Intrawell Parametric

Background Data Summary (based on natural log transformation): Mean=-4.232, Std. Dev.=0.6277, n=24, 4.167% NDs. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.9208, critical = 0.884. Kappa = 2.76 (c=16, w=29, 1 of 2, event alpha = 0.05132). Report alpha = 0.0001135.

Constituent: Zinc Analysis Run 4/14/2025 5:14 PM View: Appendix I - Intrawell
Plant Wansley Client: Southern Company Data: Wansley Landfill

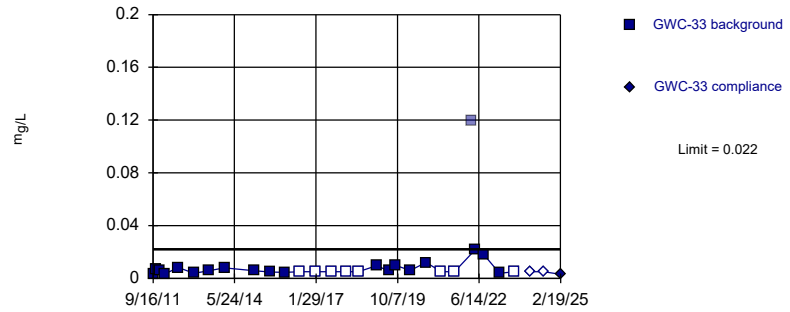
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 27 background values. 29.63% NDs. Well-constituent pair annual alpha = 0.004998. Individual comparison alpha = 0.002502 (1 of 2).

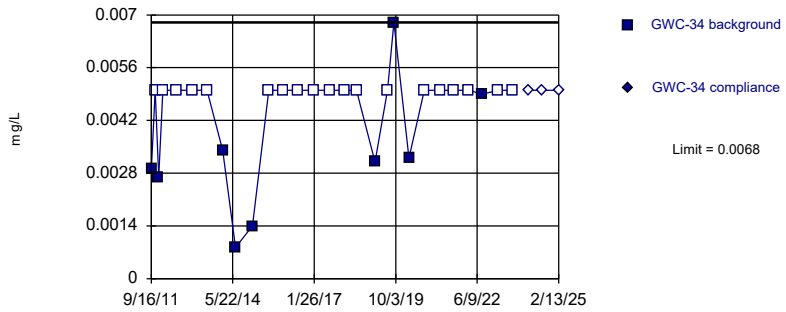
Constituent: Zinc Analysis Run 4/14/2025 5:14 PM View: Appendix I - Intrawell
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 28 background values. 67.86% NDs. Well-constituent pair annual alpha = 0.004669. Individual comparison alpha = 0.002337 (1 of 2).

Constituent: Zinc Analysis Run 4/14/2025 5:14 PM View: Appendix I - Intrawell
Plant Wansley Client: Southern Company Data: Wansley Landfill

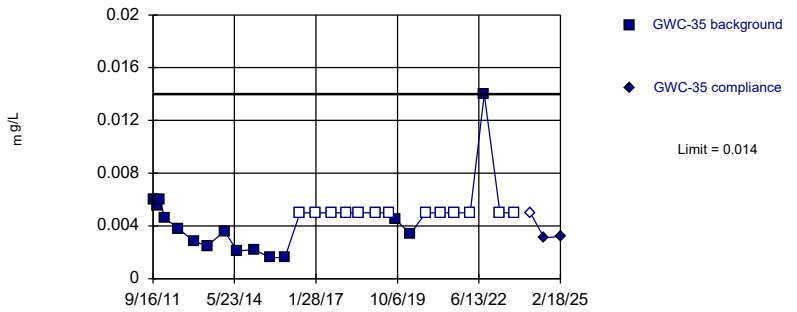
Within Limit

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 28 background values. 46.43% NDs. Well-constituent pair annual alpha = 0.004669. Individual comparison alpha = 0.002337 (1 of 2).

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Within Limit

Prediction Limit

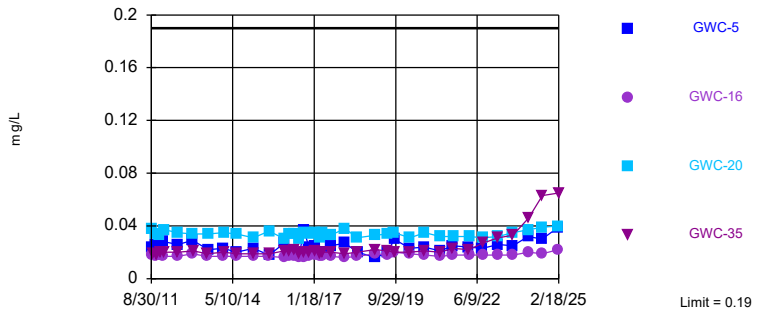
Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 205 background values. 14.15% NDs. Annual per-constituent alpha = 0.002834. Individual comparison alpha = 0.00004893 (1 of 2). Comparing 4 points to limit. Assumes 25 future values.

