentrations for calcium, chloride, sulfate, total dissolved solids, and barium are orders of magnitude greater in GWC-14 than GWC-35. This suggests that GWC-35 is not being impacted by the CCR Unit. Additionally, leachate indicator parameters chloride and sulfate have

increased concentrations in recent events, however, these parameters are not calculated SSI concentrations which further indicates that GWC-35 is not being impacted by the CCR unit.

A preliminary review of the February 2025 semi-annual groundwater sample event data (included as Appendix B) indicates that indicator parameters are starting to level off or have already started to decrease. As depicted on Figure 10, total dissolved solids exhibited concentration increases after May 2023. However, TDS decreased from August 2024 to February 2025. TDS is the measure of the mass of solid material dissolved in a given volume of water. TDS can be comprised of cations (calcium, magnesium, potassium, sodium, etc.) and anions (chlorides, sulfates, etc.). This illustrates that the concentrations are likely peaking, or have peaked already, and are expected to decrease in upcoming sampling events. The dataset observed for GWC-35 is consistent with a one-time, transient event resulting from upgradient drilling activities.

2.2.4. Laboratory Calibration Issue

Following the February 2025 groundwater sample event, a batch data quality review was requested from Eurofins Environmental Testing Savannah (EET-SAV) for laboratory report J262079 for potential issues of lab contamination or high bias. The laboratory quality review request was based off of a method blank from this report, which showed a detectable concentration between the reporting limit (RL) and the method detection limit (MDL) for boron. Additionally, there were detectable concentrations of boron reported in 14 of the 17 samples in the laboratory report, which was unexpected based on historical data.

During the laboratory data quality review, EET-SAV determined that based upon the detection of boron in the method blank, all samples in laboratory report J262079 would be reanalyzed for boron with a new calibration in their inductive coupled plasma mass spectrometry instrument for analysis. The reanalysis results show that the detectable concentrations of boron were reduced to 6 of the 17 samples and that the actual concentration of boron decreased in 5 of 6 of those samples including the concentration of boron in GWC-35. While the current concentration of boron in GWC-35 is still above the prediction limit of 0.080 mg/L it demonstrates that boron results were biased high by the laboratory (before reanalysis). Laboratory calibration may be contributing to the increased boron concentration in GWC-35 during the February 2025 groundwater sampling event, supporting an error in sampling could be an alternate source in accordance with 40 CFR 257.94(e)(2). The revised laboratory report J262079 is included in Appendix B.

3.0 CONCLUSIONS AND RECOMMENDATIONS

The Plant Wansley Landfill's second semiannual detection monitoring event of 2024 identified verified SSIs for boron in GWC-9 and GWC-35. This ASD Addendum demonstrates that the original SSIs of boron at GWC-9 and GWC-35 are attributed to a previous operational issue related to dust suppression (GWC-9) and drilling activities that occurred directly upgradient of monitoring well GWC-35. Because the CCR Unit has a HDPE liner and leachate collection system, it is unlikely that the CCR Unit is the direct source of groundwater impact at GWC-9 or GWC-35. Ongoing concentrations of boron are attributed to natural variation in groundwater quality due to the lithological composition of water-bearing rocks at the Site that contain boron bearing minerals and their interaction with groundwater.

Lines of evidence that support this ASD conclusion include:

- Boron concentrations at GWC-9 have shown variability between 2016 to February 2024, with ranges from ND to 0.44 mg/L. Overall, the concentration of boron in GWC-9 has declined since November 2016, temporary peak value of 0.44 mg/L, which was attributed to a previous operation issue related to dust suppression water. The most recent boron concentration data from GWC-9 (February 2025) was lower than the site prediction limit and will not be calculated as an SSI for the 2025 semiannual groundwater sampling event.
- CCR has been completely removed from Cells 1 & 2 at the Landfill.
- Site groundwater geochemistry demonstrates similarity of water quality between GWC-9 and background conditions of upgradient wells, specifically GWA-2. Additionally, leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.
- Groundwater elevations of GWC-9 show an inverse correlation with boron concentrations, in which lower groundwater elevations may result in slightly higher concentrations of boron. This inverse correlation explains fluctuations in boron concentrations that are attributed to naturally derived sources from parent rock, as evidenced in the comparison of background concentrations of boron at the Ash Pond (0.10 mg/L) and Plant Wansley CCR Landfill (0.080 mg/L). The lithological composition of rocks at the Site contains boron, as shown in Figure 7. The leachability of boron in hard rock increases with longer contact times. The inverse relationship between groundwater elevation and the concentration of boron indicates an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9. The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron containing bedrock and fluctuations in groundwater elevation.
- During Site Acceptability field activities at Wansley Landfill, two geotechnical borings were installed directly upgradient of GWC-35. Both borings penetrated the granitic gneiss layer, a geological formation known to contain naturally occurring boron. Disturbance of this formation by drilling likely mobilized

naturally occurring boron, temporarily elevating boron concentrations in groundwater at GWC-35.

- The calculated average groundwater flow velocity from the July 2024 sampling event corresponds to the timeline of when the geotechnical borings were drilled to when boron is first detected in GWC-35.
- Laboratory high biased results were identified as an issue in laboratory report J262079. Boron was identified in the method blank as well as in 14 of the 17 samples, which was unexpected based on historical data. After reanalysis, boron was only detected in 6 of the 17 samples, and the actual concentration of boron deceased in 5 of 6 of those samples, including in GWC-35. Laboratory high biased results could be a contributing factor for the increased boron concentration in GWC-35 during the February 2025 groundwater sampling event

This ASD Addendum has been prepared pursuant to 40 CFR 257.94(e)(2). Based on the information presented in this ASD, groundwater monitoring at Plant Wansley Landfill will remain in detection monitoring. Detection monitoring results will continue to be presented in the Semiannual and Annual Groundwater Monitoring and Corrective Action Reports.

CERTIFICATION STATEMENT

I hereby certify that the information used in this alternate source demonstration for the coal combustion residuals (CCR) Unit located at Georgia Power's Plant Wansley located at 1371 Liberty Church Road, Carrollton, Georgia, and designated as the Coal Combustion By-Product Disposal Facility, is accurate pursuant to the requirements of 40 CFR §257.94(e)(2). I hereby certify that I am a qualified groundwater scientist, in accordance with the Georgia Rules of Solid Waste Management, and 40 CFR Part 258.50(g).

1.0 INTRODUCTION

This Alternate Source Demonstration (ASD) report has been prepared to address a statistically significant increase (SSI) identified in the groundwater monitoring network at the Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the Site) following the second semiannual detection monitoring event of 2023. The SSI was identified for Appendix III constituent boron at detection monitoring well GWC-9. An ASD addressing boron at GWC-9 was previously submitted to Georgia Environmental Protection Division (EPD) in 2018 (ACC, 2018). The complete 2018 ASD is provided as Appendix A. This ASD has been prepared pursuant to 40 Code of Federal Regulations (CFR) 257.94(e)(2).

The Site, located in northeast Heard County and southeast Carroll County, Georgia, is comprised of three cells within an approximate 73-acre footprint (Figure 1). The landfill is permitted to operate by the Georgia EPD Solid Waste Handling Permit No. 074-005D(CCR).

In August 2023, a semiannual detection monitoring event was conducted at the Site (ACC, January 2024) in accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 CFR 257 Subpart D; published in 80 Federal Register 21302-21501, April 17, 2015) and the Site, EPD approved, *Groundwater Monitoring Plan* (HHNT, 2022). As a result of the statistical analysis, performed by Groundwater Stats Consulting (GSC), an SSI for the Appendix III constituent boron was identified at detection groundwater monitoring well GWC-9 (See Figure 2 for the well location).

The concentration of boron in the sample from GWC-9 was 0.088 milligrams per liter (mg/L), slightly above the statistically derived site prediction limit of 0.080 mg/L. A verification resample was collected for boron in September 2023, which verified the SSI at a concentration of 0.13 mg/L. The statistical analysis of the August and September 2023 data was performed in accordance with the USEPA document Statistical Analysis of Groundwater Data at RCRA Facilities Unified Guidance (Unified Guidance) (USEPA, 2009).

GWC-9 was sampled again on February 19, 2024, for the first 2024 semiannual groundwater sampling event. The concentration of boron for that sampling event was 0.080 mg/L which equals the site prediction limit, and therefore, will not be calculated as a statistical exceedance for the 2024 semiannual groundwater event.

Since the submittal of the 2018 ASD (Appendix A), concentrations of boron in GWC-9 decreased to below the site prediction limit and boron exhibited a decreasing trend in this well since November 2016. However, the August and September 2023 concentrations of boron in GWC-9 increased to above the site prediction limit (see Figure 3 – Boron Time Series Plot for GWC-9). This ASD has been prepared to address the recent boron SSI in GWC-9.

2.0 ALTERNATE SOURCE DEMONSTRATION

This ASD builds on information provided in the 2018 ASD. Because the CCR Unit has a high-density polyethylene (HDPE) liner and leachate collection system, it is unlikely that the CCR Unit is the direct source of groundwater impact at GWC-9. Due to the lined CCR Unit and review of available Site data, the SSI reported for boron at well GWC-9 is not associated with a release from the CCR Unit. The following sections provide specific demonstrations to support this ASD such as a previous operational issue related to dust suppression and natural variation in groundwater quality.

2.1 Dust Suppression

As mentioned in the 2018 ASD (Appendix A), during drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond) for road dust suppression. This retention pond water had been treated prior to use for dust suppression; however, it may have exhibited slightly different chemical characteristics than the dust suppression water used during non-drought conditions. This may have accounted for the 2016 boron increases and subsequent decline after the drought ended, and the data supports this as the concentration of boron declined after 2017. An operational issue related to dust suppression is the likely source for the initial 2016 concentrations of boron found in GWC-9.

2.2 Natural Variation in Groundwater Quality

The low-level boron concentrations at GWC-9 have shown variability between 2016 through February 2024, with ranges from non-detect (ND) [March 2022] to 0.44 milligrams per liter (mg/L) [November 2016], as shown on Figure 3. Overall, the concentration of boron in GWC-9 has declined since the November 2016 peak value of 0.44 mg/L. GWC-9 was sampled on February 19, 2024, for the 2024 semiannual groundwater sampling event. The concentration of boron for that sampling event was 0.080 mg/L which equals the site prediction limit and illustrates the low-level nature of boron concentration at GWC-9. There is no maximum contaminant level (MCL) established for boron, but concentrations of boron in GWC-9 have been well below the USEPA Regional Screening Level of 4.0 mg/L. The February 2024 laboratory analytical data report J246863-1 is provided in Appendix B.

A review of Plant Wansley Ash Pond 1 data shows that the site background concentrations for boron at the Ash Pond is 0.10 mg/L (Georgia Power Company, 2024). This boron concentration was from monitoring well WGWA-18 (Figure 7) during the August 2021 sampling event. This background concentration is higher than the site background concentration for boron at the Plant Wansley CCR Landfill which is 0.080 mg/L. This demonstrates that background concentrations of boron at Plant Wansley, while low-level, are spatially variable. The initial boron concentration of 0.088 mg/L for GWC-9 during the second 2023 semiannual sampling period was below the site background at Ash Pond 1 and the most recent boron concentration data from GWC-9 (February 2024) was equal to the site prediction limit and, therefore, will not be calculated as a statistical increase at the Site.

The variation in the concentration of boron in GWC-9 may also be attributed to fluctuations in groundwater elevations. As shown on Figure 4, boron concentrations in GWC-9 show an inverse correlation when compared to minor changes in groundwater elevations. As groundwater elevations decrease, the concentration of boron increases and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9 (Appendix C), as discussed in the following section. Leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.