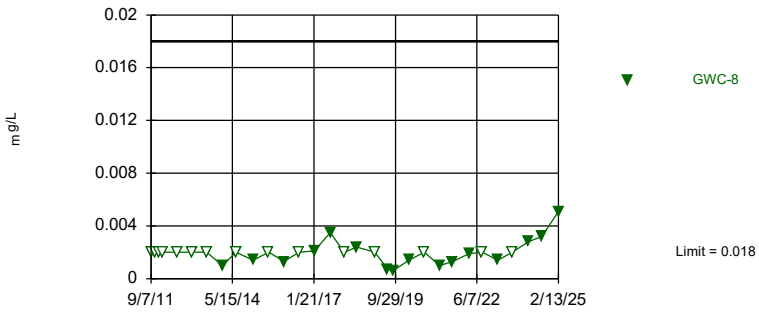
Constituent: Barium Analysis Run 4/7/2025 10:20 PM View: Appendix I - Interwell - Two Step
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 173 background values. 72.25% NDs. Annual per-constituent alpha = 0.003803. Individual comparison alpha = 0.00006569 (1 of 2). Assumes 28 future values.

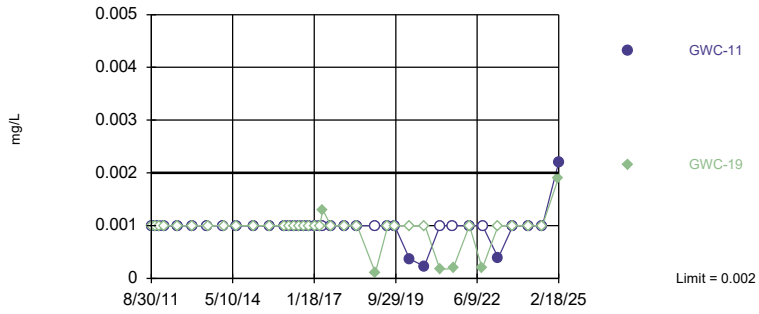
Constituent: Copper Analysis Run 4/7/2025 10:20 PM View: Appendix I - Interwell - Two Step
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-11

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 205 background values. 92.2% NDs. Annual per-constituent alpha = 0.002834. Individual comparison alpha = 0.00004893 (1 of 2). Comparing 2 points to limit. Assumes 27 future values.

Constituent: Lead Analysis Run 4/7/2025 10:20 PM View: Appendix I - Interwell - Two Step
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG

Within Limits

Prediction Limit

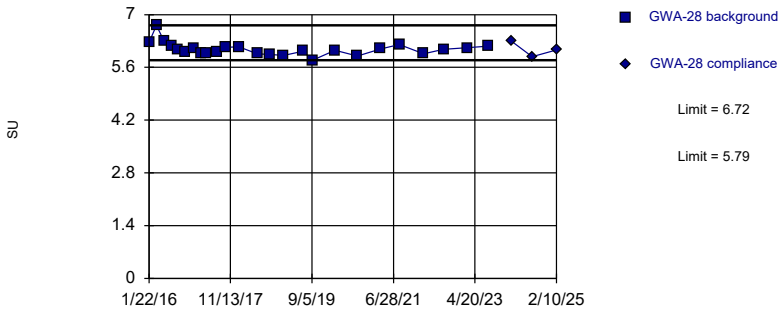
Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limits are highest and lowest of 25 background values. Well-constituent pair annual alpha = 0.01131. Individual comparison alpha = 0.005664 (1 of 2).

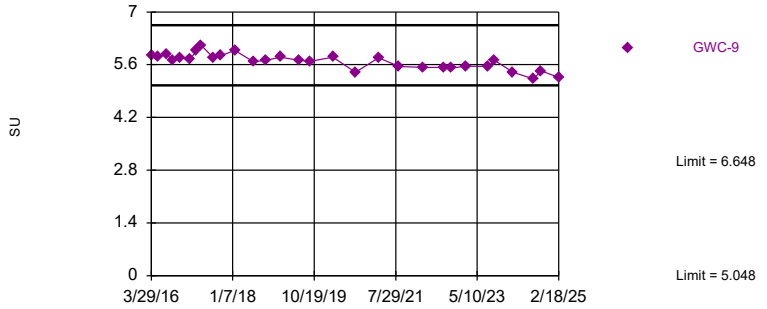
Interwell Parametric



Background Data Summary: Mean=5.848, Std. Dev.=0.3669, n=157. Normality test: Chi Squared @alpha = 0.01, calculated = 8.669, critical = 14.07. Kappa = 2.181 (c=7, w=29, 1 of 2, event alpha = 0.05132). N exceeds UG tables; Kappa based on n=150. Report alpha = 0.007498. Individual comparison alpha = 0.0001297. Assumes 28 future values.

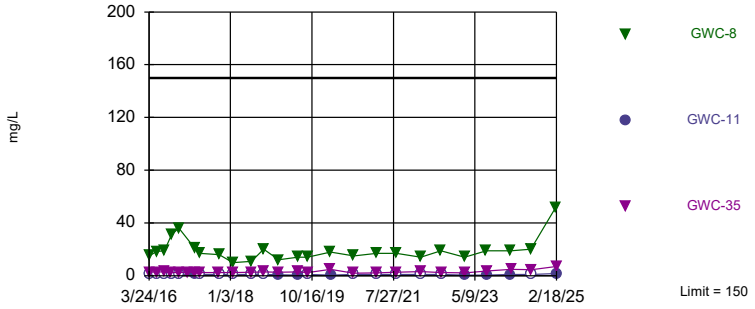
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 148 background values. 16.89% NDs. Annual per-constituent alpha = 0.005176. Individual comparison alpha = 0.00008947 (1 of 2). Comparing 3 points to limit. Assumes 26 future values.

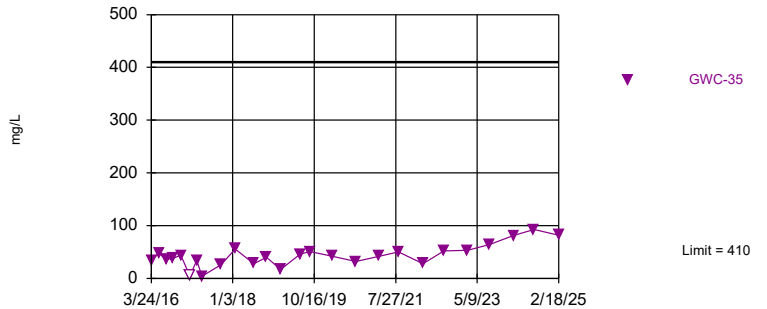
Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 147 background values. 6.803% NDs. Annual per-constituent alpha = 0.005242. Individual comparison alpha = 0.00009061 (1 of 2). Assumes 28 future values.

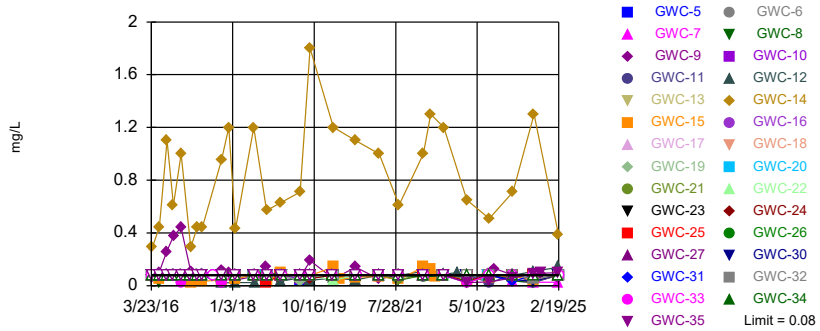
Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Exceeds Limit: GWC-12, GWC-14, GWC-35

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 148 background values. 97.3% NDs. Annual per-constituent alpha = 0.005176. Individual comparison alpha = 0.00008947 (1 of 2). Comparing 29 points to limit.

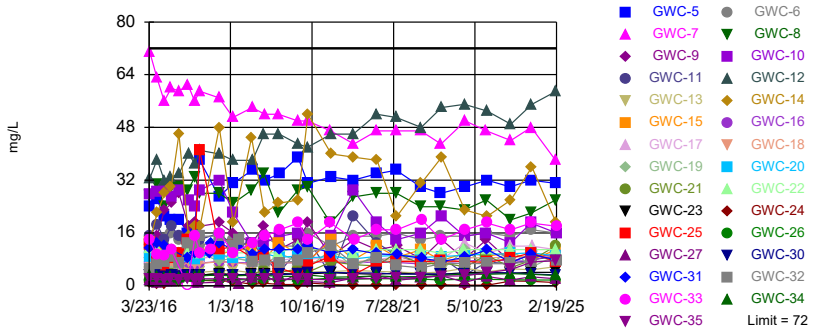
Constituent: Boron Analysis Run 4/15/2025 11:06 AM View: Appendix III - Interwell
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.0.24 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Interwell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Chi Squared normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 149 background values. Annual per-constituent alpha = 0.005111. Individual comparison alpha = 0.00008834 (1 of 2). Comparing 29 points to limit.