2.3 Geochemical Characterization

The Piper diagram on Figure 5 was created from the groundwater data collected during the February 2024 semiannual sampling event. Displayed on the figure is a highlighted section in which typical CCR leachate would plot on the diagram based upon fine ash leaching research (Zielke-Olivier and Vermeulen 2019). Figure 5 shows that the water types displayed by the upgradient groundwater wells and downgradient groundwater well GWC-9 data are generally similar and are not indicative of CCR source water. As demonstrated in the figure, the data for GWC-9 is similar to the data for upgradient well GWA-2. In general, the data for GWC-9 plots in similar areas of the diagram as the rest of the upgradient monitoring wells at the Site and in a different area than typical coal ash leachate.

GWC-14 was included in Figure 5 for comparison purposes. A boron SSI was also confirmed in GWC-14 during the August 2023 reporting period. However, the boron SSI in GWC-14 has been addressed by an August 2022 ASD Addendum, which has been approved by Geogia EPD. The cause of the SSIs for GWC-14 has been attributed to an aboveground expansion joint failure that was directly upgradient of GWC-14. This incident has impacted GWC-14 with leachate that was being transferred from the return water pond through the return water dual wall pipes to the plant for operational purposes. If GWC-9 is being impacted from leachate from the landfill you would expect to see similarities in the water type between GWC-9 and GWC-14. However, as displayed in Figure 5, GWC-9 does not plot near GWC-14 and instead plots similarly to background wells at the Site. The water type displayed for GWC-14 plots closer to the typical coal ash leachate area of the diagram. This suggests that GWC-9 is not being impacted by the CCR Unit.

Stiff diagrams in Figure 6 generally support the data derived from the Piper plots in Figure 5, showing water types not indicative of CCR leachate. Bicarbonate ions are similar in upgradient well GWA-2 and downgradient well GWC-9, suggesting similar natural groundwater type in both upgradient and downgradient wells. Additionally, as with Figure 5, GWC-14 has been included in Figure 6 for comparison purposes. The stiff diagrams for GWC-9 and GWC-14 do not display similarities which further suggests that GWC-9 is not being impacted by the CCR Unit.

The United States Geological Survey (USGS) National Geochemical Database (NGDB) shows that the USGS took several hard rock samples at locations around Plant Wansley in 1967, which predates waste placement at the Wansley Landfill. USGS

sample locations AEW095, AEW096, AEW087, and AEW088 all contained boron at concentrations of 50, 20, 50, and 10 parts per million (ppm) by weight, respectively. Of those locations, AEW095 and AEW096 are located nearest Wansley Landfill, as shown in Figure 7, and are within, or near, the same geological layer (granitic gneiss) for GWC-9. Uppin and Karro (2013) state that one factor controlling the groundwater chemistry is the lithological composition of water-bearing rocks and that the presence of boron bearing minerals in the host rock and their interaction with water are considered to be the main cause of boron enrichment in groundwater. The leachability of boron increases at longer contact times and is also influenced by the mixing speed and/or liquid-to-solid ratio (Tabelin *et. al*., 2013). The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron-containing bedrock and fluctuations in groundwater elevation. As stated in the previous section, as groundwater elevations decrease, the concentration of boron increases, and vice versa. This correlation may be indicative of an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9.

3.0 CONCLUSIONS AND RECOMMENDATIONS

The Plant Wansley Landfill August 2023 Statistical Analysis report identified a verified SSI for boron in GWC-9. This ASD demonstrates that the original SSI of boron at GWC-9 is attributed to a previous operational issue related to dust suppression. Ongoing concentrations of boron are attributed to natural variation in groundwater quality due to the lithological composition of water-bearing rocks at the Site that contain boron bearing minerals and their interaction with groundwater.

Lines of evidence that supports this ASD conclusion include:

- Boron concentrations at GWC-9 have shown variability between 2016 to February 2024, with ranges from ND to 0.44 mg/L. Overall, the concentration of boron in GWC-9 has declined since the November 2016 temporary peak value of 0.44 mg/L, which was attributed to a previous operation issue related to dust suppression water. The most recent boron concentration data from GWC-9 (February 2024) was equal to the site prediction limit and will not be calculated as an SSI for the 2024 semiannual groundwater sampling event.
- Site groundwater geochemistry demonstrates similarity of water quality between GWC-9 and background conditions of upgradient wells, specifically GWA-2. Additionally, leachate indicator parameters chloride and sulfate have not been detected at SSI concentrations which further indicates that GWC-9 is not being impacted by the CCR unit.
- Groundwater elevations show an inverse correlation with boron concentrations, in which lower groundwater elevations may result in slightly higher concentrations of boron. This inverse correlation explains fluctuations in boron concentrations that are attributed to naturally derived sources from parent rock, as evidenced in the comparison of background concentrations of boron at the Ash Pond (0.10 mg/L) and Plant Wansley CCR Landfill (0.080 mg/L).

- The lithological composition of rocks at the Site contain boron. The leachability of boron in hard rock increases with longer contact times and is also influenced by the mixing speed interaction and/or liquid-to-solid ratio. The inverse relationship between groundwater elevation and the concentration of boron indicates an interaction occurring between a geological layer and lower groundwater elevation near the screened interval of GWC-9. The variation in the concentrations of boron at GWC-9 may be influenced by the leachability of boron containing bedrock and fluctuations in groundwater elevation.

Based on the information presented in this ASD, groundwater monitoring at Plant Wansley Landfill will remain in detection monitoring. Detection monitoring results will continue to be presented in the Semiannual and Annual Groundwater Monitoring and Corrective Action Reports.

SECTION 1
Introduction

This document presents an alternate source demonstration (ASD) for statistically significant increases (SSIs) as identified in the 2017 Annual Groundwater Monitoring and Corrective Action Report submitted on January 31, 2018. This ASD has been prepared pursuant to 40 CFR 257.94(e)(2), which states that "the owner/operator may demonstrate that a source other than the coal combustion residual (CCR) unit caused the statistically significant increase over background levels for a constituent or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality."