Constituent: Calcium Analysis Run 4/15/2025 11:06 AM View: Appendix III - Interwell

Statistical Analysis Reports
August 2025 Monitoring Event

GROUNDWATER STATS CONSULTING

January 30, 2026

Southern Company Services
Attn: Mr. Trey Singleton
241 Ralph McGill Blvd NE, Bin 10160
Atlanta, Georgia 30308

Re: Plant Wansley Landfill – August/October 2025 Statistical Analysis

Dear Mr. Singleton,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the August/October 2025 Semi-Annual Groundwater Monitoring Statistical summary of the statistical analysis of groundwater data for Georgia Power Company's Plant Wansley Landfill. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals (CCR) from Electric Utilities (CCR Rule, 2015), the Georgia Environmental Protection Division (EPD) Rules for Solid Waste Management Chapter 391-3-4-.10, and follows the United States Environmental Protection Agency (USEPA) Unified Guidance (2009).

Sampling began for the CCR program in 2016, and for the State program in 2011 in accordance with the Georgia EPD's Solid Waste Permit. An exception includes downgradient well GWC-10 which was first sampled in 2016 for both CCR and State programs. At least 8 background samples have been collected at each of the groundwater monitoring wells. Semi-annual sampling is performed in accordance with the Georgia Department of Natural Resources, Environmental Protection Division groundwater monitoring regulations; and the August/October 2025 samples are evaluated in this report.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** GWA-1, GWA-2, GWA-3, GWA-4, GWA-28, and GWA-29
- **Downgradient wells:** GWC-5, GWC-6, GWC-7, GWC-8, GWC-9, GWC-10, GWC-11, GWC-12, GWC-13, GWC-14, GWC-15, GWC-16, GWC-17, GWC-18, GWC-19, GWC-20, GWC-21, GWC-22, GWC-23, GWC-24, GWC-25, GWC-26, GWC-27, GWC-30, GWC-31, GWC-32, GWC-33, GWC-34, and GWC-35

While downgradient well GWC-24 has had periods of being historically dry, this well has been consistently sampled over the past few years.

Data were sent electronically to Groundwater Stats Consulting, and the statistical analysis was reviewed by Andrew Collins, Project Manager for Groundwater Stats Consulting. The analysis is prepared according to the recommended statistical methodology prepared in the Fall 2017 by Dr. Kirk Cameron, PhD Statistician with MacStat Consulting, primary author of the USEPA Unified Guidance.

The following constituents were evaluated:

- **CCR Appendix III -** boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Georgia EPD Appendix I -** antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc

Note that when there are no detections present in downgradient wells for a given constituent, statistical analyses are not required. A summary of Appendix I well/constituent pairs with 100% non-detects follows this letter.

Time series plots for Appendix I and III parameters at all wells are provided for the purpose of screening data at these wells (Figure A). Additionally, a separate section of box plots is included for all constituents at upgradient and downgradient wells (Figure B). The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells. Values in background which have been flagged as outliers may be seen in a lighter font and as a disconnected symbol on the graphs. A summary of flagged outliers follows this report (Figure C).

Due to varying detection limits in background data sets due to improved laboratory practices, a substitution of the most recent reporting limit is used for all non-detects. Note that for calculation of intrawell prediction limits, substitution of the most recent reporting limit is performed separately for each well/parameter pair. In some cases, the

reporting limit provided by the laboratory contained varying limits for a given parameter; therefore, the substitution may differ from well to well and may result in slight changes in statistical limits between sample events. Substitution of the most recent reporting limit generally gives the most conservative limit in each case. As a result of elevated historic reporting limits for silver at upgradient well GWA-29, the most recent reporting limit of 0.001 mg/L was substituted across all wells for silver to construct statistical limits that are conservative from a regulatory perspective and are representative of current groundwater quality conditions.

In earlier analyses, data at all wells were evaluated for the following: 1) outliers; 2) trends; 3) most appropriate statistical method based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods were recommended. Power curves were provided previously, based on a 1-of-3 resample plan for Appendix I constituents and a 1-of-2 resample plan for Appendix III constituents, to demonstrate that the selected statistical methods for the parameters listed above comply with the USEPA Unified Guidance and the Georgia Environmental Protection Division Rules for Solid Waste Management Chapter 391-3-4-.10. During the background update in March 2022, sufficient samples were available for Appendix I constituents to provide sufficient power using a 1-of-2 resample plan and a power curve was provided with that report. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations. Power curves were based on the following:

Georgia EPD Appendix I Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan (all parameters)
- # Constituents: 16
- # Downgradient wells: 29

CCR Appendix III Constituents:

- Semi-Annual Sampling
- Intrawell Prediction Limits with 1-of-2 resample plan – (pH, sulfate, and TDS)
- Interwell Prediction Limits with 1-of-2 resample plan – (boron, calcium, chloride, and fluoride)
- # Constituents: 7
- # Downgradient wells: 29

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. When data cannot be normalized or the majority of data are non-detects, a nonparametric test is utilized. While the false positive rate associated with the parametric limits is based on an annual 10% (5% per semi-annual event) as recommended by the EPA Unified Guidance (2009), the false positive rate associated with the nonparametric limits is dependent upon the available background sample size, number of future comparisons, and verification resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (US EPA, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% non-detects (USEPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects, the Kaplan-Meier non-detect adjustment is applied to the background data for parametric limits. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% non-detects.

Natural systems continuously evolve due to physical changes made to the environment. Examples include capping a landfill, paving areas near a well, or lining a drainage channel to prevent erosion. Periodic updating of background statistical limits is necessary to accommodate these types of changes. In the interwell case, prediction limits are updated with upgradient well data during each event after careful screening for any new outliers. In the intrawell case, data for all wells and constituents may re-evaluated when a minimum of 4 new data points is available to determine whether earlier concentrations are representative of present-day groundwater quality. In some cases, an earlier portion of data is deselected prior to construction of limits to provide sensitive limits that will rapidly detect changes in groundwater quality. Even though the data are excluded from the calculation, the values will continue to be reported and shown in tables and graphs.

Two-Step Statistical Analysis

Intrawell statistical methods, combined with 1-of-2 plan, may be used as a conservative first step for identifying potential facility impacts in downgradient wells. Intrawell methods

use background data for individual wells and may be overly sensitive to variation. In particular for nonparametric limits with small background sample sizes, the probability of a false positive is higher than the desired annual sitewide rate of 10%. Therefore, exceedances may occur as a result of spatial variation rather than facility impacts. A second step can be used to further evaluate those exceedances and reduce the overall number of SSIs that result from spatial variation. In instances where intrawell statistical methods identify an apparent SSI, a second step of interwell statistical evaluation may be used to determine whether the measurement exceeds the sitewide background limit based on pooled upgradient well data. This is similar in concept to the procedure used in compliance monitoring programs where an interwell statistical limit is used to determine "background" (USEPA Unified Guidance (2009), Chapter 7, Section 7.5). For the detection monitoring program, if the result does not exceed sitewide (interwell) background, an SSI is not declared.

When the result exceeds the sitewide (interwell) background, the 1-of-2 resample plan allows for collection of an independent resample to confirm or disconfirm the initial finding. A statistically significant increase is not declared unless all resamples also exceed the intrawell prediction limit (United State Environmental Protection Agency (USEPA) Unified Guidance, March 2009, Chapter 19). When the resample confirms the initial exceedance, further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). When any resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. In cases where intrawell and interwell exceedances are noted and no resamples are collected, the initial exceedance will be considered a confirmed statistically significant increase (SSI).

Trend tests, in addition to interwell prediction limits, are recommended for well/constituent pairs found to have an initial intrawell SSI. Trend analysis will provide for detection of long-term changes and potential facility impacts at a given well in cases where the concentrations at that well remain below the sitewide upgradient limits. Thus, the two-step approach has additional capability to detect long-term changes at downgradient wells compared to interwell methods alone. While a trend may be identified by visual inspection, a quantification of the trend and its significance is needed to identify whether concentrations are statistically significantly increasing, decreasing, or remaining stable over time. The absence of a statistically significant increasing trend indicates that an initial intrawell exceedance is short-term and may be the result of spatial variation rather than facility impact to groundwater. If a facility impact has occurred, it will likely result in additional exceedances in future sampling events. When a statistically significant increasing trend is noted, additional data may be needed to demonstrate that there is reasonable evidence that the initial intrawell statistical exceedance is a result of spatial

variation rather than a result of impact to groundwater quality downgradient of the facility.