Georgia Power Company (GPC) – Plant Wansley CCR Landfill (the site) is located in northeast Heard County and southeast Carroll County on Liberty Church Road, approximately 12 miles southeast of the City of Carrollton. The plant property encompasses approximately 5,100 acres and the landfill is permitted to operate by the Georgia Environmental Protection Division (EPD) [Permit No. 074-005D(L)(I)]. The disposal facility is comprised of three cells within an approximate 73-acre disposal footprint. Figure 1, Plant Wansley CCB Disposal Facility Site Location Map, depicts the site location referenced to regional landmarks. The facility has received only flue gas desulfurization gypsum waste from GPC – Plant Wansley to date: however, a recently approved permit modification will allow for all forms of CCR to be disposed in the future.

In accordance with the United States Environmental Protection Agency (USEPA) CCR rule (40 Code of Federal Regulations [CFR] 257 Subpart D; published in 80 FR21302-21501, April 17, 2015), the facility prepared the *2017 Annual Groundwater Monitoring and Corrective Action Report* to document groundwater monitoring activities conducted at the site and satisfy the requirements of §257.90(e). Groundwater monitoring and reporting for the site is performed in accordance with the monitoring requirements §257.90 through §257.98. In that report, SSIs were identified as follows:

- Boron: GWC-9 and GWC-14
- Chloride: GWC-14
- Fluoride: GWC-32

SECTION 2
Alternate Source Demonstration

As allowed by §257.94(e)(2), the site may demonstrate that a source other than the CCR unit caused the SSI for a constituent or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. This report demonstrates an alternate source for SSIs of constituents included in Appendix III of 40 CFR. §257 identified following analysis of the first detection monitoring event data. SSIs were identified for three groundwater monitoring network wells (GWC-9, GWC-14, and GWC-32). Two of these locations (GWC-9 and GWC-14) were previously identified has having SSIs under state permitting requirements. The SSIs at these locations were addressed in an EPD-approved ASD completed in 2017. This ASD builds on information provided in the 2017 document to address the newly required Appendix III constituents. There are conditions unique to each individual well where one or more SSIs were identified at the site. Therefore, the following sections provide specific demonstrations, by well, to support that the site is not the source of the SSI. A recent potentiometric surface map is provided for reference as Figure 2, Plant Wansley CCB January 2018 Potentiometric Surface Map.

2.1 GWC-9

2.1.1 SSI Identification

One Appendix III analyte (boron) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 0.12 milligrams per liter (mg/L) reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 0.05 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was confirmed at a concentration 0.10 mg/L.

2.1.2 Data Review

Background monitoring was initiated in 2016 and continued through 2017. As shown in Figure 3, Boron Time Series Plot for GWC-9, the concentration of boron was reported at trace levels during the initial rounds of background monitoring (estimated "J" values of 0.0635J and 0.0981J mg/L March and May 2016, respectively). An increase in concentration to 0.26 mg/L was reported in July 2016 and continued until reaching a maximum level of 0.44 mg/L in November 2016. The concentration declined to 0.11 mg/L in January 2017 and remained in a range of 0.071 to 0.12 mg/L for the duration of 2017. The well was most recently sampled in January 2018 as part of the first 2018 semi-annual monitoring event required by the current solid waste permit. The January 2018 concentration of 0.044J mg/L was less than the site prediction limit of 0.050 mg/L.

Other Appendix III parameter trends were reviewed in order to gain insight into the source of the boron increase and subsequent decline. Based on a review of these data, chloride, total

dissolved solids (TDS) and to a lesser extent calcium exhibit trends similar to boron. All of these analytes showed increases in late 2016 reaching maximum levels during the November 2016 event then subsequently declining to near the original early 2016 levels. Time series plots for these analytes are provided in Figure 4 (Chloride Time Series Plot for GWC-9), Figure 5 (TDS Time Series Plot for GWC-9) and Figure 6 (Calcium Time Series Plot for GWC-9).

Water level and precipitation data were also reviewed. The increasing analyte trends correspond to a period of relative drought. According the National Oceanic and Atmospheric Administration (NOAA) the average annual precipitation for Carrolton, Georgia is 51.4 inches. The University Georgia College of Agricultural & Environmental Sciences maintains a statewide weather monitoring network including a Plant Wansley station. Data from the Plant Wansley station indicate that 2016 was a significantly drier than average year with total precipitation of 39.6 inches. Conversely, both 2015 and 2017 were wetter than average with respective totals of 60.2 and 69.7 inches. The period between September 19 and November 28, 2016 was notably dry in that no precipitation event greater than 0.1 inches occurred. As shown in Figure 7, Groundwater Elevation and Boron Time Series Plot for GWC-9, the dry weather during late 2016 coincides with lower water groundwater elevations and higher boron concentrations at GWC-9.

2.1.3 Alternate Source Review

Based on a review of the facility's Design and Operation Plans and recent aerial photographs, direct leakage from the cell area is highly improbable. Very limited gypsum slurry has been directed into Cell 2 and the small amount that has been is located on the opposite side of the cell approximately 1200 feet from GWC-9. The landfill is a fully lined unit including a 60-mil thick high-density polyethylene (HPDE) liner underlain by a geosynthetic clay liner (GCL), a 6-inch layer of compacted clay (maximum permeability of 1 x 10^{-5} cm/sec), and structural fill. Two sedimentation basins and a return water pond capture all leachate, sluice water and storm water run-off generated in the lined cell areas.

Storm water runoff from the perimeter gravel road has occurred near GWC-9 (uphill from the pump booster station), as evidenced by erosion rills in the vicinity. The gravel road is not anticipated to be a significant source of impact; however, the road is serviced by water trucks used for dust suppression. During drought conditions present in 2016, the facility opted to minimize water usage from typical sources by utilizing water from the NPDES discharge pond (retention pond). Water from this pond has been treated prior to release. However, it may exhibit slightly different chemical characteristics than the dust suppression water used during non-drought conditions (i.e. potentially accounting for the boron and chloride increases and subsequent decline after the drought ended). An operational issue related to dust suppression is a potential source.