Background Screening Summary – Georgia EPD Appendix I and CCR Appendix III Constituents – Conducted in February 2024

Outlier Analysis

Prior to updating background data, Tukey's outlier test and visual screening were used to evaluate data through August 2023 at all wells for Appendix I and III constituents tested using intrawell methods and through February 2024 on pooled upgradient well data for Appendix III constituents tested using interwell methods. While Tukey's test identified several outliers, only the most extreme values were flagged in the database, such as the highest values for pH at wells GWC-21, GWC-23, GWC-24, GWC-34, and GWC-35, the lowest value for pH at well GWC-23, and the highest value for TDS at well GWC-23. All other measurements appeared to be representative of variation in both upgradient and downgradient wells or resulted from reported trace values compared to non-detect measurements within a record. Other values that were flagged but not identified by Tukey's test such as the highest values for cobalt at well GWC-33, for silver at upgradient well GWA-29 and at downgradient well GWC-6, and for zinc at well GWC-9, were identified visually and flagged as outliers in order to obtain statistical limits that are conservative (lower) from a regulatory perspective. No changes were made to previously flagged values in upgradient wells for constituents evaluated using interwell prediction limits.

As mentioned above, flagged data are displayed in a lighter font and as a disconnected symbol on the time series reports, as well as in a lighter font on the accompanying data pages. An updated summary of flagged outliers follows this letter (Figure C).

Mann-Whitney Evaluation

For constituents requiring intrawell prediction limits (all Appendix I constituents and pH, sulfate, and TDS for the Appendix III constituents), the Mann-Whitney (Wilcoxon Rank Sum) test was used to compare the medians of historical data through August 2021, to new compliance samples at each well through August 2023. Previously truncated records were also compared to more recent data through August 2023. Any records that were truncated during previous updates due to concentrations that were not representative of present-day groundwater quality conditions used curtailed portions of the respective record for comparison with the Mann-Whitney test. Discussions of any truncated records were included in previous background update reports.

If the medians of the two groups are not significantly different at the 99% confidence level, background data are typically updated to include the newer compliance data. The Mann-Whitney test identified statistically significant differences for the following well/constituent pairs:

Appendix I:

- Antimony: GWA-1 (upgradient), GWC-13, GWC-20
- Barium: GWC-12, GWC-34, GWC-35, and GWC-8
- Cadmium: GWA-28 (upgradient), GWC-13, GWC-19, GWC-21, GWC-31, GWC-34, GWC-7, and GWC-9
- Cobalt: GWC-11 and GWC-5
- Lead: GWC-13, GWC-16, and GWC-7
- Nickel: GWA-2, GWA-4 (both upgradient), and GWC-26
- Vanadium: GWC-18
- Zinc: GWC-32

Appendix III:

- pH: GWC-9
- Sulfate: GWC-10, GWC-12, GWC-32, GWC-33, and GWC-7
- TDS: GWC-7

The majority of these differences for both Appendix I and Appendix III resulted from reported trace values compared to non-detect results within a given record. In some cases, while the median of the compliance data was identified as significantly different from the background median, the reported concentrations in more recent data were similar to those reported historically. Examples include barium in wells GWC-12, GWC-34, and GWC-8; pH in well GWC-9; sulfate in well GWC-32; and zinc in well WC-32. Therefore, all records were updated through August 2023. An exception is for barium in downgradient well GWC-35 where an increasing trend was observed among compliance data; therefore, this record was not updated with data through August 2023.

Additionally, the historical portion of the records for cobalt at wells GWC-11 and GWC-5; sulfate in wells GWC-10, GWC-33, and GWC-7; and TDS in well GWC-7 were truncated to use the more recent portion of the records with lower reported concentrations than those reported historically within each record. This step serves to provide prediction limits that are conservative (i.e., lower) from a regulatory perspective.

Regarding the statistically significant increase in medians for sulfate at downgradient well GWC-12, the historical portion of the record was truncated to use more recent and stable measurements for construction of an intrawell prediction limit. The slight increase in low-

level measurements is, reportedly, attributed to an above-ground expansion joint failure which occurred on a return water pipe in the area in 2014 rather than a result of an impact from the regulated lined landfill.

A summary of background date ranges for these well/constituent pairs, along with other well/constituent pairs with truncated records, follows this letter. All records for constituents using intrawell methods will be re-evaluated during the next background update as discussed earlier.

Upgradient Well Trend Tests – Interwell

The Sen's Slope/Mann Kendall trend test was used to evaluate data at upgradient wells for each of the parameters tested using interwell prediction limits—boron, calcium, chloride, and fluoride (Appendix III) to identify statistically significant increasing or decreasing trends in background at the 99% confidence level. The following statistically significant trends were noted:

Increasing:

- Calcium: GWA-1 and GWA-28
- Chloride: GWA-3

Decreasing:

- Chloride: GWA-29
- Fluoride: GWA-29

The majority of identified significant trends were marginal relative to the average concentrations; therefore, no adjustments were required. Truncation of upgradient well records to remove trends should be done with caution since the higher concentrations could appear in future years at downgradient wells in the absence of facility impacts.

Statistical Analysis of Georgia EPD Appendix I Constituents – August/October 2025

Intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. The most recent sample from the same well is compared to its respective background. This statistical method removes the element of variation from across wells and eliminates the chance of mistaking spatial variation for a release from the facility.

In cases where downgradient average concentrations are higher than observed upgradient concentrations for a given constituent where intrawell analyses are recommended, the current assumption is that this is due to variation rather than a result of practices at the landfill. Validation of this assumption requires a separate analysis or investigation that is beyond the scope of this data screening study. However, for this site, the pre-waste data support the assumption of variation rather than impacts of the landfill.

Intrawell Prediction Limits

Intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all available data through August 2023, except for the cases mentioned above, for each well with detections (Figure D). No statistical analyses were required for well/constituent pairs with 100% non-detects. The August/October 2025 compliance data are compared to the intrawell background limits.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of an additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e., impact from the site, natural variation, or an off-site source). If the resample falls within the statistical limit, the initial exceedance is considered to be a false positive result, and no further action is necessary. A summary of the Georgia EPD prediction limits follows this report. Note that the reporting limits for antimony, arsenic, beryllium, cadmium, chromium, cobalt, nickel, vanadium, and zinc at several wells changed during this analysis and resulted in slight changes to previously established intrawell prediction limits. No significant changes occurred as a result of the most recent reporting limits. Exceedances were noted for the following well/constituent pairs:

- Barium: GWC-16, GWC-18, and GWC-35
- Nickel: GWC-9 and GWC-14
- Zinc: GWC-9

Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data through August/October 2025 to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure E). The following exceedances were identified:

- Nickel: GWC-9 and GWC-14

Trend Test Analysis – Appendix I Constituents

Data from downgradient well/constituent pairs for Appendix I constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure F). Upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and the following statistically significant trends were identified:

Increasing
- Barium: GWA-4 (upgradient), GWC-16, GWC-18, and GWC-35
- Nickel: GWC-14
- Zinc: GWA-28 (upgradient)

Decreasing
- Nickel: GWA-1, GWA-2, GWA-4, and GWA-29 (all upgradient)
- Zinc: GWA-29 (upgradient)

Statistical Analysis of CCR Appendix III Parameters – August/October 2025

As mentioned above, intrawell limits constructed from carefully screened background data from within each well serve to provide statistical limits that are representative of the background data population, and that will rapidly identify a change in more recent compliance data from within a given well. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to determine whether apparent exceedances are present.

A previously flagged low value for pH at well GWC-23 was confirmed during the previous analysis. For chloride, fluoride, and sulfate, however, elevated reporting limits among wells GWC-31 and GWC-33 during the September 2017 event were flagged as outliers during the previous analysis since the reporting limits were significantly higher than any detected observations within the respective records. Similarly, a high trace value for sulfate at well GWC-31 during the September 20217 event was also previously flagged as an outlier in order to maintain statistical limits that are conservative from a regulatory perspective. These values will be re-evaluated during the next background update.

Background (upgradient) well data used to construct interwell prediction limits were reassessed for potential outliers during this analysis and no new values were flagged. No additional values were flagged during this analysis.

Intrawell Prediction Limits

For sulfate, pH, and TDS, intrawell prediction limits, combined with a 1-of-2 resample plan, were constructed using all historical data through August 2023 except for cases mentioned above, (Figure G). Additionally, for all well/constituent pairs except those mentioned previously, the August/October 2025 samples were compared to established statistical limits. Exceedances were noted for the following well/constituent pairs:

- Sulfate: GWA-2 (upgradient), GWC-8, GWC-18, GWC-20, and GWC-35
- TDS: GWC-35

Two-Step Approach

Following the two-step analysis procedure, interwell prediction limits were then constructed using pooled upgradient well data August/October 2025 to evaluate the initial intrawell prediction limit exceedances for the downgradient well/constituent pairs mentioned above (Figure H). No exceedances were identified.