2.1.4 Natural Variation in Groundwater Quality

As discussed in Section 2.1.2, an increasing trend in the concentrations of boron, chloride and TDS occurred during a period of relative drought in 2016. Concentrations diminished

during a return of wetter weather during 2017 Lower groundwater elevations have the potential to result in fluctuations in the concentrations of naturally occurring analytes (i.e. groundwater is less diluted by rainwater during periods of relative drought). As shown in Figure 7 there appears to be an inverse relationship between the groundwater elevation and boron concentration. Therefore, a natural variation in groundwater quality is also a potential source.

2.1.5 Summary and Recommendations

The CCR unit is not the apparent source of the boron SSI. The lined landfill was constructed to prevent direct impact to groundwater and there is no waste in close proximity to the well. Dry weather conditions that occurred in 2016 indicate the possibility that a natural variation in groundwater quality occurred. Additionally, recent data indicate that conditions have returned to background levels and concentrations are no longer at SSI levels. The monitoring well should remain in detection monitoring as the assessment trigger is no longer present and an alternate source was identified.

2.2 GWC-14

2.2.1 SSI Identification

Two Appendix III analytes (boron and chloride) were identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as SSIs at this location. The respective concentrations of 0.95 and 160 mg/L for boron and chloride reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limits of 0.05 mg/L (boron) and 23 mg/L (chloride). A verification resample was collected on December 1, 2017 and the exceedances were verified at concentrations of 1.2 and 150 mg/L for boron and chloride, respectively.

2.2.2 Data Review

The concentration ranges for boron and chloride have shown variability during monitoring. As shown in Figure 8, Boron Time Series Plot for GWC-14 and Figure 9, Chloride Time Series Plot for GWC-14, the range of boron concentrations is 0.29 to 1.2 mg/L and chloride 46 to 180 mg/L. However, even at the low end of the ranges the concentrations are above site background conditions.

2.2.3 Alternate Source Review

Groundwater monitoring well GWC-14 is located directly downhill and downgradient from the return water pond, return water pumps, and electrical control building. Effluent is transferred from the return water pond to the return water lines that connect to the plant where it is recycled for operations.

There have been historical operational issues in this area. An unpermitted discharge due to the failure of an HDPE expansion joint on the return water pipe occurred on August 30, 2014. The Georgia Environmental Protection Division was immediately verbally notified and

subsequently provided written notification. The facility made immediate repairs and also began to evaluate long-term corrective actions. The pond was temporarily taken out-of-service to allow repairs to be made beginning in early 2015. The concrete headwall, HDPE liner and soil berm were removed to expose the buried return water piping leading from the return water pond to the pumps. Repairs to the piping, liner and headwall were completed in early 2017. The pond is now fully repaired and functional.

2.2.4 Summary and Recommendations

The CCR unit is not the direct source of the boron and chloride SSIs. The apparent source is a return water piping failure that was identified and addressed. The facility completed repairs to the return water pond and piping in 2017 that will prevent future releases from occurring and thus allowing boron and chloride concentrations to eventually return to background levels. The monitoring well should remain in detection monitoring as an alternate source was identified.

2.3 GWC-32

2.3.1 SSI Identification

One Appendix III analyte (fluoride) was identified in the *2017 Annual Groundwater Monitoring and Corrective Action Report* as a SSI at this location. The concentration of 3.4 mg/L reported in the sample collected during the October 2017 detection monitoring event exceeded the site prediction limit of 3.2 mg/L. A verification resample was collected on December 1, 2017 and the exceedance was verified at a concentration of 3.4 mg/L.

2.3.2 Data Review

Concentrations of fluoride ranged from 2.1 to 3.9 mg/L in samples collected from GWC-32 during background monitoring. The concentrations reported during the compliance event and verification resample were within this range. Several nearby monitoring wells also produced consistent detections of fluoride (e.g. GWA-28, GWA-29, GWC-27, GWC-31 and GWC-33). Two of these locations, GWA-28 and GWA-29 are upgradient from Cell 3 and are used to characterize background conditions. Concentrations at these locations ranged from 1.4 to 3.2 mg/L during background monitoring. The site prediction limit of 3.2 mg/L was based on these data (i.e. maximum concentration reported in background).

Reported fluoride concentrations in multiple upgradient and downgradient wells at Cell 3, which has not yet been used for CCR disposal, are likely derived from a natural source in the underlying bedrock. The boring logs from these locations provided in Appendix A, Boring Logs, indicate that GWA-28, GWA-29, GWC-27, GWC-31, GWC-32, and GWC-33 are at least partially screened in a common lithology, the Long Island Creek Gneiss. This lithology is localized to this portion of Plant Wansley. Rock units encountered in other portions of the site include: biotite gneiss (easily differentiated from the Long Island Creek Gneiss by greater abundance of mafic minerals), quartzite, schist units and amphibolite units. As shown in Figures 1 and 2, these well locations are adjacent to each other. It is noted that

one location in this area, GWC-30 did not produce fluoride detections. However, this location is differentiated from the others in that it is screened in overburden rather than bedrock. A time series plot depicting fluoride concentrations at these locations is provided as Figure 10, Fluoride Time Series Plot for Cell 3 Monitoring Wells.

2.3.3 Alternate Source Review

Groundwater monitoring well GWC-32 is adjacent to Cell 3. This cell is not contiguous with Cells 1 and 2 and has never received waste. Therefore, the CCR unit is not the apparent source.

2.3.4 Natural Variation in Groundwater Quality

Based on the commonality of the localized lithology, the Long Island Creek Gneiss was identified as a potential source of fluoride in groundwater samples from GWC-32 and other nearby locations. Identification of a natural bedrock source of fluoride is supported by the following evidences from (A) fluoride analysis in rock samples and (B) the major ionic concentrations in groundwater for evaluation of the chemical composition of groundwater.