Interwell Prediction Limits

For boron, calcium, chloride, and fluoride which are evaluated using all historical upgradient well data through August/October 2025 to construct interwell prediction limits combined with a 1-of-2 resample plan (Figure I). The following statistically significant increases were identified:

- Boron: GWC-9, GWC-12, GWC-14, and GWC-35
- Chloride: GWC-14

Trend Test Analysis – Appendix III Constituents

Data from downgradient well/constituent pairs for Appendix III constituents found to exceed their respective prediction limit are further evaluated using the Sen's Slope/Mann Kendall trend test at the 99% confidence level along with upgradient wells for the same constituents (Figure J). As mentioned above, upgradient wells are included in the trend analyses for all parameters found to exceed their prediction limit in downgradient wells to identify whether similar patterns exist upgradient of the site. Such patterns are an

indication of variability in groundwater unrelated to practices at the site. A summary of the trend test results follows this letter and the following statistically significant trends were identified:

Increasing
- Chloride: GWA-1 (upgradient)
- Sulfate: GWA-2 (upgradient)
- TDS: GWC-35

Decreasing
- Chloride: GWA-29 (upgradient)

Summary

Based on the statistical analyses of the August/October 2025 observations for Appendix I and III constituents, the following downgradient prediction limit exceedances were identified:

Appendix I:
- Nickel: GWC-9 and GWC-14

Appendix III
- Boron: GWC-9, GWC-12, GWC-14, and GWC-35
- Chloride: GWC-14

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Wansley Landfill. If you have any questions or comments, please feel free to contact us.

Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Parametric

Background Data Summary (based on square root transformation) (after Kaplan-Meier Adjustment): Mean=0.03772, Std. Dev.=0.01685, n=29, 27.59% NDs. Normality test: Shapiro Wilk @alpha = 0.01, calculated = 0.8988, critical = 0.898. Kappa = 2.665 (c=16, w=29, 1 of 2, event alpha = 0.05132). Report alpha = 0.0001135.

Constituent: Cobalt Analysis Run 10/27/2025 2:59 PM View: Appendix I - Intrawell

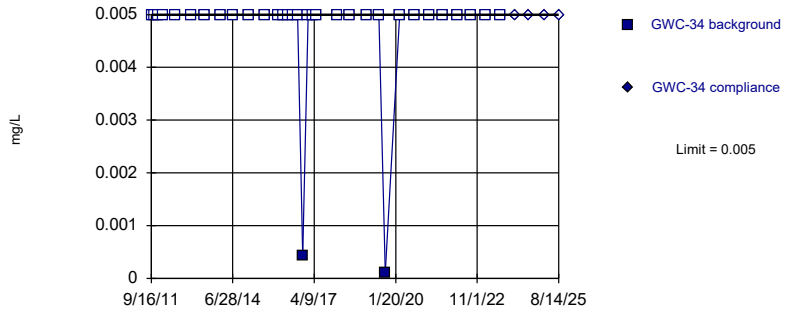
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because censored data exceeded 50%. Limit is highest of 33 background values. 93.94% NDs. Well-constituent pair annual alpha = 0.003399. Individual comparison alpha = 0.001701 (1 of 2).

Constituent: Cobalt Analysis Run 10/27/2025 3:00 PM View: Appendix I - Intrawell

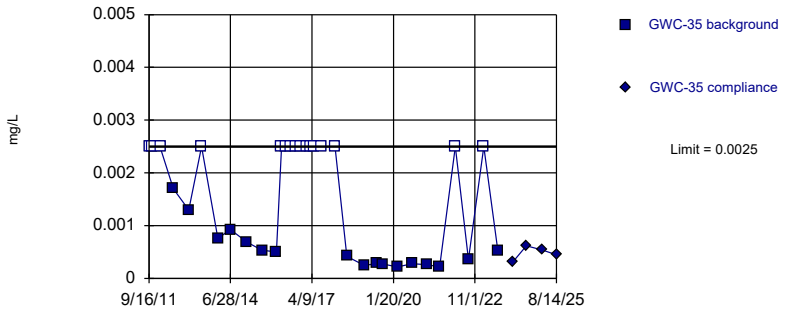
Plant Wansley Client: Southern Company Data: Wansley Landfill

Sanitas™ v.10.1.02 Software licensed to Groundwater Stats Consulting. UG
Hollow symbols indicate censored values.

Within Limit

Prediction Limit

Intrawell Non-parametric



Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 34 background values. 47.06% NDs. Well-constituent pair annual alpha = 0.003195. Individual comparison alpha = 0.001599 (1 of 2).

Constituent: Cobalt Analysis Run 10/27/2025 3:00 PM View: Appendix I - Intrawell