A. ACC obtained core samples from the plant and/or SCS storage of three distinct site lithologies: Long Island Creek Gneiss, schist/amphibolite and quartzite. Core sample fragments were shipped to TestAmerica Pensacola for analysis of fluoride by EPA Method 9056. It should be noted that this laboratory method only accounts for water soluble fluoride and not concentrations present in the rock matrix. The actual whole rock concentration of fluoride is likely to be much higher. The sample results are summarized in Table 1 and the laboratory analytical report is included in Appendix B, Laboratory Analytical Results & Purge Data Sheets.

TABLE 1. Rock sample fluoride concentrations.

Sample Identification	Fluoride Concentration (mg/Kg)
PB-3 Long Island Gneiss 56-57’	11
PB-4 Long Island Gneiss 49-50’	9.3
PB-8 Schist/Amphibolite 123-124’	<1.3
PB-9 Schist/Amphibolite 65-66’	3.4J
APC-5D Quartzite 90-91’	<1.3

Notes:
1. mg/Kg = milligrams per kilogram
2. “J” = reported concentration is less than laboratory reporting limit and considered estimated.

The results confirm that there is a significantly higher concentration of fluoride in the Long Island Creek Gneiss relative to other site lithologies that were analyzed. Therefore, wells screened in this unit may be more likely to produce detections of fluoride. Concentrations of fluoride are likely to be somewhat variable within the Long Island Creek Gneiss and wells screened in this formation may show different levels of fluoride in

groundwater. It is likely that GWC-32 is screened in a zone of slightly greater fluoride concentrations than the upgradient locations.

B. On March 15 -16, 2018 ACC personnel sampled GWA-28, GWA-29, GWC-27, GWC-31, and GWC-32 for a suite of cations (calcium, magnesium, sodium, and potassium) and anions (carbonate, bicarbonate, sulfate, and chloride). The samples were collected using standard site sampling techniques and submitted to TAL-Pensacola for analysis. The analytical data are presented as Piper Plot and Stiff Diagrams. As shown in Figure 11, Piper Plot for Cell 3 Monitoring Wells and Figure 12, Stiff Diagrams for Cell 3 Monitoring Wells, there are no significant differences in the major ionic concentrations of the samples (i.e. all are low level and indicative of background conditions). This indicates that the chemical composition of groundwater between upgradient and downgradient locations are relatively similar in the vicinity of Cell 3. Therefore, all of these locations appear to represent background conditions as would be anticipated with a cell that has not received waste. The laboratory report and field purge logs are provided in Appendix A.

2.3.5 Summary and Recommendations

The CCR unit is not the source of the fluoride SSI. The apparent source is natural variability in groundwater. Testing of the rock unit present beneath a portion of Cell 3, the Long Island Creek Gniess confirm that fluoride concentrations in this unit are higher than at least two other rock units present in other areas of the site. A Piper Plot and Stiff Diagrams confirm that there are no significant differences in cation/anion ratios between any of the Cell 3 wells tested. Cell 3 has yet to receive waste, therefore the geochemical similarity between all locations is consistent with what would be anticipated. Groundwater monitoring location GWC-32 should remain in detection monitoring based on the identification of the alternate source.

SECTION 3
Conclusions and Recommendations

The *2017 Annual Groundwater Monitoring and Corrective Action Report* was prepared to satisfy the requirements of §257.90(e). In that report SSIs were identified for three groundwater monitoring locations: GWC-9 (boron), GWC-14 (boron and chloride) and GWC-32 (fluoride). This ASD has identified the following sources for each location with a SSI:

- GWC-9
    - A source other than the CCR unit caused the SSI (no waste placement near the well; operational issue)
    - Natural variation in groundwater quality (drought condition)
- GWC-14
    - A source other than the CCR unit caused the SSI (operational issue and repair)
- GWC-32
    - A source other than the CCR unit caused the SSI (no waste placement near the well)
    - Natural variation in groundwater quality (natural occurrence in rock formation)

All locations have met the requirements for a demonstration listed in §257.94(e)(2). Therefore, all locations should remain in detection monitoring at this time. Detection monitoring results should continue to be presented in the Annual Groundwater Monitoring and Corrective Action Reports, as well as state semi-annual groundwater monitoring reports.

PAGE 1 OF 1

SOUTHERN COMPANY

LOG OF TEST BORING

SOUTHERN COMPANY SERVICES, INC.
EARTH SCIENCE AND ENVIRONMENTAL ENGINEERING

PROJECT Plant Wansley
LOCATION Carrollton, Georgia

DATE STARTED 2/22/2011 **COMPLETED** 2/22/2011 **SURF. ELEV.** Not Surveyed **COORDINATES:**
CONTRACTOR Boart Longyear **EQUIPMENT** **METHOD** Rotosonic
DRILLED BY **LOGGED BY** G. Dyer **CHECKED BY** **ANGLE** **BEARING**
BORING DEPTH 43 ft. **GROUND WATER DEPTH: DURING** **COMP.** **DELAYED** 19.4 ft. after 24 hrs.
NOTES Well installed. Refer to well data sheet.

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	SAMPLE TYPE NUMBER	SAMPLE DEPTH (ft.)	BLOW COUNTS (N VALUE)	RECOVERY % (RQD)	COMMENTS
		Silty Sand (SM) - orange, damp, low plasticity, w/ gravel sized pieces of quartz - quartz is angular - sample is weathered from schist, some clay found (approximately 10%), micas weathering to white clay minerals					
5		- orange, slightly damp, orange grading down to white; fewer clay minerals (approximately 5%), sediment is less consolidated than 0' - 4' section. white material is highly weathered schist, relic cleavages and foliations can barely be discerned					no quartz, orange grades to white.
		Schist					perched 8' - 10' H2O.
10		- white, tan, has weathered to medium grained sands w/ less than 10% silt, wet					
		- mottled tan, brown, weathered, coarse sand to gravel sized, poorly sorted and graded, gravel sized pieces are structually intact schist. grades to more tan, sand and gravel sized regolith, preferential bands of more competent schist found (dark), dry					
15							
		- banded tan, orange, white, weathered, coarse sand to gravel sized, white sediments contain larger fragments of schist, dry					tan. orange. white/grey.
		Silty Sand (SM)					
20		- tan, wet, medium grain					
		Poorly-graded Sand (SP) - mottled white, tan, orange, dry, fine to medium grain, w/ angular, gravel sized schist fragments					
25		**Silty Sand (SM)** - mottled tan, white, dry, clay particles present less than 2%, angular gravel to boulder sized fragments of schist					
		Partially Weathered Rock					
30		- brown, orange, saprolite (schist/gneiss contact), zoned					
		Gneiss - banded grey, white, competent, relic structures and foliations intact, sugary pegmatic quartz coating on cuttings, prevalent zones of oxidation suggesting fractures, fractures identified parallel to cleavage planes					last 10' drilled w/ water.
35							
40							
45		Bottom of borehole at 43.0 feet.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	N/A	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	15.1°C IR7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
400-150979-1

HPLC/IC
Method(s) 300.0: The method blank for analytical batch 391935 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 300.0: The method blank for analytical batch 392174 contained Sulfate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Metals
Method(s) 6020: The matrix spike (MS) recoveries for preparation batch 392217 and analytical batch 393106 were outside control limits. Insufficient spike in the matrix spike is suspected. The associated laboratory control sample (LCS) and post digestion spike (PDS) recoveries are within acceptance limits.

Method(s) 6020: The sample size used in the preparation of the matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 392217 and analytical batch 393106 was outside the 20% difference. As the relative percent difference (RPD) calculation is based upon the MS/MSD concentration as opposed to the MS/MSD percent recovery, elevated %RPD values were obtained.

General Chemistry
Method(s) SM 2320B: The sample duplicate precision for the following sample associated with analytical batch 391494 was outside control limits: (400-150979-A-2 DU). The associated Laboratory Control Sample(LCS) met acceptance criteria.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	4.4°C IR8
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Accreditation/Certification Summary

Client: Southern Company
Project/Site: CCR - Plant Wansley

TestAmerica Job ID: 400-150979-1
SDG: Gypsum Landfill Cells

Laboratory: TestAmerica Pensacola

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

ANALYTICAL REPORT

PREPARED FOR

Attn: Robert (Trey) Singleton
Southern Company
3535 Colonnade Parkway
Bin S 530 EC
Birmingham, Alabama 35243

Generated 3/7/2024 3:56:05 PM

JOB DESCRIPTION

Plant Wansley Landfill

JOB NUMBER

680-246863-1

Eurofins Savannah
5102 LaRoche Avenue
Savannah GA 31404

See page two for job notes and contact information.

my EOL

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Southern Company
Project/Site: Plant Wansley Landfill

Job ID: 680-246863-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Sample Summary

Job Narrative
680-246863-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

- Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Receipt
The samples were received on 2/16/2024 10:03 AM, 2/17/2024 9:52 AM, 2/22/2024 10:19 AM and 2/24/2024 9:52 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 0.1°C, 0.9°C, 1.3°C, 1.8°C, 1.9°C, 3.0°C and 3.2°C.

HPLC/IC
Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/35) The data has been reported.
Chloride 86%
Fluoride 80%
Sulfate 79%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/49) The data has been reported.
Chloride 89%
Fluoride 83%
Sulfate 82%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/66) The data has been reported.
Chloride 89%
Fluoride 82%
Sulfate 82%

Method 300_ORGFM_28D: LCS/LCSD recovered outside the established limit of 90% for sulfate at 84% and 86%. (LCS 680-825238/100) and (LCSD 680-825238/99) The data has been reported.

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825241/66) The data has been reported.
Chloride 89%
Fluoride 82%
Sulfate 82%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825241/86) The data has been reported.
Chloride 82%
Fluoride 77%
Sulfate 76%

Method 300_ORGFM_28D: : LCS/LCSD recovered outside the established limit of 90%: (LCS 680-825241/102) and (LCSD 680-825241/101) The data ha been reported.
Chloride 83% / 84%
Fluoride 83% / 86%
Sulfate 77% / 77%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/35) The data has been reported.
Chloride 86%

Fluoride 80%
Sulfate 79%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825238/49) The data has been reported.
Chloride 89%
Fluoride 83%
Sulfate 82%

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: . (CCV 680-825238/66) The data has been reported.
Chloride 89%
Fluoride 82%
Sulfate 82%

Method 300_ORGFM_28D: : LCS/LCSD recovered outside the established limit of 90% for sulfate at 84% and 86%. (LCS 680-825238/100) and (LCSD 680-825238/99) The data has been reported.

Method 300_ORGFM_28D: The CCV recovered outside the established limit of 90%: (CCV 680-825241/66) The data has been reported.
Chloride 89%
Fluoride 82%

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C: A lesser volume of sample was used for the following samples due to the nature of the sample matrix resulting in elevated reporting limits: WAN-GWA-4 (680-246863-3), WAN-LF-FD-04 (680-246863-8), WAN-GWC-5 (680-246877-1), WAN-GWC-12 (680-247011-3), WAN-GWC-14 (680-247011-5), and WAN-GWC-7 (680-247150-1).

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-823340 was outside control limits: (680-246830-C-1 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

Method 2540C: The sample duplicate precision for the following sample associated with analytical batch 680-823618 was outside control limits: (680-246862-E-17 DU). The associated Laboratory Control Sample / Laboratory Control Sample Duplicate (LCS/LCSD) precision met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Southeast, LLC Project Manager.

Definitions/Glossary

Client: Southern Company
Project/Site: Plant Wansley Landfill

Job ID: 680-262079-1

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Narrative
680-262079-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Receipt
The samples were received on 2/21/2025 11:00 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 1.9°C and 2.3°C.

HPLC/IC
Method 300_ORGFM_28D: The native sample, matrix spike, and matrix spike duplicate (MS/MSD) associated with analytical batch 680-877077 were performed at the same dilution. Due to the additional level of analyte present in the spiked samples, the concentration of Chloride and Sulfate in the MS/MSD was above the instrument calibration range. The data have been reported and qualified.

Method 300_ORGFM_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for analytical batch 680-877077 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method 300_ORGFM_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and precision for analytical batch 680-877229 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory sample control duplicate (LCS/LCSD) precision was within acceptance limits.

Method 300_ORGFM_28D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 680-877353 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Metals
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry
Method 2540C: A lesser volume of sample was used for the following samples due to the nature of the sample matrix resulting in elevated reporting limits: WAN-WGC-12 (680-262079-1) and WAN-WGC-14 (680-262079-2).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Client Sample ID: WAN-GWC-12

Accreditation/Certification Summary

Client: Southern Company
Job ID: 680-262079-1
Project/Site: Plant Wansley Landfill

Laboratory: Eurofins Savannah

The accreditations/certifications listed below are applicable to this report.

Authority	Program	Identification Number	Expiration Date
Florida	NELAP	E87052	06-30-25
Georgia	State	E87052	06-30-25

Method Summary

Client: Southern Company
Project/Site: Plant Wansley Landfill

Job ID: 680-262079-1

Method	Method Description	Protocol	Laboratory
300.0-1993 R2.1	Anions, Ion Chromatography	MCAWW	EET SAV
6020B	Metals (ICP/MS)	SW846	EET SAV
7470A	Mercury	SW846	EET SAV
2540C-2011	Total Dissolved Solids (Dried at 180 °C)	SM	EET SAV
3005A	Preparation, Total Recoverable or Dissolved Metals	SW846	EET SAV
7470A	Preparation, Mercury	SW846	EET SAV

Protocol References:

MCAWW = "Methods For Chemical Analysis Of Water And Wastes", EPA-600/4-79-020, March 1983 And Subsequent Revisions.

SM = "Standard Methods For The Examination Of Water And Wastewater"

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Boring Logs

SOUTHERN COMPANY

LOG OF TEST BORING

SOUTHERN COMPANY SERVICES, INC.
EARTH SCIENCE AND ENVIRONMENTAL ENGINEERING

PROJECT Plant Wansley
LOCATION Carrollton, Georgia

DATE STARTED 2/23/2011 COMPLETED 2/23/2011 SURF. ELEV. 709.71 COORDINATES: N - 1238673.12, E - 2027891.35
CONTRACTOR Boart Longyear EQUIPMENT _____ METHOD Rotosonic
DRILLED BY _____ LOGGED BY G. Dyer CHECKED BY _____ ANGLE _____ BEARING _____
BORING DEPTH 16.5 ft. GROUND WATER DEPTH: DURING _____ COMP. _____ DELAYED 4.2 ft. after 20 hrs.
NOTES Well installed. Refer to well data sheet.

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	SAMPLE TYPE NUMBER	SAMPLE DEPTH (ft.)	BLOW COUNTS (N VALUE)	RECOVERY % (RQD)	COMMENTS
		Silt (SM) - tan, brown, wet, low to medium plasticity, fine sand; few gravel sized pieces of quartz, clay fraction = 10%					
5		**Poorly-graded Sandy Gravel (SP)** - mottled tan, brown, dark grey, moist, low plasticity, medium to coarse grain, w/ gravel, gravel is comprised of quartz/gneissic fragments, some clay (approximately 9%)					
10		**Gneiss** - grey, white, hard, very competent, MOP iron oxide staining, some gold staining, quartz and feldspar bands 2" thick - grey, white, hard, very competent, small amounts of iron staining w/ some gold staining, no fractures					
15		**Poorly-graded Gravel (GP)** - zone of angular gravel, oxide staining					gravel resembles that of stream bed.
		Gneiss - grey, white, hard, some oxide staining, competent Bottom of borehole at 16.5 feet.					
20							

NOTE:
Elevation in feet North American Vertical Datum of 1988 (NAVD).
Coordinates are in North American Datum of 1983 (NAD83)
Georgia State Plane East Zone.
Well resurveyed in December 2020.

LOG OF TEST BORING

SOUTHERN COMPANY SERVICES, INC.
EARTH SCIENCE AND ENVIRONMENTAL ENGINEERING

PROJECT Plant Wansley
LOCATION Carrollton, Georgia

DATE STARTED 2/7/2011 COMPLETED 2/7/2011 SURF. ELEV. Not Surveyed COORDINATES:
CONTRACTOR Boart Longyear EQUIPMENT METHOD Rotosonic
DRILLED BY LOGGED BY G. Dyer/ D. Brooks CHECKED BY ANGLE BEARING
BORING DEPTH 38 ft. GROUND WATER DEPTH: DURING COMP. DELAYED
NOTES Well installed. Refer to well data sheet.

DEPTH (ft)	GRAPHIC LOG	MATERIAL DESCRIPTION	HCL REACTION (Weak / Moderate / Strong)	COMMENTS
		Clayey Sand (SC) - black (10YR 2/1) moist, very fine to fine grained		
5		**Clayey Sand (SC)** - light red / moderate reddish orange (10R 6/6) wet, medium plasticity, very fine grained sand		
10		**Silty Sand (SM)** - pale brown (10YR 6/3) saprolite some relic structures 10'-12' - SM: brown (7.5YR 4/3) saprolite 12'-15'		
15		- SM: brown (7.5YR 4/3) SAA except micaceous		
20		**Poorly-graded Gravel with Clay (GP-GC)** - dusky red / dark reddish brown (10R 3/4) fine grained sand with quartz gravel		
25		**(PWR)** - brown (7.5YR 4/3) saprolite SAND, silty and micaceous		
		Clayey Sand (SC) - brown (7.5YR 4/3) micaceous with large quartz pebbles		
30		**(PWR)** - dark gray (10YR 4/1) saprolite wet, SAND, silty, clayey with highly weathered GNEISS		
35		**GNEISS**		
40		Bottom of borehole at 38.0 feet.
